ONCE A WEEK.

THE SILVER CORD.

BY SHIRLEY BROOKS.

CHAPTER LXXIV.

MRS. HAWKESLEY TO HER HUSBAND.

MY DEAREST CHARLES,

* * * * *

All which you know without my telling it.

And now for serious matters. Be sure that you read this letter when you are by yourself, and be quite sure that you make out every word in it before you destroy it,—not exactly an unnecessary request, as your remembrance will tell you.

Poor Bertha has been exceedingly ill, and is so still, although Dr. Solmes considers that there is no immediate danger. But the fever has only

excited her frightfully, and has not made her light-headed, as I expected it would do. She insists upon talking, and the irritation into which she is thrown by being desired to be silent is perhaps more dangerous than the permitting her to speak. If she is left alone, she at once rings the bell so violently that the whole house is alarmed, and I dare not tie the rope up out of her way, or, feeble as she is, I believe that she would crawl out of her room, and do herself some fearful mischief. If it were not for this state of things, I should have refused to hear anything from her upon the terrible subject; but what can I do? And it is better that she should pour out her incoherent confidences to me than to any one else. I write in her room, interrupted by her incessantly, and therefore you must do your best to make out my meaning, and I write as fast as I can at the risk of saying the same thing over again; but you are used to that in me.

My dearest Charles, I know not how—and the more I consider it the less I know how—to separate the truth from the idle talk which flows from Bertha's lips hour after hour. Such a mixture of the most solemn and the most frivolous things I never heard, and it is very difficult to believe her in the full possession of her senses. Yet she is so minutely accurate about small matters, and recollects the tiniest point about dress, or ornament, or any sight she has seen, or any stranger she has met, that it is a hard struggle to believe that when she breaks out into revelations that I cannot even hint at, she is inventing or wandering. Is there any form of mental disease in which the sufferer's mind cannot grasp anything beyond trifles? While I write the words, they recal a curious speech you yourself once made, in which you said that perhaps when we get into the next world we should discover that we had never had the resolution really to open our eyes at all in this, and so had never seen the angels and ghosts all round us, but only felt our way along. Bertha seems never to have looked out firmly upon life, but to have contented herself with what was quite close to her, just as baby, when you sat her down for the first time by the sea, and you expected her to be astonished and delighted with the waves, pulled her little hat over her eyes and filled her lap with the stones, and you were disappointed. My dear Charles, bear with my scribbling. I feel that I try to keep away from a painful theme.

I cannot arrive at a decision. But you know this already, because you know my ways, and that you would have had it in the very first line of my letter if I had been certain. I have gone over and over everything that Bertha has said and keeps on saying, and have put it in all shapes and forms, and yet I cannot weave it all into one connected story. That E. A. is the most fearfully wicked man who ever lived there cannot be a shadow of a doubt, and that poor Bertha is all that we have been forced to believe, I wish I could say was in the least degree made doubtful. I cannot write about this, and I need not. But I cannot, from all that she has said, and from all that I can bring out of it when she allows me time to think for myself—I cannot make out the true character of R. U.'

No one could esteem him so highly as you did, and I am sure that I was always ready to accept your estimate of him, and to suppose that you understood him better than a woman could do. And do not think that any representations of Bertha's would have weight with me against your judgment, or that I am unconsciously allowing an erring wife to make me listen to any extenuations which she may try to find in the character of her husband. It is not from anything that she says against him (and it is very little indeed that I ever permit her to say upon the subject), that a strange impression is fixing itself into my mind. If I am to believe what she says—I mean, dear, the actual facts which she tells—I must say, and please forgive me if I put the case too abruptly against your friend, that—I scarcely like to write it—but if R. had desired to make known all about E. A. very much sooner, *the proofs were within his reach.*

Reading over these last lines, and having broken off to attend to my patient, I am not satisfied with them; and you must let me put what I mean in plainer words. Did not R. know of all that had taken place long before he chose to make others aware that it had come to his knowledge? You told me what he had said to poor Arthur when sending him home. Charles, if R. were *not* then in the dark as to his own household misery!

You will reject this thought at the first reading; but do you think that I would have put it on paper if I could have justified to myself the not writing it to you? Because it is a very shocking thought, and because it is far more terrible when we come to connect it with what has happened since. Please to think over all this as calmly as you would do, if you were sitting by my side, which I wish more than I can tell you that you were, at such a time. I know your faith in R. U. and God knows that I would be the last to try to shake it; but if he is your friend, remember that Laura is my sister, and let me speak as freely for her as you would do for him.

You have thought over it, dearest, and in spite of my assurance that Bertha, ill as she is now, and childish as she is at the best of times, is perfectly capable of bearing witness to facts, you have come to the conclusion that a woman has allowed herself to be talked into a confused belief by another woman who has a confused mind, and who is not to be trusted. No, dear Charles, you have not. You have, man-like, taken that view first, and then you have thought of me as not quite like all the easy and credulous women whom you have known, and you have come round to the conclusion that your wife would not write as she has done unless she had something to say which was worth your serious attention. I know that you are giving me fair play, dearest—what a word? but I write as fast as I could speak, and I have picked no words at all. You are shocked and grieved, and grieved too, dear one, am I that I cannot throw my arms round you while I am wounding you, as I feel I am doing. But it is the truth, Charles. I am convinced that it is the truth.

Do not think that I have rushed on hastily. When I could no longer blind myself to the conviction that R. had chosen, *for his own reasons*, to retain in his own bosom his knowledge of the terrible truth, I fought against all the repugnance which such a thought calls up in a woman's nature, and I tried with all my might to find excuses for his conduct. The natural thought of course was that he might say he had insufficient evidence, and that it was not for him to act until he had more, and that in the meantime he should defeat his own purpose by causing suspicion that he had discovered anything. That might be a humiliating position for a man—and there are men who would have died sooner than have borne it—but it might be in his stern nature to bear all things until the day of retribution should come. I clung to that view, Charles, I am sure for your sake more than because I could feel that it was right, but *it is not true.* You must take my word for what I must not write, but *it is not true.*

Then, dearest Charles, what becomes of all that follows? If it should be made clear to you that R. was acting this unmanly and treacherous part, if you come to the belief that while he was preaching to Arthur of love, and confidence, and domestic happiness, he was nursing up the materials of vengeance, what is to be said of his conduct as regards Laura? Are we to believe in one single word of his statements? He writes that evidence has been placed in his hands, and upon that evidence Arthur is to give himself up to a misery that will break his heart, and you, dearest, are silent, or only speak to confess that if R. is convinced, hope is over—and then it is our turn to make discoveries, and we learn that let him pretend to have what new proofs he may, he had long before had evidence that should have parted him and Bertha for ever. Can we continue to place any faith—the least faith in a man who has been living and acting what I call treachery, put what worldly name you like upon it? I am certain, as I write these lines, that my husband, as he reads them, will feel that we have been cruelly imposed upon. And for you to know of a wrong, Charles, is to hasten to do justice, and I love you for that and for all the rest.

Again I am interrupted, and Bertha asks, in a querulous voice, whether I am setting down things against her, and wishes that she was dead. Dr. Solmes also has come, and will not speak out upon the case, but sees no alteration for the worse, and wishes that she would sleep. Yet he appears to hesitate as to giving her any strong narcotic. I think that he is puzzled, and yet he is too honest a man to be afraid to say so, and he would desire another opinion if he thought that it would be useful. But if there is no change to-morrow, I will take upon myself to speak plainly.

Your letter was short, but very welcome. I do not ask you to write me long letters, but let me have a line every day—I am breaking off from what I most wanted to say. It is this. Let me beg of you not to be guided by any of the considerations which men think so much of, and, whether you have the sanction of Arthur or not, do you find out Laura, and see her. In one minute from the time you and Laura meet, you will know all. I would give thousands to meet her face to face for one minute. Pray, Charles, my own husband, give way to me in this, and let R. say what he may, or let A. urge that it is not for you to forestal him, do you think of me and my happiness, and go away and see Laura. And write me word that you have done so. Do this, dearest. I have more to say to you than I could get into my letter, but if you will only read carefully what I have scribbled so carelessly, I shall be sure that you understand me. I do not believe that R. is a man who should be called the friend of an honourable man; and if you are inclined to be angry with me for writing so harshly, do not be angry until I have told you all that I have to say.

There will be little rest for me until you return, but I am quite well, and so are the children. You need not be told what they would say, bless them, if they knew that I was writing to papa.

Ever your own,

Beatrice.

In reference to this letter it is only necessary to say that the injunction of Mrs. Hawkesley had been obeyed, by anticipation, through the means of Charles Hawkesley's accidental meeting with Mrs. Lygon in the gardens, and that his reply, in which that interview was described, crossed his wife's letter. Hawkesley's communication need not be given, but it should be said that it was brief, that he had touched very slightly upon anything that had occurred in Paris, but had sought to prepare his wife to be told that there was no hope of the reunion of Laura and her husband.

CHAPTER LXXV.

Mr. Aventayle left the Hotel Mirabeau, and with no great accession of good spirits wandered forth into Paris.

"Those fellows make me d—d melancholy," said the kindly-natured manager, "and while they are all engaged upon business of that infernal kind, I swear I have no heart to go grinning at vaudevilles, as I ought to do. Just like me, always letting other folks' affairs interfere with my own."

Nevertheless he generally managed to attend to his own indifferently well; and it is satisfactory to know that the warm-hearted, open-handed man was a great deal more prosperous than he would allow, even in the confessional set up by the commissioners of income tax.

As he went lounging slowly along with a comprehensive grumble at the universe, he put his hand into his waistcoat pocket, and grumbled once more—this time at a concentrated grievance. He had scratched his hand with a stiff card, which he immediately drew out, and perceived that it was that which M. Wolowski had given him when they separated in front of the café on the Boulevard.

"He must be a snob," said the incensed manager, "to use thick cards like that, when decent Frenchmen carry none much thicker than paper. But he asked me to go and call on him, if we did not see our way to doing any good without him. I see none, and I am rather thrown over

than not by that swell at the bureau. I swear I'll go and talk to the Pole. I suppose I have a right to talk to a Pole if I like. I shall not do any good, I dare say; but it is something to do no harm on an afternoon in Paris."

So Mr. Aventayle made out the obscure house to which the card invited him, was immediately admitted, and found himself in the room where Ernest Adair had been finally discomfited by the production of the original manuscript from which he had copied the play sent to Aventayle. While he waited, a pretty girl came into the room, with apparent unconsciousness that anyone was there.

"I cannot find him, papa Wolowski," she said, innocently, and the next moment was all surprise and apology to the stranger.

Aventayle immediately projected his mind into his theatre, and gazed at Madelon with a thought as to how she would make up, and how well that coquettish costume and neat ancle would look behind the foot-lights. Then he took note of the coquettish costume, and resolved that a young lady who formed part of his company, and who had quite as neat an ancle as Madelon, should appear in that garb, at the earliest opportunity. For Mr. Aventayle seldom lost a chance of catering for the edification of the public.

"I cannot flatter myself with the hope that you came to look for me, Mademoiselle," said the polite manager.

It would not have been flattery, however. For papa Wolowski, always ready to afford his pet any innocent gratification, had told her to go up and look at the celebrated London actor.

Of course she had come to speak to M. Wolowski, who had been there a moment before, and had sent her on a message.

"M. Wolowski is happy to be served by such charming messengers."

"Oh, Monsieur!"

The intellectual conversation was speedily interrupted by the advent of M. Wolowski himself; and Madelon departed, forgetting that she had a message to deliver to him—a point which Mr. Aventayle noticed—and then recollected that he was fifty, which thought did not comfort him so much as his next recollection, that he was a celebrity.

"Are you to be complimented as the real papa of that pretty young person, M. Wolowski, or was the term only one of friendship?"

"I hardly know," said M. Wolowski, quaintly. "But as so distinguished a connoisseur allows that she is pretty, we will give her the benefit of the doubt."

"I wish I had a sketch of her dress—it is charming."

"You shall have one before you leave Paris, if you are good enough to think it worth accepting. A young friend of hers has skill with the pencil, and you will make two persons happy by commanding the sitting."

"He is happy already."

"Thanks, in Madelon's name. And so, Mr. Aventayle, you have done me the favour to accept my invitation to call."

"Well, yes, but really—"

"I am your debtor for that. And I perceive, by your manner, that you hardly know what you have come for, or in what way you would like to avail yourself of my humble services."

"You really say what I meant to say. But since I saw you, I have heard a great many strange things, and I have been told—"

"If I can save you any trouble, I will. I know I can save you a little by informing you that I am aware of all that has passed between you and your friend, and M. ——, at the bureau, and of a good deal more."

"Then you know of an appointment that has been made for to-morrow?"

"For M. Ernest Adair to meet other parties, and disclose certain secrets?"

"Yes, you are evidently in M. ——'s confidence."

"I might have heard of the appointment from other sources, but to be frank with you, I have the honour you mention."

"Well, M. Adair is your friend, and therefore I do not expect that you will tell me anything that he would not wish you to tell."

"That, my dear Mr. Aventayle, is the most charmingly original view of friendship. I have been unlucky enough to find that it is one's friends who are always the most ready with objectionable revelations about one, things that one's enemies would never have been able to pick up without such affectionate assistance."

"True enough," grumbled the manager. "But as you are his agent and so on, I speak to you as acting in his interest. I have no finesse about me, and I must go straight to the point, or stop at home."

"No reticence, eh?" laughed the Pole.

The manager looked at him with a humorous expression.

"Oh, if you were not under the table, you know all about it," he said. "Yes, I hate reticence, though I don't know exactly what it is. I dare say that I am showing none, and I want to show none. I wish to say to you, in the first place, that I do not believe your friend, M. Ernest Adair, will reveal any secrets at that meeting to morrow."

"Nor do I," replied the Pole, calmly.

"There then," said Mr. Aventayle, angrily. "Just as I supposed. Then we are all to be made fools of once more, and M. —— was merely humbugging."

"No one can accuse you of not making yourself understood, my dear Mr. Aventayle," said Wolowski, smiling. "But you jump to conclusions with an agility that does honour to your mental muscles."

"I did not know I had any. However, muscles or cockles, we are to be done again."

"Let us accuse nobody unjustly. I think that it is more than probable that my friend, M. Adair, may have to be absent from the meeting to-morrow, and of course, if he cannot attend, he can make no revelation."

"But he ought to be present."

"I think that if he should attend, and should reveal any of the secrets which will then be in his

possession, he will be about the most unwelcome guest that ever joined a party."

"What do you mean, M. Wolowski?"

"As a theatrical artist, Mr. Aventayle, it may have fallen to your lot to play *Don Giovanni*, and to invite the statue to supper."

"No, but I have often played *Leporello*. But what has that to do with it?"

"*Leporello's* experiences will equally serve to explain my meaning. When the statue of the dead man comes into the room, what did you do as *Leporello?*"

"I got under the table, of course, enacting the awfullest funk in the world."

"Well, I think," said the Pole, with the most imperturbable calmness, "that to-morrow, in the event of M. Ernest Adair appearing at the meeting, your friends will have the opportunity of comparing the real and the artistic expression of terror."

"What the devil do you mean?"

"I think that M. Adair will be killed to-night."

"Killed!"

"I think so. I have very good reason to think so. And in that case, I suppose that you will not be so happy to see him at one to-morrow."

"Good God, man!" exclaimed Aventayle, "don't talk of murder in that cold-blooded way! —bah!—you are playing a bit of farce, and, like an old actor, I am sure to be taken in. It is a bad compliment to you, though," he added, "that I was serious for an instant, but I have heard such a quantity of extraordinary things, that I can't feel quite regularly, and as one ought to do. Killed! Not bad."

"At any risk of shocking or paining you," said the Pole, with gravity, "I must prevent you from treating the subject in a way which you would regret. I spoke in all seriousness."

"What are you telling me?"

"M. Adair has gone upon a mission, in connection with the appointment of to-morrow, and it is almost impossible that he should return alive."

"But this is horrible," said Aventayle, starting up. "Who sent him, where is he gone, why is he not protected?"

"He goes of his own free will."

"But—but—what is the sort of danger?"

"You chose to give it a name just now, and, looking at it in an English point of view, I do not know that the name does not suit. We give it a milder name in France. You called it murder."

"And you sit there, and say this as if you were speaking of a trifle!"

"No good purpose would be served by my exciting myself, Mr. Aventayle. I have nothing to do with the business, or the result. I have tried to serve M. Adair, at very considerable loss of reputation to myself, but he will not let himself be served on my terms. He has now chosen, with a kind of dogged impulsiveness, to execute an errand which might have been safely performed by any other person, but which was probable death to him. Circumstances now enable me to say that it is all but certain death to him. He has chosen to throw himself into the power of the deadliest enemy he has in the world, and it happens that the enemy knows the fact. I do not expect to see M. Adair again, unless, as very intimate with him, I should be judicially invited to identify his body."

"I cannot talk to you, you make my blood run cold," said Aventayle, looking very white, and glancing at the door. "Yet tell me. You mean that this poor wretch has gone to meet Mr. Urquhart?"

"His errand was to Mr. Urquhart's house, and there Mr. Urquhart will find him. More probably has now found him. Do you know the man?"

"Scarcely."

"He is a giant, in whose hands Adair will be like a child; and he is a giant maddened by a sense of the worst wrong."

"And *we* have sent the unfortunate creature on this fearful errand," said Aventayle.

"No," said Wolowski; "I was prepared to hear you say that. If you consider it a crime to have placed a bad man in the way of punishment, you are acquitted. It was proposed to him that he should give up his secret, and trust to the honour of those who would have acted fairly by him. But he refused to do so, supposing that he should be able to make better terms with the Englishmen than with the bureau. It is his own avarice that has killed him."

"Is it too late to stop him? Surely something can be done?" said the agitated manager. "It is downright wicked to sit here and speak of a poor wretch being killed. I will do something, at all events."

"I assure you that it is too late," said the Pole. "Whatever was to be done has been done long ere this. Go to Versailles as fast as steam can carry you, but it will be idle."

"I will try, though," said Aventayle, with an oath which it may be hoped is not set down against him. "I am in some sort a party to this wickedness, and it shall not be on my conscience." And he dashed from the apartment.

"A theatrical manager with a conscience!" said the Pole, thoughtfully, as he rose to close the door which Aventayle had left open. "What new *lusus naturæ* may we look for? They will hurry off to Versailles," he added, "he and the others, and they will be too late. There was no help for it. Adair had finally taken the bit between his teeth, and there was nothing to do but to let him dash himself against the next wall. As for his secret, doubtless M. —— has taken care of that, and will be some ten thousand francs the richer thereby. Poor Adair! It is a pity that he had not more self-command, and less greediness. I always cautioned him against gambling, at which he was ever being ruined, and I hoped that he was cured. Now he gambles again upon a frightful scale, and against players who are ten times stronger than he is, and he is utterly lost. I am sorry for him—really sorry. Chantal has far more steadiness, but not his genius. *Ite, missa est.*"

CHAPTER LXXVI.

But Hawkesley was not at the hotel when Aventayle once more hastened thither. Mr. Lygon was there; but upon him the manager felt an almost insuperable objection to break, for their acquaintance was slight, and the character of the communication which Aventayle had to make

was one which made the subject especially unapproachable. Yet, what was to be done? While the manager hesitated, Lygon, hearing a footstep in his brother-in-law's room, opened his own door.

"I thought that Charles had returned," said Arthur, retiring.

"A moment, Mr. Lygon, if you please. I had hoped to find him here; but I have missed him. You have no idea where he is to be found?"

"Not much. He just mentioned Versailles, but I can hardly say that I think he is gone there."

"Versailles! Let me say one word to you."

"By all means, Mr. Aventayle," said Arthur, closing the door.

"I scarcely know how to begin, Mr. Lygon; and yet minutes may be precious. I had better say at once, without stopping to apologise for knowing anything that concerns yourself, or any one else, that I have just learned that a frightful meeting is likely to take place—may have taken place already—and that murder may be the issue."

"Some one we care about, or you would not be so agitated. Who is it, who?"

"Mr. Urquhart has gone down to Versailles to meet Ernest Adair."

"Stop," said Arthur Lygon, his eyes flashing, but his voice subdued by a painful effort until it was almost calmer than ordinary. "How do you know this?"

"From a man who cannot be mistaken—who knows all—who speaks of Ernest Adair as a dead man."

"As a dead man," repeated Arthur Lygon. "That is a strange way to speak of him," he added, very slowly, the words evidently meaning nothing less than what was in the speaker's mind. "So Urquhart has gone down to meet him," he said, after a pause. "You are sure that it is Urquhart?"

"Quite sure. I came to tell Hawkesley."

"It is much more proper that you should tell me," said Arthur, with extraordinary calmness.

"More proper?"

"Certainly, and I am obliged to you for doing so. I wonder whether Hawkesley was aware of this, and whether that knowledge took him to Versailles?"

"No, he could not be."

"You speak positively. I dare say that you are right. However, if he has gone there, it is all very well. He will let me know what is to be done next."

"I fear that I have not made you understand me."

"Perfectly. Urquhart is gone to Versailles to meet Adair."

"To kill him, sir. He will kill him."

"He has a right to do so," replied Arthur Lygon, calmly as before. "At least, for reasons which we need not enter upon, he has the first right to make the attempt. If he foregoes that right, or fails, it will then be a question as to any subsequent step. But Hawkesley will inform me as to that. I am very much obliged to you, Mr. Aventayle."

And with a courteous gesture, Lygon left the room.

"That man is stunned," said Aventayle. "He is not responsible for his actions. I do not think that Charles Hawkesley ought to leave him alone. But, in the name of Heaven, what had I better do? I wish I had not called upon that accursed Pole, and then I should not have been burdened with the knowledge of this horror. I can do nothing. I could tear down to Versailles, and to what end? I might do actual harm. It might be said that I had some knowledge of the deed that was to be done—the police will accuse a man of anything, and that Pole is in league with them."

And the manager, to do him justice, more agitated at the news he had heard, than disturbed at the possibility of his getting into difficulty, sat down and meditated on the extraordinary position in which he had been placed. And in the mean time others were as excited as himself, and with even more cause.

A few moments after Adair had finished transcribing the contents of the *affiche* in front of the house in the avenue, a ceremony which he performed with some ostentation, even returning as if to verify what he had written down, Mary Henderson, emerging from a back street in the neighbourhood, hurried away from the town, and made for a point in the road near the spot where Silvain had met Ernest.

She waited some time, expecting the arrival of her lover, and evinced some of her characteristic impatience. She walked up and down rapidly, and cast eager glances up and down the approaches.

"It is done, though," she said, by way of calming herself. "Only when one has done anything, it is so aggravating to be kept waiting by the person to whom one burns to tell it. Ah, here he comes, and at what a pace, poor fellow. I will not say a severe word to him."

Silvain was certainly coming—coming, too, with all the speed he could put on. No lover ever hurried at that rate to any love-making since the world began. Even Henderson, with all her knowledge of Silvain's devotion, not to speak of his awe, could not attribute that excess of zeal to his mere desire not to keep her waiting.

"You have news!" she cried, the instant he came within hearing.

"News indeed," answered the panting Silvain.

And in half a dozen hurried words he told her that Adair was in the house, and that Mr. Urquhart had followed him.

"I knew it would be so, I knew it would be so. *I saw him* for a moment, Silvain. I knew that he was come for vengeance. It is too dreadful. I must tell the poor lady—I must tell her—I have lost my head—I must tell her."

Mrs. Lygon had been reading, in her chamber, but her heart was far away from the book, which had fallen from her hand. She was far away in England, and a child was at her knee, and the soft cheek of another child, a younger one, rested against her own, and she heard its murmur of affection, an inarticulate utterance to all the world, and more eloquent than any words to one heart.

In a moment Laura was brought back to the realities of her position.

The door suddenly opened, and Henderson, without a word of apology, rushed to the side of Laura.

"The vengeance has come!—it has come upon him, m'm! It has come now!"

The girl was indeed terrified, and it was with difficulty that she could bring out the words.

Terror is contagious, and Mrs. Lygon clutched at the arm of Henderson, and faintly demanded her meaning.

"They are in the empty house together, Mrs. Lygon!—there will be murder, if it has not been done already!"

"Who?—who are, girl?—speak."

"Adair, m'm, and Mr. Urquhart has rushed in to him. There will be murder now, if ever in this world!"

(To be continued.)

AMERICA MILITANT.

BY FRANCIS MORTON.

PART II.

After crossing the Red River at the little village of Preston, twenty-five miles south of the fort—at which point the settlements finally ceased, and a quasi-civilisation was succeeded by utter barbarism—the route of the expedition took a south-west direction over a vast undulating plain covered with a rank herbage of coarse stubble-like grass, interspersed with mimosas and various brilliant but scentless flowers peculiar to the prairies. In the occasional hollows, which had uniformly a southern determination towards the Trinity River, thickets of vines heavy with grapes, wild-plum, and cotton-trees, fringed the beds of trivial streams, generally dried up by the fierce heat of summer, or existent only in pools, stagnant or trampled into loathsome mire by preceding detachments. Two remarkable tracts, twenty miles wide, but extending hundreds of miles in a meridional direction, were successively traversed. These, which are known to trappers, hunters, and frontier-folk, as the Cross-Timbers, being characterised by a singular regularity of outline, have originated a theory that, at some remote period, they were planted by the hand of man. Beyond, the country rose continuously, its monotonous aspect being varied toward the Brazos River by occasional copses of stunted oaks and thickets of the musquit, a thorny acacia, perhaps identical with that which yields the arabic gum of commerce. The only visible dwellers in the wilderness were a few shy grouse, or prairie-fowl, and wary deer, that foiled all the craft of the inexperienced hunter; innumerable rattlesnakes, whose friendliness to man was evinced by a disagreeable habit of insinuating themselves into the folds of the blanket in which he slumbered and by clustering around his watch-fire; and legions of famished prairie-wolves that, though absolutely undiscoverable by day, rushed forth at dark from mysterious retreats to prowl around the camp, and startle the weary traveller with fiendish cries.

The transit of this inhospitable region was effected with as much consideration for the convenience of the soldiery as was consistent with military discipline, and with that discreet caution suggested by the undoubted proximity of savage enemies. For various incidents apparently trivial—smouldering embers, an incautious footstep, a discarded moccassin, the morning dew brushed from the grass—assumed a strange significance to experienced eyes, as indicative of continuous observation by vigilant and ubiquitous foes, eager to profit by any inadvertence or intermission of watchfulness, but far too wary rashly to expose themselves to the grape and canister wherewith the brass howitzers were prudentially loaded.

Réveillée beat ordinarily at three, ere yet the stars had paled. Within five minutes after that, the soldiers thus abruptly startled from repose had assumed their attire, buckled on their accoutrements, and stacked arms by companies between the lines of tents in the temporary encampment. Ten minutes later, the knapsacks had been packed and the tents rolled up. A quarter of an hour sufficed to arrange these and the scanty baggage of the officers in the waggons of the respective companies. This having been effected, the force sat down on the dewy grass, and, by the light of a few candle-ends stuck here and there amid the wild-flowers, drank their hot coffee and ate their biscuit in moody or sleepy silence. Meanwhile, amid a tempest of whip-crackings and polyglot vituperation of refractory mules, the loaded waggons successively passed away from the careless eyes of the reclining soldiery into the vague obscurity of the prairie, over which the train extended in a continuous line two miles in length. Then, faint streaks of grey on the horizon heralding the advancing dawn, the drums beat the Assembly, the companies fell in, assumed their arms, and, marching in succession by the flank, pressed onward in a dark column to take the advance of the expectant train, leaving beside the expiring watchfires of the abandoned camp empty whiskey-bottles and greasy playing-cards strayed from their packs as indices of the advance of civilisation.

The brisk motion quickening their blood, the cool morning air exhilarating their sense, and the advent of daylight imparting confidence to their steps, the soldiers soon shook off the languor which had oppressed them at starting, and, dismissing from their thoughts all other anxieties but that as to the character of the next evening's camp, lighted their short pipes, and, cheered by the fragrant fumes and interested by the rapid changes of scene consequent upon their advance, jogged easily on, whiling away the hours as they best might with uncouth jests and naïve speculations on what was strange around them. But in this, as in the journey of life, those most gay and confident at morn become grave and sad enough ere even. Those seemingly best qualified for effort evinced in general least endurance; for not thews and sinews, but constancy and tenacity of purpose, render man truly strong. Hour succeeded hour, and when the sun was in the zenith, and the canteens were exhausted one by one, the weaker and less resolute strayed from the ranks amid the jeers of their firmer comrades, and either limped dejectedly after the column, or, intentionally lingering in the rear until overtaken by the advancing train, crawled furtively into the waggon of some friendly teamster, soon, however, to be ignominiously ejected by inflexible authorities; for none were allowed the privilege of entering the train but the sick and the cooks of companies

whose culinary avocations occupy most of the night. On reaching a stream the column was invariably halted a few minutes that the canteens might be refilled; but streams were rare, and sometimes, rendered half delirious by heat and thirst, the men drank greedily from

Gilded puddles which beasts might cough at.

Excepting on such occasions, the column steadily pursued its march at an even pace until it arrived at a spot, adapted by the possession of wood and water for an encampment; the length of the day's march depending entirely on this. When the existence of these conditions was satisfactorily ascertained, the line halted, broke into columns of companies, and stacked arms. On the arrival of the baggage-waggons, which were always in the van of the train, the tents were pitched in ranges parallel to and between these lines of arms. After providing the cooks with wood and water, the weary men reposed while awaiting dinner, with the exception of those unhappy ones who had been selected for guard, and were destined, notwithstanding their fatigue, to be on duty and awake most of the coming night. Dinner was usually ready about four, when the rear-guard was coming with the slower waggons into camp. Guard-mount and doctor's-call then rapidly succeeded; tattoo was beaten invariably at eight, that the men might retire early to slumber; and, five minutes later, all lights within the tents were extinguished, and all noise or talking that might have interfered with the general repose strictly prohibited. Nevertheless, after a short nap, certain dissipated fellows would assemble, according to previous appointment, among the further waggons; and there, screened from observation, and indifferent to the plunging and kicking of the vicious mules around them, would carouse and gamble until early réveillée abruptly terminated their enjoyment, and recalled them, haggard, heavy-eyed, and jaded, to the duties of another day.

A fortnight thus elapsed, and finally, without having encountered other annoyances than those arising from the heat of the season and the general deficiency of water, the goal was attained, and the regiment was reunited towards the end of August on the left bank of the Brazos.

The two main branches of that great river, at this point a hundred miles apart, are termed the Clear and Red Forks of Brazos respectively; the waters of the first being sweet and pellucid, but those of the second, whereon the camp stood, and of all its affluents, being turbid and nauseously saline. The only spring as yet discovered in the vicinity was several miles distant, and the supply it afforded was so scanty and precarious that it was necessary to put the force on allowance.

After some days' suffering on this account, it was considered advisable to divide the command; and the left wing of the regiment in consequence took a new position to the west on the Clear Fork, leaving the right wing to waste the autumn in excavating useless wells on the elevated plains, where water could not possibly have existed. The prairie here terminated abruptly in bold bluffs, leaving a fertile flat at their base, from 1000 to 5000 feet in width. Through this flat flowed the Brazos, with an average width of 500 or 600 feet, alternately approximating and receding from the cliffs which restrained its course, and though generally shallow, subject to such capricious variations of level, that the adventurer who had found it but knee-deep in crossing two or three hours before, might discover to his dismay that return was intercepted by a furious torrent. Gradually, exploring parties ascertained the existence of a large pine forest at a distance of forty miles; the scrub-oaks of the vicinity were found to furnish timber of better quality than had been anticipated; gypsum, lime, and stone admirably adapted for building were plentiful; the plain was strewn in one direction with immense boulders of almost virgin iron; excellent coal cropped out from the cliffs on either side of the river; and from these coal measures fresh water flowed out in tiny rills so abundantly that only cisterns at the base of the cliffs were lacking to secure as ample a supply as could possibly be required. Thus, ere the Indian summer, or last days of autumn, had passed away, every one was satisfied that the region was by no means so bad as had at first been conceived.

Terrific thunderstorms, accompanied by the first rain that had been known in that country for years, preceded an exceptionally rigorous winter. Snow lay heavy on the ground for a month, during which the troops, intermitting their labours in dismay, gazed mournfully from their tents at the inclement skies and whitened ground, uncheered by grog, while masticating their lenten fare sighing after the fleshpots of Egypt,—"the cucumbers, the melons, the leeks, and the onions,"—and bitterly exclaiming that they had been led out into the wilderness to die!

Then became apparent the excellence of the organisation of the American army. The thoughts of the despondent soldiery were withdrawn from contemplation of inconveniences unavoidably incidental to an exceptional position to those active exertions whereby it might be improved. An area 1000 feet square was cleared of brush on an eligible slope, sheltered from the wintry northern blasts by a dense coppice, for the purpose of erecting temporary quarters. The position of the designed buildings being then marked out thereon according to the usual quadrangular arrangement, and trenches two feet deep cut on the lines of walls, the scrub-oaks of the adjacent prairies were felled by hundreds, and cut into twenty-feet pickets, which, being planted in the trenches side by side, and connected above by battens and cross-ties, the excavated earth was then filled in, and trodden down, so as to retain them in position. These palisades were then chinked and daubed with clay, so as to form walls impervious to the weather; rough stone chimneys were built at either end of each tenement; rude doors were made and hung; and the older tents, now to be discarded, were formed into coverings, which, after being extended over the roof-trees, were drawn down tight, and securely fastened at the eaves. Within those buildings to be occupied as barracks double tiers of berths were erected along the walls, formed of packing cases and such other impromptu material as could be furnished by the quarter-

master, imparting to the interior somewhat the semblance of an emigrant-vessel's steerage; while floors having been formed of tempered clay well beaten down, the rude aspect of these domiciles was amply compensated by the reality of comfort.

Within seven weeks the quadrangle was completed in this style, including quarters for five companies, or 400 men,—guard-house, magazine, quarter-master's and adjutant's offices, and officers' quarters; and, without the quadrangle, a hospital, and a commissariat-store, 400 feet by 40 feet, to protect the public property. The succeeding fortnight was devoted to erecting, further down the slope, a stable capable of sheltering 250 horses and mules,—hitherto picketted on the prairie, and exposed to savage greed and ingenuity,—forming one side of a yard elsewhere enclosed by a line of pickets. Such was the willingness of the men, and the judgment wherewith their labours were directed by the officers, that about Christmas the object of such strenuous exertion was attained in the completion of Fort Belknap, as the post was named in honour of the gallant lieutenant-colonel of the corps, then unhappily expiring at the post, of disease contracted during arduous services; and the force was now almost as comfortable, and the usual military duties were as punctiliously observed, as though the scene had been New York.

Towards the close of winter the continued use of salt provisions generated scurvy, and carried off two or three whose constitution had been weakened by previous years of reckless dissipation; but the issue of fresh meat on the arrival of herds of commissariat cattle from the frontier, and the establishment of a public bakery, quickly re-established the conditions of health. Here it may be necessary to observe that the American army ration being of flour and not of bread, biscuit being issued in its stead only under exceptional circumstances, and as the greatest inconvenience and discontent would ensue were its formation into bread to devolve on the individual soldier —a special arrangement is made to effect it. The flour, drawn from the commissariat every ten days by the respective companies, being delivered at the fort bakery, an equivalent *weight* of bread is issued, as it is required, day by day, at the rate of $1\frac{1}{4}$ lb. per ration. But the difference between the respective weights of flour and the bread made therefrom is such, that an approximate saving of one-fifth of the flour is effected to the benefit of the establishment, which sells the flour gained by the operation in the form of bread to the officers and their families, to those hungry soldiers whom their ration does not satiate, and lastly to civilians of the vicinity, at the rate of 2*d.* per ration to the enlisted man, and of 4*d.* to all others. The bread is almost invariably excellent, and in every way preferable to that sold by professional bakers on the frontiers. The funds thence accruing,—which vary with circumstances, such as the locality, strength of the garrison, populousness of the vicinity, &c.,—after deducting the expenses, including the extra pay of the bakers (who are invariably soldiers specially selected for the duty), are partly expended on the Post library, and partly on the regimental band, whereto the State contributes only by authorising the enlistment of a certain number of musicians as privates, whose extra pay, music, instruments, &c., must be provided for by the corps. Similar economies may be and are effected by companies on their other rations, the commissariat being always ready to commute undrawn rations for money; and this fund is employed by companies, under the supervision of their immediate commanders, in extending the company library, in purchasing garden seeds, liquor for festive occasions, and other little comforts. The rations furnished by the State are so liberal, that with ordinary economy the funds of a company or regiment may be very large.

At this time a few Indians ventured occasionally to enter the post, carrying as a pretext for their presence a quarter of venison, or a couple of wild turkeys on the pommel of their saddles. These first visitors, being always kindly received, protected from insult, and furnished according to custom with a few rations, after satisfying their secret curiosity and apprehension, must, on returning to their dusky brethren of the wilderness, have spoken most eulogistically of what they had seen; for, henceforward, whatever of interest might be going on *coram publico*, a few slouching Indians were always among the spectators; and whatever scanty game the prairie afforded the troops were provided with by these vagrant gentry.

The only occurrence which in any respect disquieted the force during its stay at Brazos took place during this first winter, on one tempestuous night of which an entrance was effected into the *corral*, or stable-yard, by the removal of a ricketty picket; when about fifty horses and mules loose in the enclosure were abstracted so dexterously that, owing to the war of the elements, the loss was not discovered till the sentries were relieved an hour afterwards. The alarm being then given, the long-roll beat tumultuously, and the troops were immediately got under arms in anticipation of a possible onslaught of savages. At dawn an efficient party was organised and equipped, which, mounting in fiery haste, eager for a fray, departed in pursuit under the direction of a guide versed in all Indian wiles. But, after following the trail northward for 300 miles, as far as the Canadian river, without encountering the thievish fugitives, or other result than the recovery of a lame mule abandoned by them in their flight, the exhaustion of both horses and riders, and the lack of provisions, enforced the soldiers to return. Suspicion fell at first upon the poor Ishmaelites prowling round the post, and for some time the soldiery looked somewhat askant at them. Circumstances however subsequently exonerated them, and fixed the guilt on a band of unscrupulous knaves from the settlements. Certain disreputable villains of this description frequently on the frontier disguise themselves as Indians, for the purpose of committing the most atrocious outrages on their own people, in comparative security, and these crimes are hastily attributed to the poor children of the desert, who are far less deserving of the name of savages.

With spring arrived the long expected colonel,

with those reinforcements for the regiment annually dispatched at that season from the recruiting depôt; and the presence of this dignitary was the signal for renewed activity, whereof the object was the erection of more permanent and commodious quarters. Here it is requisite to apprise the non-professional reader that the efficiency of troops depending as much on that of their commissariat and quarter-master's departments as upon the bravery or discipline of the men, it is primarily necessary that they should be clothed, fed, and housed, and that there should be distinct organisations to effect those ends. Not only in every regiment, but in every detachment of the United States' Army, officers are detailed for these special purposes, with a staff of subordinates selected from the ranks, and directly responsible to the head-quarters of their respective departments. The commissary receives from thence and issues to the troops clothing and subsistence stores. The quarter-master similarly provides, by indents on the quarter-master general, or in certain cases by private contract with civilians on behalf of government, means of transportation and tents, with all the variety of implements and materials required in the erection or repair of buildings used for military purposes. When their services can be made available all the employés in these departments are soldiers; and a considerable proportion of the enlisted men are thus continuously engaged as clerks, mechanics, and teamsters; receiving for their services a liberal consideration, which is a premium on good conduct and diligence. On this account, at recruiting offices, mechanics are preferred to ordinary labourers, and the first enquiry made of an aspirant to glory is as to his particular craft.

This having been premised, it will be easily understood that, when extensive and permanent works were contemplated, the first preliminary was to ascertain, by reference to the regimental descriptive book, what and how many mechanics were available for the public service; while the next was to assign all masons, bricklayers, plasterers, smiths, sawyers, carpenters, joiners, &c., to extra duty in the quartermaster's department. The remainder of the force was destined for that ruder labour wherein "muscle" is demanded rather than any special intelligence or skill, and which accordingly receives no additional payment.

The force suddenly recovered its wonted activity, rising at réveillée to pursue the daily labours in various directions, and returning at retreat, i. e., sunset, to repose. According to their several qualifications, men were assigned to the offices as clerks or storekeepers; to the yard as drivers or stablemen; and to the workshops as mechanics. A large party, well armed, was permanently detached for the purpose of cutting pine-timber in the distant forests; and other parties were constantly in the coal-pits and stone-quarries of the immediate vicinity. A saw-mill of forty horse-power was erected, the engineer being a soldier, and thereat the lumber daily arriving rapidly assumed the form required by the carpenters and builders. A certain number of veterans was reserved for military duties, furnishing guards for the post and escorts for the trains continually passing to and fro.

When off duty, the leisure of these last was employed in forming staff and company gardens on the fertile flats along the river; and the horticultural labours of these amateurs were so successful that the wild shortly became luxuriant with all the vegetation required for culinary purposes, and their melon, strawberry, and cucumber patches might have challenged comparison with the long-lamented ones of Forts Washita, Smith, Gibson, and Towson. Roads radiated from the fort in various directions over the prairies, and they were easily formed, for it was sufficient that a line of loaded waggons should once pass over the soft ground to leave thereon a clearly defined track. Constant as public labour was, it was never excessive, ample time being allowed for refreshment and repose. It was, in fact, precisely the amount of exercise demanded by health, it was liberally recompensed, and its ultimate object was the personal comfort of those engaged therein. A single afternoon was weekly set apart for battalion-drills, with especial view to the improvement of the younger soldiers.

With this exception, only on Sundays had the place a military aspect. Then, all labour having been thrown aside, the soldiery rose Antæus-like, reinvigorated by contact with mother-earth, and resumed joyously the garb and functions of their proper profession. The customary inspection at morn, and the parade at even, were inflexibly enforced; but, as yet, to the general delight, no chaplain had been appointed by the kind and paternal solicitude of the government; and consequently the intervening hours were devoted to amusement, reading, repose, or cheerful conversation on what had been effected during the previous week, and other little local matters personally affecting the interlocutors, who thought little of the world without their immediate circle.

At the expiration of two years from the exodus, a stranger would have been astonished by that which had been done by so small a force. To the south of the first quadrangle, the buildings of which had now a very ricketty and dilapidated appearance,—though they had been thatched with prairie grass, and occasionally otherwise repaired,—five ranges of company quarters had been erected in order of echellon, each 120 feet in length and 40 feet in width, and with a detached building corresponding to it 40 feet by 30 feet, for a kitchen and mess-room. Parallel to this series of quarters, there had also arisen a granary 150 feet by 40; a commissariat, 120 feet by 40, and three stories high; and a magazine 40 feet square. These were all built of cut sandstone, roofed with shingles in default of slate,—with the exception of the magazine, which had an elliptical stone roof,—and all with numerous well-glazed windows. The quarters were fitted up with that number of massive oaken bedsteads required by the organisation of the company, i. e., 84 in each. On a gentle rise of the ground, commanding these buildings, a line of officers' houses had been built—ten in number—all constructed of wood, six-roomed, plastered within and without, and thatched with prairie-grass, having precisely the appearance, with their

pretty verandahs, of our officers' bungalows in India. Each was surrounded by a large and neatly trimmed garden, forming as pleasant a rural retirement for a gentleman as could be conceived of. A large store had been erected on the plateau in a convenient position by the suttler at his own expense, whereat all the little luxuries, except liquors, that a soldier might require, were obtainable at very moderate cost. The entire slope or plateau whereon these various buildings stood was kept by assiduous mowing and grubbing as smooth and trim as any gentleman's lawn, and the gardens at the base of the cliffs, notwithstanding the depredations of the locusts, were all that could be desired, forming a strange contrast to the wilderness amid which they stood. Availing themselves of the military protection, several settlers, crossing the intervening wilds, had arrived from the adjacent frontier, and squatting in eligible positions without troubling themselves about title-deeds, had built for themselves little log shanties on the verge of the military reserve, cultivated little patches of maize, raised poultry, and drove a thriving business with the garrison in dairy and farm produce.

On the completion of the new quarters, the progress of which had been regarded with great interest, the troops joyously took up their abode therein, abandoning their former dwellings to a slow decay with military insouciance; as few being disposed to remember the happy hours once passed within those now dilapidated walls, as to meditate on the transitoriness of all material things and of the joys dependent thereon, that their decay might have suggested.

The popular transport on attaining a comfort previously unknown to many, and in the pleasing anticipation of indefinite repose, was disagreeably checked by the ominous remarks of the more thoughtful and experienced soldiers.

"Yes, yes," would croak one of these veterans with a grim smile and wise wag of his head, "it's very snug indeed, as you say, Jenkins, or O'Flaherty," as the case might be, "very pleasant indeed, if—it would only last. But that's exactly where it is, d'ye see; our comfort's too great to last long. It's not our luck, by —— That old ass of a colonel of ours is so proud of his work, that, like the foolish hen that must go clucking about to let all the neighbourhood know that she has laid an egg, —he'll be writing in his own praise to Washington, and the Secretary of War will come to the conclusion that Brazos is a great deal too good for the dirty old ——th. Mark these here words, lads, that'll be the end of the matter."

Men very readily turn from the contemplation of a disagreeable future to the enjoyment of the present; and of course the auditors of these sinister prognostications soon recovered from their temporary discomposure, and resolved not to believe in the possibility of what they secretly apprehended. But their confidence was precipitate, for within two months from the first occupation of the new quarters, the contemned predictions were justified by the event. A general order arrived, commanding the immediate advance of the regiment to the Rio Grande, and the occupation of the vacated posts on the Brazos by the very corps which had previously played the part of the cuckoo. *Sic vos, non vobis, nidificatis, aves!*

Though many of these soldiers were recruits, who, having recently joined, had not personally felt the grief of leaving the pleasant posts in Arkansas; yet each man, associating himself with the part of the corps whereto he now belonged, and claiming a share in its glory, felt as if he had been individually wronged in the former instance. It may be imagined with what wrath the regiment again turned its face to the wilderness; certainly, were curses operative, the gentleman then at the head of the War Department has a very unpleasant prospect before him.

The merits, in an economical point of view, of the military system that it has been the object of the writer to describe, can only be distinctly apprehended by ascertaining approximately the expense incurred by the State in the erection of the post in question;—which the reader may be assured is not ideal, but really existent, having very recently been taken possession of by the revolutionary authorities of Texas.

Assuming that on a average 130 men, or a third of the force present, which is an excessive estimate, had been receiving extra pay for two years at the rate of twenty cents daily, or six dollars monthly (about twenty-five shillings), in addition to their military pay proper; the total sum paid to troops for labour would not have exceeded 18,000 dollars. The entertainment at the post of means of transportation,—already, however, existent, and which would have been present there whether there had been work of this description or not,—the cost of forage, artificers' tools, iron and iron ware, and other material, amounted to perhaps as much more. Thus these works cost about 36,000 dollars; or only 7,200*l.* beyond the sum which would necessarily have been expended in supporting in mischievous and unprofitable idleness the troops thus usefully, economically, and even with reference only to themselves, beneficially employed in the public service. Had artificers been engaged from civil life, in addition to the enormous expense of transporting them many hundred miles to the scene of their labours, not one would have accepted less than forty dollars monthly, with his rations, quarters, and liquor. Supposing that only 100 private artificers had been employed, and estimating the rations at ten dollars per mensem, the cost for artificers' labour alone would in a year have been 60,000 dollars, or 12,000*l.* What would have been the cost of similar buildings here, and how incalculably it would have exceeded 7,200*l.* it would be superfluous to say.

The analogy between the military discipline of republican America and republican Rome deserves consideration. The Roman soldiery, in place of being an aggregation of worthless drones, supported in vicious indolence by the laborious industry of their fellow citizens, contributed as much to the commercial prosperity of the Republic by their toil, as to its aggrandisement and renown by their swords. The pioneers of civilisation, the legions, to establish the supremacy of Rome, made roads, erected bridges and aqueducts, built cities,

and diffused a knowledge of the useful arts throughout previously barbaric Europe. The American soldiery are similarly engaged.

From these considerations, the thoughtful reader may naturally be induced to inquire, at this day of immense armaments during profound peace, whether the men thus withdrawn from industrial pursuits, and thus, both directly and indirectly, subtracting from the wealth of the nation, might not most legitimately be expected to contribute in some slight degree by their labour toward the cost of their entertainment? Whether also the health, moral and physical, no less than the efficiency of troops, might not be incalculably advanced thereby?

To any idle assertions to the effect that a soldiery would be demoralised by such toils as have been described in the preceding pages, apart from the undeniable refutation afforded by Roman history, and by the less known American army; it may be replied, that all the great public works in Algeria, the forts, quays, barracks, roads, and bridges, erected within the last thirty years, are due to the genius of the officers and the energy of the men of the army of occupation; and it remains yet to be shown that the French army has in any respect deteriorated in consequence.

BLONDIN.

"Have you seen Blondin?" is a question which the bill-stickers have propounded to the students of mural literature throughout the metropolitan police district, and at every considerable railway station in the kingdom. Well, we have seen Blondin—something of him, that is to say. By the time that these remarks are public property he will, very probably, have performed feats which will put those we saw entirely in the shade. It would not do, you see, to dish up the terrible all at once. The pleasing feat of placing the life of a little child in deadly peril, for example, was in reserve. Horror! For ourselves we desire no second portion. We have seen enough —enough (we are not ashamed to own it) to set our pulses thumping painfully, to send a cold sickening terror crawling along our veins, to make us very glad to look anywhere but at the figure on the rope, when the fascination which rivetted our gaze upon it had a little died away. When this happened, and we looked around, we beheld a more curious spectacle than Blondin will ever present, reflected in the sea of upturned faces that were watching him. Desiring faithfully to represent this performance, we then divided our attention equally between the rope-dancer and his audience, until we could see what was going on above reflected upon the faces below, and observing the performer could tell exactly how each feat was received by the crowd which surrounded us.

From the first, our object had been to observe the *effect* of this sort of amusement. We, therefore, carefully avoided the two first exhibitions which took place upon special half-crown days, knowing that your special half-crown visitor is of the class which habitually conceals its feelings, and educates its countenance to assume, under all circumstances, the expression of a well-to-do caterpillar of inferior intellect. We, therefore, chose a one-shilling day for our visit to the Crystal Palace, and it so happened that it was the seventh anniversary of its opening. Remembering certain sports and pastimes which certain small but lively children had witnessed there, perched upon our shoulders at Christmas time, and reflecting upon what we were going to see; we could not help moralising a little as we rolled along in the train, upon the career of the famous Sydenham Glass House—the great things it was intended to do, and the small ones which necessity had declared should be done by it instead. Poor Albert Smith's prophecy, delivered at a time when the wise of the land had made up their minds that Alhambra courts, Pompeian houses, and models from the Vatican were sufficient attractions to fill the building and enrich its proprietors, came to our remembrance, and lo! we were to be present at its fulfilment to the last particular. There *had* been dancing, there *had* been catch-penny spectacles, there *had* been conjurors and fireworks and clowns—and here was the acrobat! And very natural too. The gentlemen who compose the company are speculators who require interest for their money, not philanthropists who devote it to opening a school for the public which the public would not attend.

It is perhaps indispensable that the language of the circus should be used to announce its peculiar feats, otherwise it would be difficult to explain why M. Blondin is styled the "*Hero* of Niagara," and his transit from one end of a level rope to the other over the boarded transept of the Crystal Palace be announced as a "great cataract ascension!" Arrangements are now being made for him to perform upon a rope stretched over the fountains in the garden which are to play upon and around him; of course with an object of giving the untravelled British public the best possible idea of the Falls of Niagara!

The rope upon which M. Blondin performs at present is two inches in diameter, and 240 yards long. This is stretched from the level of the hand-rail of the highest gallery in the transept, right across to the other side, and kept from swinging laterally by fifteen pairs of guy-lines, each line having one end secured to the sides of the roof, and the other passing through pulleys attached to the rope and weighted with heavy lumps of lead. The hawser is thus made steady without being rigid, at a height of 170 feet from the ground, and M. Blondin disports himself upon it as though it were as broad and safe as the pavement of Waterloo Place. He walks along it, dances along it, runs along it, throws (what is called but which is not) a somersault upon it, stands upon his head upon it, traverses it blindfold, enveloped in a sack, trots merrily along it with his feet fastened in waste paper baskets, takes a cooking stove upon his back, and having fastened that in the centre of it, cooks an omelette there, which the spectators may eat if they please. The ease and apparent certainty with which all this is done takes off something of the terror which the performer's situation inspires; but quite enough is left to make the spectacle a most painful and, to many minds, revolting one.

It cannot be pretended that M. Blondin's movements are graceful. There is nothing novel or elegant in the performance from beginning to end. We have seen equally good rope-dancing at a country fair, and as for the gymnastic feats they could be surpassed by the pupils of many a gymnasium in London.

As rope-dancing and gymnastics they gain nothing in quality from being performed at so great a height, and if they pass as wonderful because they are done under circumstances which should make the performer lose his head, the same interest would be produced if he were to drink two bottles of champagne, and then attempt them on the ground. If the rope were stretched at a height of only ten feet, so that a fall from it would not signify, or if—placed as it is—a net were suspended beneath it to secure M. Blondin against a fatal accident, his performance would instantly cease to attract. Danger and nothing else is its charm. Abstract this, and nothing remains that any one would care to go a hundred yards to see. The more apparently dangerous the exhibition is made, the greater its attraction. So, mere walking and posturing upon the rope having become vapid, the sack and the wicker baskets are brought out, and M. Blondin pretends to slip, that the spectators may not become hardened into the belief that his skill is all-sufficient to sustain him, and that there is no chance of their beholding a mangled crimson mass writhing in the midst of that ghastly space which is kept clear 170 feet below.

It was when M. Blondin—blindfold and enveloped in a sack—pretended to slip, that we turned away our eyes and saw his audience. Just then, the sun streamed through the glass roof, lighting up thousands of upturned faces, and revealing to us that we were not the only persons who could not brave the sight. Two ladies in our immediate vicinity fainted. Several others had their faces in their hands, and many a strong man averted his gaze from the sight. Upon the countenances of those who endured, and watched it, many feelings were expressed. There was pity, and terror, and suspense, and admiration, and horror, but not one particle of pleasure. There were dilated eyes, quivering lips, clenched hands, loudly beating hearts,—but not one smile until the performer passed from that dreadful line to the firm floor, and then followed a gasp of relief. We write of what passed around us, and what we saw, looking down from a corner of the great orchestra with a good glass as far as we could see. There was one—and only one—person who appeared to enjoy what he saw. He was dressed like a farm labourer of the better sort, and sat in a front row with his mouth upon the broad grin, and his eyes running over with delight. How he banged his great red hands together after each feat! How he rolled about and stamped with glee!

An hour afterwards we saw him again in the refreshment room, and thought he was drunk, but were undeceived by a policeman, who informed us that he was quite harmless—merely idiotic from his birth, nothing more. We can safely say that no one looked as though he *enjoyed* the sight, and that the applause which followed a clever solo upon the cornopean in an interval of rest was as hearty as any that Blondin received after his most dangerous feats.

We are afraid that the "hero of Niagara" is not a good sign of the times. Do we blame him for giving these entertainments? Not we! He can make one hundred pounds a day by them, and as that is the price at which he estimates his own neck, he is entitled to risk it as often as he pleases. Do we blame the managers of the Crystal Palace for engaging M. Blondin? Not we! *He draws*—at present, and his performance is not more vulgar or inconsistent with the place than many which have preceded it. Do we blame the British public for tolerating such exhibitions, and rendering it possible that they can be profitable? Most assuredly we do! It is a sign of the worst possible taste, of a craving for excitement of the worst possible order, or of a blind and servile obedience to fashion.

Blondin is fashionable! It is "the thing" to see persons in deadly peril of their lives. Perhaps there is some one who attends every one of these performances, so that he may not be absent when the crash comes, just as the old gentleman followed the Lion Queen all over the country in hopes of seeing her head bitten off by the lion into whose mouth she placed it for the amusement (?) of the public. We are told to have no fears for Blondin, that he has practised catching the rope in case of a stumble, and that he is sure to save himself. Of course! Everything and everybody is quite safe until—. That poor Lion Queen was quite safe, but the old gentleman had his wish. Scott, the American diver, was quite safe. He went through the merry performance of being hanged on Waterloo Bridge. How well he did it, how he writhed and jerked! Bravo, Scott! Why does he not get down and bow his thanks to an admiring audience? There is a little mistake—he has hanged himself in earnest, he is dead! The poor wretch who is now a helpless cripple living in an iron cage to support his broken back, but who only a few weeks ago delighted the votaries of the Alhambra in Leicester Square with his daring feats on the flying trapeze, was quite safe. Bless your heart, he had practised the thing till he *could* not fail!—only somehow or other he *did* fail. The public in its stupid craze for perilous amusements has led these and scores of others to their deaths, or to accidents which make life one long fit of pain. We wish M. Blondin no sort of harm; but if his audiences were to dwindle down to nothing, so as to cause him to retire upon his savings, we should congratulate him upon having escaped a great danger, and the country upon getting rid of a disgrace to the intelligence of the age.

June 15. Albany Fonblanque, Jun.

JESSIE CAMERON'S BAIRN.

A TALE IN TWO CHAPTERS.

CHAPTER I.

In a little secluded weaving village in the Lowlands of Scotland, far away from city influences, good and bad, lived the heroine of this true story;—an innocent young Scotch lassie, and a thrifty, with the natural roses of some nineteen

summers blushing on her healthy cheeks. To quit the good old style of hyperbolical story-writing, she was a fair specimen of the unsophisticated village girl,—if anything, a shade more shrewd and womanly than most girls of her age and position. Healthily handsome, and with all the promise of a good substantial housewife, she did not fail to obtain some few suitors,—whose cannie Scotch heads were not, however, turned by her good looks. They made love to her as ordinary people eat bread and butter, making no fuss about it; but liking her as hard-working young men like hard-working young women who bid fair to become useful helpmates. Their love, if I may call it by that name, was hard matter-of-fact stuff, and they made no faces when they swallowed it without sugar; it was a sort of strengthening medicine which they were obliged to earn and pay for.

Jessie Cameron was the name of this good-looking young woman. She lived with her step-mother in one of those little thatched cottages of which so many sweet Auburns in England, Scotland, and Ireland are composed. Not a rich girl, but one who worked hard for her living. Her business in the house was to make the oatcake, milk the cow, and turn her handy fingers to household work in general. But over and above all this, she laboured at the loom. As I have observed, she fulfilled her duties with a sufficiency which gained her a good character among the marriageable young men of the neighbourhood. Mrs. Cameron, her stepmother, was a woman of rather less than thirty years of age, still handsome, and almost certain to marry again. She had married Jessie's father, who had since died, when Jessie was a little girl of twelve; she had no children of her own. Her beauty—though that is far too strong a word for the fact—was of a very different order from that of her step-daughter. While the latter was dark and tawny, Mrs. Cameron was fair-haired, sanguine-complexioned, and blue-eyed. But there was a black dreamy look in the blue eyes, and a heavy coarseness about the full red lips, which indicated a listless, morbid nature, tempered and heightened by an underlying sensuality. Still, in her own way, she was a busy bustling woman enough, and was respected and rather liked by her neighbours. Her blood was Scottish, though mingled with the blood of an Irishman, her grandfather. She had a sort of reputation for piety, being, like most of the people in those parts, a rigid member of the Free Kirk.

Opposite to the small cottage where these two women lived alone, stood the smithy, where the old blacksmith had laboured with his boy for years; a cheery, weather-beaten place, where cheery weather-beaten cronies met to have their daily cracks.

A change came over Jessie Cameron's monotonous life. One fine summer day the smithy was closed to the cronies, and news soon circulated through the village that old Aleck Mackay the blacksmith had given up the ghost. The affair passed over without comment save from garrulous old women. But by and by came word that a new hand was soon to handle the big hammer and blow the big bellows in Aleck's stead. John Macintyre (familiarly called Jock), a young fellow from a neighbouring village, was to be the new occupant. Jock sent a good name before him; he had the reputation of being a "weel-to-do-callan." So the lassies began to brush up their best looks, in the hope of attracting his attention some Sunday, as they tripped toward their seats in the little church.

In course of time the new hand came, and the forge again flamed from morning to night opposite Mrs. Cameron's cottage door. A fine young fellow, who stood some six feet high in his shoes, was seen toiling at the bellows, and flourishing the heavy hammer. A fair and honest Scotch face had Jock, and a strong arm, and a roguish eye; no wonder the girls began to set their caps at him. But Jessie Cameron had work to do, and found little time to gaze at the young fellow over the way. However, Jock the blacksmith was there, watching her with tender thoughts in his heart; for he was soft-hearted, and liked the girl's face passing well.

This was how they first began to fraternise,—Jessie and Jock. Hostilities (excuse the expression) began in a nod and a smile from the latter, as he took down his shutters one morning; they were continued by the former, who answered the nod and the smile. The next morning the same mode of salutation was repeated; and so on, for a fortnight or so. At the end of that time the blacksmith was on speaking terms with Jessie and her stepmother. By and by, too, the girl found a corner in her little heart vacant, and Jock was installed there secretly, and with many tender wishes.

Jock had come to the village in early summer. By autumn time—when the haymaking was over and the reapers were out—he and the girl were as thoroughly in love with each other as young man and young woman can be. Many a sweet word, endorsed with sweet kisses, had passed between them, as they wandered together under the moon and stars. This nocturnal kind of wooing is customary in Scotch villages, and a lassie can stay out love-making till the "wee short hour ayont the twal'," without losing her character. But the upshot is always expected to be a new house, a "tocher," and a wedding-ring. So Jock and Jessie were soon recognised as acknowledged sweethearts, who meant to visit the minister, and help to populate the village at no very distant date.

"Jessie," said Jock to that young woman one night, as they were about to take the parting kiss, "Jessie, I hae siller, some, and I hae gear. I'm thinking o' makin' a new house down by the auld ane—a braw new house, with hens and kye. Jessie" (and here he kissed her with a smack). "Jessie, will ye tak' me wi' a' I hae, and be my ain wee wife?"

The proposal was at the least straightforward; but young fellows who mean business do not like rigmarole. Jessie blushed to the tips of her fingers, and trembled a little; but her heart was full, and she felt very proud and happy. She clung closer to her strong young lover, hanging down her head for a moment; till, as if by a

sudden impulse, she lifted up her lips and kissed him fervently. Then she fluttered from his side with a light laugh. But Jock drew her back, as he whispered, smiling slyly :—

"Is it ay or no, Jessie ?"

Jessie blushed a double crimson, and laughed.

"Ye ken best yoursel', Jock," she said.

"Is it ay ?"

"Atweel, Jock," said Jessie, still trying to escape, "I'll speir at mither. Ye ken what that means. Gude nicht."

"Gude nicht, Jessie," quoth Jock, and he stalked off to his own home, the most coolly happy young fellow in Christendom.

That night Jessie laid a head full of busy thoughts on her quiet pillow, and cherished sweet feelings in her girl's heart. She had experienced all the yearnings peculiar to young women. She had felt the indescribable yearning most girls feel,—to pass a career of uneventful happiness, a true wife and a happy mother.

And now, the man of her heart had promised these joys to her, and her humble wishes were realized. As to her stepmother, of course she would only be too proud to hear of the engagement. Jessie would break the good news to her in the morning, and get the matter off her mind. So she slept very peaceably.

Next morning she was up and stirring with the first lark, bustling about the house, and singing

See page 18

to herself with a light heart. Thank goodness, there was plenty of work to do, otherwise I do believe her happiness would have climbed to that pinnacle which suddenly turns liquid and topples over with tears. At breakfast time, she broke the tidings after the following fashion :—

"Mither," she said, abruptly, "ye'll no' guess the gude news I hae to gie ye. It's a' settled, mither, and I'm gaun to marry Jock gin summer next !"

Had Jessie been a very acute observer, or had she been less absorbed in the contemplation of her new hopes, she would have seen Mrs. Cameron's face turn paler than usual. The woman's countenance regained its natural colour in a moment; but her lips quivered, her fingers fidgetted nervously with the table-cloth, and a fierce cat-like look darkened for a moment in her slumberous eyes. Her voice was unchanged, however, and she now spoke in the calm monotonous tones that were usual to her.

"Whatna Jock ?" inquired Mrs. Cameron, after a moment's pause.

"Wha would it be, mither, but Jock Macintyre, o' the smiddy yonder. And, mither, he's gaun to build a new house, and he's weel-to-dae, and he says he'll hae heaps o' siller ane o' these days." And Jessie laughed happily, and began to hum the words of Willie Miller's glorious song :—

Folks wha hae skill o' the bumps on the head,
Hint there's mair ways than toiling o' winning ane's
bread ;
How he'll be a rich man and hae men to work for
him,

Wi' a kyte like a bailie's, shug shugging before him ;
Wi' a face like the moon, sober sonsy, and douce,
And a back, for its breadth, like the side o' a house !

And Jessie laughed, not at all indisposed to think of her husband in such prosperous circumstances. There is always a little spice of worldly economy, on both sides, in these country marriages. As I do not think that love can be supported without porridge and milk, I regard such a state of things in a favourable light. Pastorella with a crook, and Strephon with a cracked lute, are all very well in Arcadia and in Don Quixote's imagination; but in real life, individuals so constituted for doing nothing would bring both themselves and their sheep to grief. I am sure that Jessie would have married Jock even had he been in less prosperous circumstances ; but perhaps she would not have done so with so much confident alacrity. This in passing.

Jessie hummed the lines above quoted, and ended with another laugh. But Mrs. Cameron bit her lips to keep her vexation within bounds, as she said, sharply :

"The deil's in the bairn, I'm thinking ! Awa' wi' your douce dreams, Jessie. Ye'll marry nae Jock till ye're aulder and wiser. You're owre young."

Jessie started, surprised less by the words themselves than by the unusual tone in which they were uttered. She fixed her eyes inquiringly on her stepmother, who crimsoned to the temples.

"Owre young, mither ! Ye hae said yoursel'—"

"I hae said naething o' the sort, and I'm no' gaun to gang demented and say it now."

"But, mither—"

"Dinna 'but' me, but mind what I'm telling ye. Marry Jock if you please, but dinna blame me if ye repent o't. Tak' my warning, and hae naething to dae wi' the minister till Jock's richer and you're aulder. Dinna gang the lang gait wi' him. Mind that, bairn, or ye'll repent o't. Na, na ! tell me nane o' your nonsense ; but be wiselike, and wait a wee. He's as puir as Lazarus, in spite o' a' ye hae said."

Jessie made no answer, but her heart throbbed quickly in her bosom, and her head began to swim. This outburst of her step-mother was beyond her simple comprehension. She left the house to look after the cow, trying hard to fathom the mystery. Outside the door she saw her lover, who was about to open business for the day. He nodded to her with a merry smile from the opposite side of the way, and she answered the greeting with as pleasant a look as possible. She passed round to the back of the cottage, keeping her tears down with an effort ; but when fairly out of sight she began to weep bitterly. She grew calmer by and by, as she walked on in the fresh morning ; and at last the tears ceased altogether, leaving a residuum of bitter determined thoughts.

"She's no' my ain mither, and she's gaun clean daft" (thus ran the girl's reflections). "I ken o' naething that she's done for me or mine ; and I'm no' bound to mak' mysel' miserable for her sake. What if she did marry my faither; that's nae reason that she should undae my faither's dochter. Na, na ! I'll no' lose my lad by waiting and waiting for her bidding ! Jock wants a wife, I ken, and maybe he might tak' up wi' another lass if I kept him on the wrang side. Na, na ! mither. I'm auld enough to ken my ain gait without your bidding."

As people are bound to think in the language in which they speak, I give the substance of Jessie's thoughts in the Doric familiar to her tongue. Those thoughts were not in the strict spirit of ethics, perhaps ; but they were very natural, for all that. Poor lassie ! could she have seen a very little bit into the future, she would have changed her tactics. There was a demon in that dull-eyed step-mother of hers, which time and opportunity were to develop in all its quaint proportions.

The reader has probably guessed the truth. Mrs. Cameron was still a young and good-looking woman ; and if her dull blood was moved to love anything or anybody—it was to love John Macintyre the blacksmith. She has practised all her arts on him—she had done all she could to catch his eye ; but Jock never so much as dreamed of her in the character of a wife. He noticed none of her hints and advances ; nor did Jessie. Perhaps he was blinded a little by the mere fact that she was Jessie's mother; a fact which would unconsciously be suggestive of age and undemonstrative matronhood. This indifference had the effect of making the smouldering passion flash out in bitter anger and fierce sin. The dull-eyed woman was not beaten yet ; and, if she herself could not marry him, had not the slightest intention of allowing Jessie to take her place.

When Jessie returned to the house, her face was very calm and pale, and her lips were tightly clenched. She was a Scotch girl, with a will of her own, and she had made up her mind to assert her right to the matrimonial goods she coveted. She found Mrs. Cameron quite calm and listless, as if nothing very important had occurred.

"Hae ye thought o' my words, Jessie ?" said the dull-eyed woman.

The girl faced about, and eyed the speaker with a look as calm as ice.

"Ay, woman !" she said firmly ; "I hae thocht o' your words, and they're fause and wrangfu' words : I'll hae nae mair o' them. You're no' my ain mither, and you're no' just in your clean senses. I'll marry Jock Macintyre when he says the word, whether ye will it or no'. He's the lad o' my heart ; I'll no' lose him. I hae said it, woman, and I'll stand by it tho' I dee !"

This, to say the least of it, was not respectful ; but Jessie's blood was up, and she could not mince the matter. Mrs. Cameron made a movement, as if she would have risen and struck the girl ; but she conquered the impulse and relapsed into her old self. She repeated some of her former words quite coldly ; but that was all. Thus the matter ended for the time being.

Jessie told Jock of this unaccountable whim of her step-mother ; but he made light of it. It did not interfere with their plans, though the girl felt rather uneasy at breaking the filial law, and could not quite conquer her scruples by the sophism that Mrs. Cameron was her relation only by marriage. She was determined, however. The

young lovers continued to meet as usual, and to talk of the future after lovers' fashion. The dull-eyed woman, strange to say, never alluded to the subject again. She had quarrelled with the girl, indeed, and there was some talk of parting; but it came to nothing. They continued to live together. But clouds were gathering—gathering slowly—in the dull-eyed woman's brain; the flash of the lightning was seen now and then in her still eyes; but the thunder and the rain were yet to come.

In desiring to break off or postpone the marriage, Mrs. Cameron was not influenced so much by her liking for Jock, as by a certain bad purpose which had lately got into her head, and which Jessie's marriage with Jock, or anybody else, might frustrate. She kept this purpose carefully hidden under her quiet face, until necessity compelled her to execute it. For some months past (the better to ensure the success of her scheme) she had never once ventured out to the church, but had pleaded indisposition. The minister dropped in now and then to chat with and console her, for she was one of his most pious parishioners. She did very little of the household work, but sat most of the day in the big armchair, with her dull blue eyes fixed on the fire, hiding the projected sin. She was the better enabled to indulge herself, because her husband had left her a few pounds at his death.

The months rolled on; winter passed with his snows and gales, and was followed by the fair winds and soft rains of early spring. Jessie and Jock met once, sometimes twice a week—always by night—when the daily toil was over. But every evening that Jessie stole out from the little cottage, the dull-eyed woman threw a shawl over her head and followed, turning off in another direction when outside the door. Generally on her return home, her step-mother was fast asleep in bed; sometimes she sat in the arm-chair peevishly chiding the girl for staying out of doors so late.

One night Jessie stole out later than usual to meet her lover. The night was dark and warm, and the two young people strolled along the highway for more than a mile. Jock's arm was round Jessie's waist, and he was whispering soft words to her as they walked along. There were no stars out, and the moon was hid; light vapoury clouds were sailing swiftly across the sky, squadroned by a silent wind. The lovers could just see each other's faces.

They were turning round a curve of the highway when they passed a woman and a man, the latter, who wore a gamekeeper's coat, far gone in liquor. The woman's face was hid in an old shawl; she shrank back into the darkness with a frightened air as the lovers walked by. The man staggered forward with an oath, and caught hold of Jessie's arm with a rough grasp. Jock, when he had knocked the offender down, recognised him as the gamekeeper of a neighbouring landowner, Sir Hugh Mucklewraith. The lovers passed on amid a volley of coarse abuse from the fallen man. Jessie felt the least bit frightened; but strong Jock soon reassured her, and they were again absorbed in the old sweet theme.

On the following morning Mrs. Cameron's face wore a strange scared look. The dull-eyed woman spoke in her usual tone; but her voice trembled a little, and her blue eyes flinched as they met those of her step-daughter.

"You were out lang last nicht, my lassie?" she said, with a queer smile.

"Ay, mither," said Jessie, calmly enough. But the girl felt weary and said no more. After a short pause Mrs. Cameron spoke again.

"Jessie, I maun gang awa' Edinbro' ways the morn's morn,—to the wee bit village whaur my sister Jean stays wi' her gudeman. It's twal mile and a bittock frae here, and I maun e'en tak' the Edinbro' coach. I'll maybe be awa' ae week and aiblins twa. Ye'll hae to keep the house by yoursel' a wee."

"And what for are ye gaun awa', mither?" asked Jessie, who was a little surprised by the statement.

"I canna help it, lassie. I'm weel enough now, and I hae had word this day about Jean. (Ye dinna mind her; ye haena seen her face since ye were a wee bit thing. She's a heap aulder than me.) She's lyin' badly wi' the sma'-pox, puir woman, and I maun dae what I can to bring her roun'. It wadna look kind-like if I stayed awa'."

This coming from a person who was too ill to venture out to church or go visiting a sick neighbour rather staggered Jessie. But she was not a suspicious girl, and never for a moment doubted the truth of her step-mother's statement. She made no objection, however surprised she felt at the suddenness of the necessity.

The coach was to pass through the little village at twelve noon. Mrs. Cameron was ready by eleven. A large basketful of "sweet bits" for the invalid was slung on her arm. It happened that the basket had no cover; and, as the dull-eyed woman did not want everybody to pry into its contents, she was obliged to keep her large shawl flung well forward over it. There were sharper eyes than poor inexperienced Jessie's in that cannie village. The traveller left Jessie busy in the house, and betook herself (ostensibly) to the cross in the centre of the village, where the coach stopped for two minutes on its onward journey. She would not listen to Jessie, who proposed to carry her basket to the place of starting.

A week passed by and Mrs. Cameron did not return. The lovers met only once that week, for Jessie was more than usually busy. Jock was busy too. He toiled at the big bellows all day long: thinking, no doubt, of the dark-eyed lassie on the other side of the way.

Nine days had passed since Mrs. Cameron left home. It was a dark windy night; but Jessie lay fast asleep in the little cottage, dreaming of Jock. The day's work had been hard. She slept heavily, as only hard-working people sleep. Had her sleep been lighter at the dead hour of the night, when the wind was whistling loudly outside, and darkness lay over the valley like a pall, had her sleep been lighter that noisy night, this true story would never have been written.

There were two rooms in the cottage; in the inner of the two slept Jessie, with the door bolted. The other was the kitchen, in the corner of which was an empty bed. The outer door of

all was secured simply by the latch of the lock, and this could only be opened by the proper or a false key. But they had no fear of midnight intruders in those parts. There was nothing in the poor peasants' cottages of sufficient value to tempt a thief.

At the dead hour of the night, when all was still and calm, the cottage-door was unlocked without a sound, and a dark figure stole in on tiptoe, pausing now and then to listen. The inner door was firmly shut. All seemed safe; the girl was fast asleep. The wind whistled without incessantly. The figure groped its way silently to the kitchen-bed. Then it drew from its bosom something which looked like a large white bundle, and laid it on the bed with a noiseless hand. Jessie slept on, unconscious of this strange visitor. A moment afterwards the dark figure again glided over the threshold, closed the door stealthily behind it, and stood alone in the dark street. Here it paused for a moment, muttering to itself; then it fled hastily through the darkness. It rushed swiftly onward, never once pausing, till it halted by the side of a dark wood, situated some five or six miles from the village. It stood still for a minute, trembling from head to foot. Presently it stepped over the low stone wall and entered the plantation, wandering along through the trees till it left them in a black shadow at its back. It stood beside a quiet cottage at the further corner of the wood; and, tapping at the dark pane, it trembled worse than ever. The door was opened a moment afterwards by a rough-looking man in a gamekeeper's coat.

"The Lord be thankit, Rab, for it's a' owre now. I hae dune it, Rab,—I hae dune it. She slept like a peerie, wi' her door fast snibbit."

The man in the gamekeeper's coat, familiarly addressed as Rab, cocked his eye at the speaker, gave a grunt, and shrugged his shoulders.

"It's no' a canny nicht's work," said Rab; "I dinna feel sae sure about it. I wadna hae helpit ye ava in the matter, wi' nae ither raeson than the ane. It's hard on the lassie; but it'll tak' the gumption out o' the lad. Dinna glower there, woman! Come in wi' ye; I'm no' gaun to stand here a' nicht. It's dune now, and I maun e'en mak' the best o't."

The woman entered and the door closed with a bang. The cottage, like most others thereabouts, contained a kitchen and a bed-room. A fire was lighted in the former, and on the table were glasses and a bottle containing whiskey. On one part of the dirty wall a shot-pouch and a powder-flask were hung on a rusty nail; a gun was slung across the ingle. The woman, still violently trembling, drew close to the fire; pouring out half a glass of raw spirits, she drank it hastily. The man continued to mutter to himself, cursing the night's business and eyeing the woman with a hang-dog air. But he seemed somewhat afraid of his companion.

"Hoot-toot, man!" said the woman pettishly. "Dinna fash your fule's head about naething ava. It's a bad job weel mendit. I ken the lassie weel; a's safe. She'll bring the town about her head the morn's morn, or I'm dafter than ye think me. And whatna story can she tell the folk but ane that a'body 'll ca' a silly lee, made up to save hersel' frae the shame o' the sin. A's safe, man; keep up heart."

Rab shook his ugly head incredulously, and continued to mutter his doubts. The wind roared, and the night wore on, till the grey dawn broke dimly on the strange pair where they sat alone, hid from human observation. The hearts of both were beating loudly, for the woman was weak and the man was a coward. They were trembling for the consequences of the midnight act.

"She'll hae seen it now, Rab; she'll be wakened now! I'm feared, I'm feared!"

"Onybody micht see that in your face, I'm thinkin'. I was daft to hae aught to dae wi 't," said the man in the gamekeeper's coat.

"Ye were bound to stand by your ain, Rab Simpson; the wrang belanged to baith o' us."

"Worse luck," said Rab.

"Ay!" said the woman, in tones full of bitter meaning. A cat-like look, full of fierce hate, gleamed for an instant in a pair of dull blue eyes.

CHAPTER II.

The dull grey dawn was breaking dimly when Jessie Cameron opened her eyes. She had slept heavily throughout the night, and her slumbers had been visited by pleasant dreams of Jock and little children. She was soon up and dressed, ready to commence the day's work. She threw open the shutters of her bed-room and gazed out; the rain was falling with a dull monotonous music, and the winds that had whistled all night long were laid. Unlocking the door of the room, she entered the kitchen, singing to herself with a light heart. All was still and dark, till she threw open the kitchen shutters. She was about to open the outer door, when a low sobbing sound broke suddenly on the silence; she started and turned pale. She turned hurriedly round, but saw nothing unusual. But the low sobbing sound, which had ceased for an instant as she listened, was repeated.

Jesse walked towards the bed trembling all over. The mystery was cleared in a moment. Wrapt in an old shawl, and lying half-awake on the pillow, she saw a little baby, very pinky in the face, and with open querulous eyes.

She was stunned with the surprise; her head swam, and her heart began to throb violently. But she was a strong girl, and did not faint. She stood with her mouth and eyes wide open, and her hands lifted, utterly lost in astonishment. She had no time to reflect; but the thing was incomprehensible. Pressing her hands to her temples, she sank into a chair with a suppressed cry. It seemed like a strange dream. Might it not be a dream indeed? To make the matter certain, she rose up and peeped again at the intruder.

It was the smallest and the pinkest of babies; a preposterously babyish baby, with puffed pinky cheeks, and a head as bare as St. Dunstan's shaven poll. Its great staring blue eyes were wide open, busy in astonished contemplation; its red crimpled tiny fist was in its mouth instead of a lollipop; its little fat toes were poked out kicking from underneath the shawl. Plainly, a careless baby, new to the world of men and women.

It was not till the baby began to cry after babies' fashion, that Jessie began to comprehend

the consequences of its presence in that house. Who would believe her incredible story? Certainly not those incredulous canny queer folk of which a Lowland Scotch village is composed. The purpose of the wretched mother seemed evident; she had sinned the woman's sin, and was attempting to throw the shame on innocent shoulders. What could poor frightened Jessie plead to save herself in her great dilemma? Nothing satisfactory. Sins of that sort had often been cleverly concealed until the appearance of the new-born accuser. No one would believe her. Heaven seemed against her. She was lost.

By a sudden affrighted impulse she had lifted up the child, and was lulling it on her bosom as these thoughts passed through her brain. Every sound startled her as she did so. What if some of the neighbours should hear the cries? She walked up and down the house, trembling all over, holding the baby in her arms. It was soon quieted; the great staring blue eyes resumed their composure, and the sucking operation was resumed. The pale morning light fell upon the girl's pale frightened face, blinding her; she closed the shutters. She felt as if she would go mad if the tears did not come to relieve her; but they came not—they were scorched up by her great fear.

The woman in the gamekeeper's cottage was wrong. Jessie never attempted to alarm the neighbours. Her clear Scotch head detected the whole danger of her situation at once. A medical man might have cleared her, had she thought of that alternative; but there was no doctor in that neighbourhood. The simple fact of the imputation staggered her. But it would have been better far had she alarmed the neighbours; by her secrecy she only laid herself open to more suspicion.

A fierce black element of her nature—an element which lies ready in most natures, but is not always developed by circumstances—was uppermost in her bosom once or twice. She thought of her lover and the slanderous tongues of the villagers. A mad impulse to make away with the child seized upon her; her face darkened, her fingers twitched, and only a strong effort prevented her from strangling the child as it lay, so quietly, in her arms.

Then the womanly instinct arose in her, and conquered all other feelings. She understood the pleading of the little wide eyes, the small pinky face, beaming so innocently with the new life that sinners had given it. Her heart softened. The first scalding tears fell over her cheek; the full fresh torrent burst out, and she wept like a child. The small baby fell asleep. She placed it in bed, tucking it up as tenderly as if it had been her own. Then it was tears, tears, tears.

But the tears exhausted themselves in time; the girl became pale and calm. Her brain was again busy with the strange mystery. She moved to the door; there were no marks of violence; it must have been opened, if opened at all, by a false key. She tried the window next, but found nothing to determine her suspicions; it was firmly shut and bolted, and nobody could have opened it without first breaking the pane. Yes! there was only one clue to the mystery. Somebody must have possessed a latch-key fitting the outer door, and have used it for the purpose of entering during the night. But somehow or other, Jessie did not feel quite satisfied with this solution of the riddle.

Oh! that her stepmother were there to advise her! Even that woman, she thought, would help to relieve her great fear. What was to be done?

The time rolled on. The village was astir; there was a sound of feet and voices. But still Jessie Cameron sat in the little cottage, her head hidden in her hands and her heart quivering through all its pulses. There was no fire in the grate, the shutters were closed, and the place was dark and cold.

Hark! the baby began to cry again! She sprang to her feet, lifted the child from the bed; but in vain. Luckily it struck her that the little thing might want food. There was milk on the dresser; she took it down and broke bread into it. With trembling hands, she began to feed the child.

The morning was wearing on. Jock supped his porridge, put on his coat, and made his way to the smithy. He paused opposite the cottage, but there was nobody visible. Whistling a tune, he took down his shutters. He turned round to look over the way again. The door of the cottage was closed, and the shutters were up. Queer, thought Jock. He entered the smithy and commenced work. No use; he found himself shaking his head, looking over the way, and wondering.

"Can onything hae gane wrang wi' the lassie?" said Jock to himself.

The bare thought of such a thing was painful. He threw down his tools and stood hesitating.

"I maun e'en gang ower and see if a's richt wi' her," he said.

He walked across the street and paused outside the cottage door. A low sobbing sound fell on his ears as he did so. He trembled in spite of himself. He knocked softly. No answer. Strange, he thought. He tried the door quietly, and found it unlocked. He pushed it open and looked in. There was a loud startled cry inside. His eyes fell upon Jessie Cameron, with the baby on her lap.

His heart leaped up into his mouth. The terrible thought which Jessie dreaded flashed upon him. Jessie could not speak; her tongue refused its office. The man walked over with a fierce look, and placed a firm hand on her shoulders.

"Wha's wean hae ye there, Jessie Cameron?" he said, between his set teeth. But the girl made no answer; she sat with a dull, stupid look, white as snow.

"Wha's wean hae ye there, I'm askin' ye?" he repeated, savagely.

Then, sobbing as if her heart would break, Jessse fell at his feet, with the child in her arms. His suspicions were confirmed by her pale haggard look, and her frightened gestures. She told him the story at last, with hurried words and beseeching looks; the hot true tears fell on the child's face as she spoke. But he broke out into oaths and bitter curses. Anger at the silly audacity of her falsehood was mingled with anger at her sin. How he would be laughed and pointed at! He felt no pity. His love, which had never been of the most sublimated or unselfish kind, was insulted and wronged. His coarse abuse was horrible to

hear. He called her by the foulest of woman's names, and almost struck her. Then it was that her tears ceased. Her blood began to rise; her eyes lost their look of mild reproach, and kindled into rage. She rose up, with the child in her arms, flushed with passion. She pointed to the door, talking thickly. She placed the baby on the bed, and cried:

"Out o' this house, man!—and God forgie ye for your fause leein' names. Awa', I say, ye coward! Ye fause-hearted, puir-spirited coward! Awa wi' ye!"

He retreated unconsciously, before her dark flushing face.

"Shame on ye for a sinner, Jessie Cameron!" he cried fiercely, as he crossed the threshold. She closed the door after him. The place swam round her—dark blots floated before her eyes—and she fell on the floor heavily, with a hysterical sob. The excitement had been too much for her.

There she lay, a thing piteous to see, with only half her senses about her, the most innocent of human beings. The hours passed on; but there she lay, oblivious to all save her own misfortune. The baby fell asleep, and lay quiet as a lamb.

If the reader has followed me thus far, he will have detected the stupid clumsiness of the scheme adopted by the mother of the infant. I have already observed that a medical man could soon have cast new light upon the affair by exonerating Jessie. So, for that matter, could any matron in the village. The perpetrator of the villany had never thought of this. Obviously, she was a silly, ignorant woman, driven to despair through her dread of public exposure, and had thoughtlessly hazarded the dangerous expedient. It was certain that the truth—or the part of it which related to the innocent girl—must come out sooner or later. The scheme was rotten in itself, and would not stand the test of severe examination.

Jessie never dreamed of these hopes; she was overcome by the sense of danger. Jock was still blinder. He had not been bred up among perfect people; sins of the kind were common enough in most country places. He was of the Scotch breed, Scotchy, and did not take all externals for granted. Besides, Jessie's face, pretty as it was, had not driven him crazy: he was fully aware that his sweetheart might have her little weaknesses—and her great ones. When he thought of a wife he acted like a man buying a cheese, in a cheese shop where the cheeses are many; he took the best and most profitable he could set eyes on. So he condescended to vulgar abuse, got into a violent passion, and, not having paid for it, thought fit to return his cheese as hard and hollow. Mind, I am not making a hero; I am simply describing a man. He neither tore his hair, nor went up in a balloon. He simply felt that he was an ill-used fellow, and that Jessie deserved all the odium that might be cast upon her. He never for a moment doubted her guilt; the circumstantial evidence fairly conquered his country head. He set to work, a little down-hearted, and made up his mind to a bad job. I am of course aware that he ought to have gone into heroics, and that my romantic reader will deem him a poor apology for a lover. Take him for what he is worth. There he is; and I assure you that you will meet with many like him in every Scotch village.

Jessie Cameron lay where she had fallen, with her head on the hearthstone. The hours passed slowly by, till it was mid-day. She rose at last, and walked instinctively to the bedside. Somehow or other, the child slept on, belying the childish nature. She bent over the little sleeper with the tears in her eyes.

"Puir wee thing," she said, sadly, "ye hae fa'un on a sad warl. Oh, but ye're bonnie, bonnie, wi' your wee blue een and snaw-white brow! Ye come o' a bad lot, my wee bit bairn; the Lord hae pity on ye."

The girl started: there was a knock at the door. She made no answer, and stood stock-still, fear-stricken. There was a slight pause. A moment afterwards the lock moved, the door opened, and Mrs. Cameron entered, the big basket on her arm and the latch-key, which she had seemingly taken with her, in her hand. Plainly, she had not calculated on finding her step-daughter within. She started back with a low cry. The dull-eyed woman was thinner and paler than usual. She had the appearance of a person who had just recovered from a violent illness.

Jessie was about to rush forward, and pour the whole strange story into her stepmother's ears, when the latch-key caught her eye. I don't know how it happened, but she restrained herself in the sudden movement. A thought struck her, as new as it was fearful and extraordinary. She looked into the dull-eyed woman's face; it was white with terror. The thought doubled and trebled itself in a moment; it became a terrible conviction. Some few suspicious recollections arose to endorse it. She ran quickly into the inner room. Strange to say, Mrs. Cameron seemed utterly stunned. Once or twice her lips attempted to utter words of anger and abuse; but the words died away unheard. The girl's face seemed to appal and startle her. A cold sweat ran over her body. She was speechless and unable to move from the threshold.

Jessie returned to the kitchen in a moment, with her bonnet and shawl thrown loosely on. Her face was very pale, her lips were set closely together, and her hands were tightly clenched. But utter pity, not cruelty, was in her heart. As she walked calmly by the panic-stricken woman, she whispered hotly in her ears:

"If God forgies ye for the wrang ye hae wrought, woman, sae dae I. For the sake o' the faither that's gane, I forgie ye. I wadna tell on ye, and folk would ca' me leear if I did. Nae words o' mine shall say wha sinned the sin, and cam' to my dead faither's house i' the nicht, to wrang my faither's dochter. But look whaur it sleeps, the wee wean! Ye maun keep your ain!" She passed swiftly through the door into the street. The dull-eyed woman followed, and watched her till she disappeared. She had taken to one of the roads which led out of the village.

Mrs. Cameron was reassured by those last words—the only absolutely heroic words simple Jessie Cameron ever spoke. Her dull eyes brightened. She found herself strong enough to run

among the neighbours, weeping maudlin tears and crying shame on her stepdaughter's head. If talking is a proof of grief, she was very grieved indeed. The news of the affair soon spread over the village, and poor Mrs. Cameron was much sympathised with and pitied. One circumstance gave her the look of a martyr. The child was not to be blamed, she asseverated weeping; no. Her cruel, heartless daughter had left it behind her; but no matter. She herself would be a mother to it. You must imagine how the women praised this soft-hearted angel, who took so tenderly to the little innocent child.

I have little more to tell, and I will not exhaust my reader's patience in telling it. The whole truth came out in good time. A year and some months after Jessie's departure, the cholera passed over the village. Mrs. Cameron was one of its many victims. Before her death, this woman told the whole story to the minister, who lost no time in communicating it to Jock. The baby was her own; it had been born three days after her departure on a pretended visit to her sister. The place of its birth was the cottage of its father, Rab Simpson, a dissolute rascal who lived alone, and who reluctantly consented to receive the frightened mother. She asserted most positively that the crime had not been premeditated; it was suddenly suggested by her dread of shame and ignominy. On her departure from home, she had found the key among the loose things in her pocket, and the fact of its being in her possession had induced her to make the midnight visit. She had quieted the babe with laudanum before leaving it in the cottage. The minister sought for Simpson, who could have established the truth of this statement, but he had gone off (in a drunken fit) to the colonies.

Jock felt terribly down-hearted after this. For two or three months he tried in vain to find out his quondam sweetheart. He ascertained that, immediately on her departure from home, she had gone to a small town about thirty miles distant. There she had taken a farmer's fee, under an assumed name, and had become a farm-servant. He tracked her from this place to Edinburgh, and thence to Glasgow, where he found her, on the point of emigrating to Australia. He repeated the old offer of marriage. But Jessie shook her head. She could never forget his cruel words, she said. The old love was gone; it was never a deep, all-absorbing love, and now it was all gone. She was deaf to his entreaties.

When Jessie Cameron sailed for Australia, the baby went with her; she adopted it then and there, as the only one of its relations who was willing to do so. She went out as a widow. What became of her and the child afterwards, goodness knows. I should like to chronicle some piece of unusual prosperity: but it is impossible. I have told all I know about the matter. B.

THE BASHKIRS.

The Russian provinces bordering on the Gulf of Finland and the Baltic Sea were, during the last war, in consequence of the drain of troops to the south, partially garrisoned by the Bashkirs, who constitute a specific portion of the Russian army, under the name of the Bashkir force, being divided into cohorts, each of which is commanded by a separate leader, who is always a native Bashkir. During the French invasion and retreat under the First Napoleon the Bashkirs were much more generally armed with bows and arrows instead of muskets than they are at the present day, and from this circumstance they obtained from their invaders the nickname of "Les Amours du Nord."

The settlements of the Bashkirs are confined to the provinces or governments of Perm and Orenburgh, and their central point, or chief town, is Oufa, which was founded for the express purpose of their government. The Bashkirs submitted themselves voluntarily to the dominion of Russia, in the sixteenth century, shortly after the conquest of the kingdom of Kazan by Ivan the Terrible.

The Bashkirs are all Mahometans; but, from a difference in their mode of life, they may be divided into the stationary and the partially nomadic. The first, being almost entirely occupied with agriculture, reside in villages composed of strongly-built houses; the latter also possess houses, but they are of a slighter construction, and during the two summer months of June and July the Bashkirs abandon them, to wander round about their neighbourhood, for the sake of pasture, as the rearing and feeding of cattle form the exclusive sources of their wealth. During this season they dwell in kibitkas, or koshys, which are portable dwellings, with roofs in the form of a hemisphere, and containing within a good-sized room with a vaulted ceiling. The size of the kibitka varies according to the wants or means of the possessors, but one of medium dimension will measure about six yards in diameter, and it is constructed of five or six frames of trellis-work, which being fastened together by animal sinews or leathern straps constitute its walls. An open space is left between two of these trellis-frames, into which is fitted a wooden doorway to receive a door either of one or two wings. Over and upon the walls is placed the dome, or cupola, consisting of a stout hoop, from which spring a number of shafts all curving inwards and meeting together in the centre of the kibitka. The straight ends of the shafts or poles, projecting below the hoop, are bound to the trellis-frames by thongs or cords. The whole edifice is then covered with long strips of felt, which, among the most wealthy, is of a pure white, but of a grey colour among the poorer people. And, finally, the felt covering is secured by being bound round with hair-bands plaited from the manes and tails of horses, which are cropped for the purpose till they complete the third year of their age. In violent windy weather the kibitka is secured by ropes to several stakes driven into the ground around it.

Within the kibitka the walls are hung round with either cotton or woollen stuffs, and a curtain stretched across, beginning from the door, divides the internal space into two compartments of unequal size, the larger being occupied by the men, and the smaller by the women; but on special occasions of festivity this curtain is removed to

afford more room to the invited guests. The furniture within the kibitkas is almost alike in them all. Against the wall is placed the bedstead, with a bed not over luxurious, but covered with a cotton counterpane. Around the sides are arranged the tubs, chests, benches, the tea-urn with its appurtenances, the pails, the toorzooks (or skins to contain koumuyce), kettles, and other domestic utensils. The gaudiest adornment of the kibitkas consists of the vivid-coloured habiliments, both for male and female use, which are displayed upon slender rods; to these may be added their arms, their horse-trappings, and various implements for the chase; and, lastly, the carpets laid over the benches and chests, and even also on the ground over a protecting layer of felt.

The stationary Bashkirs pay a tribute in money to the imperial treasury, but the half-nomadic tribes discharge their dues by personal service, constituting the Bashkir force.

The favourite beverage of the Bashkirs is koumuyce, a liquor readily prepared from mare's milk by bringing it into a state of fermentation, which is allowed to continue till it reaches the acetous stage, when it becomes fit for use. It is made by adding an indefinite quantity of fresh, unskimmed mare's milk to some old koumuyce, and the compound, being well stirred, is placed in some warm situation in the dwelling-place, where the fermentation is soon propagated by the older portion of the mixture through the new milk till the whole is converted into normal koumuyce. In default of old koumuyce common cow's milk made sour may be used instead for a commencement; but, in all cases, the process is accelerated by warmth and agitation. Koumuyce is white like milk, and has a subacid taste; but this depends upon its age, which increases its acidity. It is sometimes, for economy, diluted with water, a moderate admixture of which assists the fermentation, improves the flavour, and renders it more intoxicating. Pure koumuyce effervesces like champagne, and, if shaken before it is poured out, it hisses, froths, and even expels the cork. The liquor sometimes has the flavour of bitter almonds, which proceeds from the nature of the grass pastured on by the animal, and this kind of koumuyce is highly prized by the connoisseurs. The koumuyce is kept in leathern bottles, called toorzooks, made from the skin of a horse's hind quarter, taken off entire. The hair is singed off and the skin smoked. To the broader part is sewed a bottom, while the narrower, cut off at the knee, forms the neck of the vessel, which is stopped up with sedge or rushes. This forms a toorzook, which, standing on its bottom, has the appearance of a ham—being, in fact, the ham of a horse. Koumuyce, though inebriating, yet, even when taken in large quantities, occasions no inconvenience to the stomach. The Bashkirs drink enormous quantities with impunity. On holidays, when visiting each other, they sit for whole days drinking koumuyce, till they become so paralysed as to be unable to close their fingers into a fist, and yet recover, feeling no bad effects to remain. Copious draughts of it have even a strengthening effect, and are employed in certain diseases.

SOME NOTES ON THE TOBACCO COLLEGE OF KING FREDERICK WILLIAM THE FIRST OF PRUSSIA.

Republican equality, though questionable in practice, seems to be an innate feeling of the mind, and inseparable from at least social amusement and rational intercourse. Not even despots can find pleasure in society without divesting themselves at such moments of their usual arbitrary will and authority, which necessarily exclude free conversation and exchange of thoughts. The necessity for such a free intercourse was so intensely felt by the above-mentioned stern and despotic prince, that he thought fit to establish a sort of Liberal club, under the name of "Tobacco College," where he could indulge in all the free discussions on the political events of the day.

That prince used to hold a sort of a smoking conversazione every afternoon at five o'clock in his private study. The company consisted of six or eight of the generals and staff officers of his suite, as also of captains famous for their general information and conversational powers. To this party were also invited literary and scientific travellers who happened to pass through Berlin. All the guests assembled were served with pipes and tobacco. The old Prince of Dessau, who did not smoke, was obliged to hold in his mouth a cold pipe, while the Austrian ambassador, Count Seckendorf, even managed to give himself the appearance of an inveterate smoker by puffing with his lips, between which he held a cold pipe. The pipes—of which there is still a complete collection in the Museum of Arts at Berlin—were short and of common Dutch clay, and kept in simple cases of wood. Those (the cases) of the king's pipes were mounted with silver, and were besides adorned with some neat carvings. All the pipes in that collection are so oil-coloured as to indicate a long use of smoking. The tobacco, small Dutch leaves, stood in little baskets upon the table, and at the side of them small pans with ignited turf. The king showed anger if any of the guests happened to bring with him his own better tobacco. Before every guest was placed a tumbler and a white jug with beer. As no servants were in the room, the guests helped themselves to the contents. At seven, bread, butter, and cheese were served up, while ham and roast veal were sometimes placed at a side-table for those who wished to cut a slice for themselves. At other times, the king regaled his guests with a dish of fish and salad, the latter being dressed with his own hands.

Also subaltern officers, distinguished for knowledge or humorous wit, were admitted to the party. Two lieutenants especially, Gröben and Leben, were always cheerfully received, for the merry tricks they played upon the erudite Court Fool, Baron Gundling, and his witty retorts upon them. On one occasion when Leben was speaking of his estates in the sandy parts of Pomerania, Gundling asked him if he was aware that allusion is made to them in Porsten's Hymns. "No," was the reply. Gundling then recited the following verse: "What are the goods of *Life* (Leben in German) but a handful of sand," &c.

Frederick William was particularly anxious to

have in his party some men familiar with History, Geography, Political Economy, and other practical sciences, who made speeches, or dwelt on the topics of the day in a conversational way, so as to lead to debate and discussion.

French, Dutch, and German papers always lay on the table, the leaders of which supplied the company with matter for conversation. The king felt much interest in, and had even read to him aloud, all the strictures made in the papers against his government and himself; after which he used to defend himself before the company by ready wit and sensible observations.

The "Netherland Current," a Dutch paper of large circulation at that period, once informed its readers that recently a corporal of the tall Grenadier Guard had suddenly died at Potsdam, who, after dissection, was found to have had two large stomachs, but no heart. On this being read to him by one of the company, the king at once penned a note to the editor, saying, that the fact related was perfectly true, but that the deceased was a native, a Dutchman, who had enlisted in the Prussian service. By way of change, the king allowed the company to amuse themselves with a game of chess or draughts, but would not tolerate cards. He himself sometimes played backgammon with General Flauss, a blunt Pomeranian nobleman, who, on the king proposing to him one day to render the game more interesting by the stake of a groschen, flatly refused to accede to the proposal, saying: "Your majesty gets so angry on losing a game when played for love, that I expect every time to have the dice thrown at my head; what might I not expect, should your majesty happen to lose a groschen into the bargain!"

Frederick William not only allowed such free jokes to pass, but even encouraged the company to indulge in them, even at his own expense, to render the evenings free, easy, and pleasant. At a later period, when he began to suspect treason in his nearest relations and the immediate members of his suite, such as the Prince of Anhalt and other illustrious personages, the king selected for his smoking companions at Potsdam a few of the notable citizens of the place. When at Wüsterhausen, he frequently invited the schoolmaster of the small place to the smoking entertainment. The latter had by this means acquired such a high respect among his pupils, that they considered him a far superior authority to even the king himself, whom, on his once ordering the boys on their leaving the school door to sing out, "Our schoolmaster is an ass," they flatly refused to obey.

The most welcome guest in the College was Stanislaus, King of Poland, during his stay in Berlin in 1735, when he and the king used to smoke for a wager, each finishing from thirty to thirty-two pipes in the course of the evening.

The young princes usually entered the Tobacco College in the evening, to bid their father good night. On that occasion they were there drilled for half an hour by one of the officers present. When the Crown Prince (afterwards Frederic the Great) became of age, he was obliged to join the College, though he detested both smoking and the fool's tricks.

The king wished to appear in that company as a private individual, and he therefore forbade all ceremonial salutations, so that nobody took the least notice of his entrance or exit. This equality of rank was carried to such a degree, that the king sought satisfaction in a common challenge for any affront offered him by any one of the company in the course of the evening. Major Fürgas, one evening, indulged in some critical remarks on the immoral conduct of some of the favourite courtiers of the king. The latter got angry, and called him a fool. "It's only a blackguard," retorted the other, "who would dare to apply to me such an epithet," saying which, he rose and quitted the room. Frederick William then declared to the assembly that, as an honest soldier, he could not brook the insult, and that he was therefore resolved to fight the Major with swords or pistols. The company, however, strongly protested against the proceeding, and an arrangement was finally made that the duel should take place by proxy on the Royal part. Major Eisendel at once offered himself as the king's champion, and the duel was fought next day with swords, when Eisendel was slightly wounded in the arm. On presenting himself to the king, the latter thanked him, and slinging round him a musketeer's knapsack, asked him if he had any objection to march thus through the streets, if the knapsack was filled with hard thalers. Eisendel having replied in the negative, the king filled it, and giving the command, "March!" Eisendel walked home, well satisfied with the adventure. M.

WHAT IS COAL?

ONE of the most widely disputed questions of the present day, yet one on which there are perhaps more points of agreement than on almost any other, is that which has lately been so ardently contested—*What is coal?* It might appear, at first sight, that there could be no difficulty in answering this question, for who is there who does not suppose that he knows coal when he sees it? "Where ignorance is bliss, 'twere folly to be wise," and but for a want of agreement among philosophers, we might have been content to believe that coal is coal.

In the year 1853, a remarkable trial took place in Edinburgh, which it might have been expected would have set at rest the question—what is coal? Not so; for although the trial lasted for six days, it opened wider than ever the portals of difference, and led to a succession of law-suits, each more involved than the last, and each bringing into the arena more numerous disputants and less prospect of agreement.

In the county of Linlithgow, and within a few miles of Edinburgh, there is a property of ancient tenure, celebrated for its coal and mineral formations, called Tarbanehill, and, in the year 1850, the owner of this property entered into a lease with certain coalmasters in the neighbourhood, in which it was conditioned that such lease was to comprehend the whole of the coal, ironstone, iron ore, limestone, and fire-clay therein found, but was not to include copper or any other minerals than those specified; and the tenants were to be allowed the first year of the lease without the

payment of fixed rent, in order to enable them to make a search for other minerals besides those to which they were entitled by the terms of the lease, with a view to working them, if discovered, on other terms. Time wore on; and in 1852, two years from the date of the lease, circumstances came to the knowledge of the proprietor, from which he gathered that the lessees were turning out a valuable substance, not comprehended by the terms of the lease, neither coal nor any of the other minerals therein specified; and after satisfying himself upon the point, the owner of the property intimated to the tenants that the working of this substance must cease, while the tenants, taking a different view, maintained that they were working a gas-coal, to which they were entitled by the terms of the agreement.

Thus a controversy arose, and in order to aim at a decision of the question, an action was brought by the proprietor of the lands at Tarbanehill against the tenants, who were said to have infringed the terms of the lease by carrying away a substance that was not coal, but some other valuable mineral.

With a view to obtaining a conclusion which should be based on scientific data, Europe was searched for men of mark in the scientific world. Men who had arrived at the highest eminence in natural philosophy—men who had devoted themselves to the study of physical science—men who had made geology their leading study—men whose attention to microscopic botany peculiarly fitted them for forming an opinion—men who arrived at their conclusions by means of the study of mineralogy and chemistry — and, lastly, men who had passed their whole time in mines or mining pursuits were summoned to declare their views upon this vexed question.

Yet was it in no degree set at rest. After six days of debate, the philosophers, the geologists, the microscopists, the histologists, the mineralogists, the chemists, the miners, and the managers have, on the one side, such strong testimony that the substance was *not* coal, that the matter would have seemed clouded by no doubt, had not a similar array of evidence on the other side unhesitatingly brought arguments to show that it *was* coal, thus rendering arbitration on the subject more difficult and more remote than ever.

In order to understand how such contradictory arguments could be adduced on this celebrated trial, we must endeavour to have a general conception of what is intended by the term coal.

Looking back to that remote and indefined period "dateless as eternity," and described by Coleridge as a state rather than a time, we recede into those extinct creations of a strange order, which constitute the penetralia of the carboniferous forest, and enter the period of the gigantic and magnificent flora of the coal measures. There, in that ancient scenery, with its amazing development of vegetation, unique in the history of creation, forms arose amid the steaming vapours of the time in rich and luxuriant grandeur. Amongst forests of arboraceous ferns, tall as trees, sprung up huge club masses, thicker than the body of a man; and thickets of Equisetaceæ or horse-tail, of prodigious growth, covered the marshes. There flourished the Vlodendron with its strips of cones adorning in vertical rows its carved trunks, its stems covered with leaf-like carvings, passing in elegance the minutest tracery of which *we* have any conception. There grew the Sigillaria, remarkable for their beautifully sculptured and tattooed stems, varying in pattern according to their species, and longitudinally lined with rows of leaves bristling from the stems and larger boughs, while their roots or stigmaria were fretted over and ornamented with eyelet holes curiously connected by delicately waved lines. There also gigantic Cacti, of intertropical growth, varied the landscape, and there too were Palms and Canes. Last and not least were the true forest trees of that era—the Pines and the noble Araucarians, the latter attaining a height of a hundred and fifty feet—three times that of our own forest trees. All these were loaded with cones; on all, cones were the only productions corresponding to fruit —fruit unfit and vegetation unadapted for food; and as in that age there were no herbivorous animals, there needed no provision in these primeval forests for such a race.

Yet the period of this flora was not less remarkable for its fauna; but it was an age of creeping things. There were reptiles and reptile fishes, which attained an enormous size, with defensive weapons of amazing strength, and some of them covered with enamelled scales of exquisite polish; there were sharks armed with razor-like teeth, with spines and with barbed stings; there were dragon-flies, snouted beetles and scorpions.

But—*what is coal?*

On the spot where the vast vegetation of the inconceivably remote carboniferous era flourished and decayed, we now find our beds of coal; to a depth of 10,000 feet, or nearly two miles, the coal beds or coal measures are in some places found to penetrate. Alternate seams of coal, of shale, of ironstone, of clay, and of rock, succeed each other through this great depth, in layers varying in thickness from a few inches to as many feet. For countless ages forests had their allotted growth, then a sudden submergence took place, and as the sea rushed in, a new feature in the landscape presented itself. On the then entombed vegetation, ridges of coral arose, forests of encrinites overlaid the forests of conifers, and produced in their turn beds of limestone, which again, deserted by the sea in its appointed time, afforded soil enough for trees whose rootlets required but little nourishment, and which flourished upon this new platform. These were again submerged when the sea rushed in, and corals and encrinites again set to work. How often these vast operations succeeded each other, and during what prolonged periods, there is no means of judging, except from the extended time which such growths must require. The world was old even then, and long anterior to these changes, unreckoned ages had gone by, producing formations of earlier date and longer process.

Thus we are brought to the close of the era denominated carboniferous—a period of gigantic vegetable growth, a period of ferns and conifers, a period of reptiles and fishes, a period having, like

that of all organic existences, recorded and unrecorded, a beginning and an end; a beginning how remote! an end—how distant! Myriads of ages must have elapsed ere these vestiges of creation could have formed—by their own successive growth, by their subsequent mergence, by the formation above them of beds of coral, beds of limestone, and beds of shale, and again by a later and fresher vegetation—that solid and enduring mass of fuel, which yet may last for ages to come. That our coal was formed from these vast accessions of cryptogams, conifers, and sigillaria, is now beyond a doubt; for intertwined and interlaced with the fabric of the coal we find the plants themselves, crushed and altered it is true, but still retaining a part of their form and beauty. It is a matter of history, recorded by the botanist, microscope in hand, that in some coal all is vegetable structure; and though it is beyond human power to effect the transition from vegetable to coal, yet is it not difficult to comprehend the change which has taken place.

What is coal in its general signification composed of? Carbon, hydrogen, oxygen, and a small proportion of saline ingredients. What is a piece of wood, or a pine, or a fern composed of? Carbon, hydrogen, oxygen, with water, and a small proportion of saline ingredients.

Thus, the transition from vegetable to coal appears to consist principally in the loss, in the former, of the water or juices which constitute the sap of the plant, and which when no longer living it requires no more. Borne down by the flood, buried under the coral reef, it slumbers through ages and ages under the continually increasing pressure, till its juices being exhausted, its membranes are united in one solid mass, and the gradual process of eremacausis has connected foliage, trunk, and roots, into one homogeneous body, undistinguishable to an ordinary observer from its brother shale, found both above and beneath it in the mine. The point at issue between the scientific arbiters of this question raises our interest and excites our curiosity to know more upon a subject so fraught with mysterious grandeur; and when the distinction between our shales and coals, and other formations of the carboniferous era are more clearly defined, there will still be eager inquiries with each succeeding generation: *What is coal?*

ONLY A PENNY.

WHEN a wag won his bet that he would cry a trayful of sovereigns on London Bridge, and not sell one, the price he fixed was a penny. "Only a penny, ladies and gentlemen! real sovereigns, full weight! buy, buy! only a penny!" Had he offered them for twopence, he would have sold the lot. Depend upon it, he gained his wager not only because the proposal seemed at first ludicrous, not to say improbable, but because the price he asked was so familiar that it did not arrest attention. Certainly those vagabond merchants who take the penny as the unit of our coinage live somehow; but who ever saw them complete a bargain? There is a man near the corner of Great Portland Street, Oxford Street, who offers little Jacks-in-the-box, which jump out with a spring and squeak, at only a penny. I have passed him, I may say without any exaggeration, hundreds of times; he is always nipping the spring of the box-toy, and starting the little image, then shutting him down again, and thus giving him an intermittent view of society throughout the day; but I never saw him sell one. His cry is very melancholy and monotonous, as if he were sentenced to the work. Children sometimes put a drag on their nurses or mammas as they pass, and point imploringly at the temptation; but the merchant never meets their efforts with a step forward, a responsive gesture, or a change of tone. "O-o-o-nly a penny!" then a squeak from the toy; but, I repeat, I never saw him sell one, though I always look to see. I wonder how the people in the shop opposite to which he plants himself can bear the sound of his trade. The man who blows a whistle in a little cup of water, thereby making general imitations of a singing-bird, might not be so wearisome—he is no worse than a canary—moreover, he is a pleasanter-looking party to deal with, glances cheerily at the public over his little tin mug, and occasionally exchanges the exhibition of his instrument for verbal persuasion.

It is curious to see the interest taken in those dealers who propose wonderful scouring-drops, and exemplify their quality on the collar of some promiscuous boy, who puts on while the operation proceeds just that uncertain face which might precede an electric shock. A little spot is cleansed in the collar—a little clear space like that which the skating-club sweep in the snow—the experiment succeeds unequivocally; the effect is, as was previously assured, instantaneous; but no one buys; not that no one need—it would take a bucket of the magic mixture to scour the group—but they disperse, gratified and dirty. What an apt emblem we have here of the reception which much excellent advice meets with. An offender is exhibited, theoretically, and the panacea is applied; what was foul becomes fair under the wonder-working tongue of the performer. Will no one possess himself of the corrective? Not he; he sees the rascal cleansed, and departs.

There is one article sold cheap in the streets in which I could never bring myself to believe the public can be suddenly interested, or feel a noon-day want for. I mean sponge. The seller here does not exhibit the detersive quality of his wares like the magic drop merchant, but he carries as many as possible in his hand till it looks like a swelled boxing glove. I once, however, saw a man on the point of buying a sponge at the Regent Circus.

The most successful of this class of traders are, perhaps, those who deal in pens. The merchant writes in a fine bold hand, at intervals; probably this is the secret of his business. That little boy who invests his penny is not the only one deceived by thinking the result is to be attributed to the pen instead of the hand which moves it. Poor little chap! your purchase will make nothing but blots in your uneducated fingers. However, the pen-seller acts like hundreds who appear to offer for sale what really cannot be sold—skill. Thus

Rarey gulled the public when he charged ten guineas a course for teaching what none but such as himself could do.

There are intermittent phases of this penny commerce, as any one may see who observes how on any public occasion the number of merchants is multiplied tenfold. During the cattle show in Baker Street, whole groves of penny sticks line the streets about Portman Square. I have several times thought it would be a safe investment to buy them all, and make cent. per cent. of one's money. I am sure I should be charged elsewhere fourpence—or threepence at least—for such batons as come into the market only then and there.

One passing penny speculation must be always a losing one. I mean in forms of prayer on the occasion of a day of national thanksgiving or humiliation. After service, at least, they are a drug. But the vendors begin quite early in the morning, increasing in importunity as the day passes; when the church bells strike up they grow more eager still, and thrust their wares upon the intending worshipper with desperate energy, like hawkers of playbills at the very door of the theatre. I fancy the theology of these extemporised penny merchants must be sometimes at fault; and a man might find out too late that his want of success in selling his wares to a string of supposed church-goers arose from his being deceived by the ecclesiastical outside of a building, which did not within recognise the authority of his Grace the Archbishop.

Imagine a poor costermonger who had tried in vain to force the productions of the Establishment on a congregation of unorthodox Dissenters, and sat down to his table that night loaded, not with supper but with stale forms of prayer!

By the way, talking of the suddenness with which small vendors can be found to undertake commercial exigencies, I cannot help stopping a minute to express my wonder at the promptitude with which links are produced in a fog. Every penniless urchin has a link. Did you ever see a link, except in use? Did you ever know of a shopkeeper who kept, exhibited, or advertised a link? Should you know where to buy one, if you were offered a thousand pounds for it, on condition of its being produced in a quarter of an hour? But let the fog be ever so sudden—let it be so thick as to make hurried visits to the link-warehouse, wherever it may be, impossible; yet the fact remains, mysterious—inexplicable;—you meet scores: perhaps, by some wise economy of nature, they come with the fog, and are to be picked up in the parks, like rocket-sticks, after an exhibition of fireworks.

Only a penny! but we may rise in the commercial circles, and notice how frequently this is the fixed price of nobler articles than whistles and bad pen-holders. Think of Rowland Hill. Only a penny! was a flash of inspiration to him, communicated not only to Britain, but to Europe—to the world. The penny postage immortalises the Victorian age of England. The success, however, of this bold stroke has made the inventor exacting—labouring to expedite the delivery of these stamped letters, he has deceived not only himself, but the public, by trying to make them sort their correspondence before it comes into the hands of her Majesty's servants. Those two mouths to the letter-box are an imposition. Mark the hesitating manner of that servant-girl with a bundle of letters in one hand, an umbrella in the other, as she tries to discharge her mission conscientiously, and yet run home before she has got wet through. She has an idea, poor honest thing, that if she makes a mistake about "Inland, Colonial, Foreign, and London and twelve miles round," she may possibly lose her place. I was stopped the other day by an undecided messenger who shrank from dropping the entrusted letter into the wrong box.

"Please, sir," said she, imploringly, "this is for Bury."

It was raining fast. I need scarcely add that I set her right.

Before leaving this feature of penny commerce, I must express my regret at not having invented the little holes round the stamps. Was ever anything so successfully provoking? Some idle fellow hit upon it, I 'll be bound, with his slippers on, sitting before the fire, when he ought to have been at work,—talking nonsense and pricking a bit of paper with a pin, and tearing it up. All at once the Goddess of Invention descends into his lazy brain, and he finds the mutilated scrap in his hand transformed into a cheque for nobody knows how many thousand pounds.

Perhaps the most irritating reflection connected with this discovery is that similar valuable wrinkles are still lying hid under your own eyes and nose. Depend upon it, my friend, there is some ridiculously obvious process even now floating about, like a butterfly, which will at last alight on the acquisitive bump of some lucky head. What is it? *It?* Nay, there is a whole flight of these enriching thoughts circling around that thick skull of yours, saving your presence. Can't you catch one? Can't you invent a shirt-button now, which won't come off in the washing, and so nip in the bud some series of recriminations which none but Sir Cresswell Cresswell can at last sum up, and save innumerable bachelors from precipitate wedlock.

A large family of steamers on the river held to the charge of two-pence for a long time—the penny boats raced, and were voted dangerous by old maids; but the mighty principle is asserting itself now, and the navigation laws above bridge are fast yielding to the penny. Omnibuses have yielded only in part, but if we are ever to have street-railroads, and are to be hauled along by steam from our breakfast-table to the Bank, the fare will be only a penny, you may be sure of that; the same price will then express the value of conveyance by land as well as by water all over the empire of London. As it is, parliamentary trains —which impress the stamp of our constitution on the railway system—are run at a penny a mile, this last phrase carries me into literature. The penny-a-liner. We fancy him in a seedy garret—like Hogarth's distressed poet—spinning out his sentences with vulgar verbiage, in order that he may make the wherewithal to boil his hungry pot.

But the fact is—— There, now, that will do.

We may, however, notice that most remarkable

feature of the literary world, penny papers. Here we may tread boldly—there is no question about their value ; only a penny ! with the programme of their contents printed on a limp sheet and kept steady on the ground by three or four stones, so that you can estimate the value of your pennyworth before you make up your mind to possess it. Besides the penny papers there is a marvellous issue of penny periodicals, with as much letterpress for your money as is contained in anything else, with the exception of advertisements.

The resuscitated order of shoeblacks too, adds another item to the catalogue of penny exchanges. I sometimes think those energetic little traders must keep a lump of paste-blacking in their mouths, as they produce so much of the polishing medium therefrom. I wish they would not point so perseveringly at one's boots when they are clean. To revert to an annual influx of country blood, I mean the visitors to the Baker Street Cattle Show, the shoeblacks go almost mad at the crowd of dirty highlows and bluchers which circulate about during that week. To them the sight must be quite as bewildering as the approach of unusually numerous shoals of herrings to the fisherman who has only one net—he cannot catch them all—they float by in provoking abundance.

Did you ever have your boots cleaned for a penny—the sensation at first is very curious. Blacky pounces on the foot, and brushes your trousers first, scratching off the bigger splashes with his nails ; it is like putting your toe in the way of a quarrelsome house-terrier, which makes ineffectual attempts to worry the intruder. The operation is always performed in a desperate hurry. Sometimes these brats add ingenious advertisements to their energy. I remember one who wore on his right foot a ragged, muddy old boot, while his left was covered with another which was neat, whole, and polished.

Only a penny ! I don't seem to have begun to think about it yet. I see penny tarts, buns, ices, rolls, trumpets, savings' banks, rules of prudential statistics, proverbs. I think of social economy and children's trinkets. The wealth of nations and the German bazaar — the inland revenue, penny gaffs, and the new coinage—the mind hurries on through crowds of thoughts all characterised by pence, and looks down vistas of reflection leading everywhere to the same coin, and ever returning the same answer to the inquirer, "Only a penny !"

We will take breath and linger for a minute by some of the objects which we are tempted to pass by so rapidly. Where shall we begin ? Let us go into that pastrycook's shop and look about us. Certainly we want a better class of refreshment rooms than those between a public-house and a confectioner's. It is expensive work to go into an inn, there is too the necessity of ordering this and that at a coffee-shop. Thus ladies and poor gentry, especially country cousins, keep the pastry-cook on his legs—for there you can get your bun for a penny, and lunch on copper. There is no need to order anything, no bill is presented as you leave the establishment. You may look about you without being interrupted by a waiter, you are not expected to sit down. Indeed, to tell the truth, I for one never felt any inclination to do so there, at least not since the elastic digestive days of school-boyhood. There is nothing hearty in a pastrycook's, nothing but sweets. Biscuits are not luscious, certainly, but they are dry, chippy food alone. A man, I imagine, who lived on nothing but biscuits, would before long get so full of flour as to make it fly about when he clapped his hands, like dust from pipeclayed gloves. The worst of the matter is, that the penny sweets are more or less perfumed, at least to my senses. Scent and taste ought not to be confounded. The nose and the mouth have their respective business to attend to ; and though clean sweets are a natural gratification to the nostril and palate, which no one need be ashamed of, one does not like to smell with the tongue. Who would drink rosewater ? Talking of the effect of sweets when applied to the wrong place, I remember once being summoned to a woman who had, so my informant said, poisoned herself in the porch. She lay on the ground, apparently in extremis, and muttered that she had taken oil of almonds ; there was an empty bottle by her side. I smelt it, it was not that ; so I handed her and the phial over to a couple of policemen, who in due time took her before a magistrate. It turned out that the poor creature had actually made an attempt on her own life, and for this purpose had asked for oil of almonds at a chemist's,—I think Bell's, in Oxford Street. He gave her almond oil, which had nearly the same effect ; at least she thought so, as she lay sick and frightened in the porch. Conceive the sensation of swallowing a whole bottle of scented hair oil, slowly, out of a phial. Faugh ! I confess I am reminded of this incident, however faintly, by some of the sensations at a pastrycook's.

Let us pass out, and follow that kindly aunt who has been stuffing those children ever so long with all manner of indiscreet penny abominations. They are going to the German Bazaar, where the stores of penny toys are to the occasional appearance of them in the streets, what the Arctic Regions are to the stray icebergs to be met with sometimes in the passage from England to America. Here a roaring trade in precious trumpery is driven throughout the holidays. There is nothing sold which will not break at once ; the object of the manufacturer is to produce frailty and elaborate pretentious weakness. However, on this account, they are most valuable, as toys, especially when given. They cost nothing ; excite gratitude and admiration, and then come to pieces before the possessor is satiated. But, methinks, the people who make these brittle fabrics must suffer morally. There is a saying sometimes heard from the lips of sly dishonest men, "Good work is bad for trade ;" but all these poor foreigners who stick these toys together must take it as the very principle of their business.

You never wish for a strong toy. It would make a child rough and impetuous, for he must break it at last, if it won't come apart kindly. So the German artist strives to excel in failure, and lives by imperfection ; but even with the intentional carelessness of his work, when you have to deduct the cost of carriage and profit made by the stall-keeper in London, it is wonderful how he

can produce such articles as at last are sold for—only a penny!

Only a penny! is not this the increment of all wealth; does not the wisdom of our ancestors in this commercial land say, "Take care of the pence, and the pounds will take care of themselves." Yes, it is the penny which both enriches and impoverishes. The merchant warehouses and banks are built with pence, the river and the docks are filled with them. Contempt for "only a penny" will beggar an heir of thousands, and has brought many to the court of bankruptcy or the poor house. This is the little leak which sucks away so mysteriously the ways and means in those households where there is never a spare shilling—where bills and wages are unpaid—though the income be never so good. Nobody can be in easy circumstances who despises the copper margin to his fortune. Let him look after that ring fence, and his estate will be safe; but treat that ill, let that get out of repair, and the poachers will soon have your gold and silver pheasants.

But if neglect of pence disorders the budget of the rich man, it beggars the poor. Small, careless, or selfish expenditure just marks the distinction between the respectable artisan and the pauper; small savings, on the other hand, eventually make the respectable artisan independent of impoverishing sickness, loss of work or even age. Penny banks are found to be the best forms of provident institutions; they do not deter the small depositor so much as even savings banks. These last have much of the furniture of a large establishment,—clerks looking at you through rails, managers chatting over an inner fire, huge books, and altogether a mysterious repelling air of wealth.

The boy or man who has made up his mind to save pence, and has found an old teapot on the mantelshelf but an insecure custodian, would not like to pass on to the savings bank at one stride. No, the humbler office close by, with an easy, sympathising, domestic air about it, which takes a penny, indeed adopts the very name of this coin, that is the house for him to keep his account at—the best stepping stone to the larger establishments. These Penny Banks are spreading, and promise to supply the want which was felt of some net sufficiently fine to catch the smaller fry of would-be depositors, and thus enourage the first movement towards self-help and independence. H. J.

STUDENT'S SONG.

Though we're deep in Titus Livius,
Or in Plato all the day,
Trust us, we are not oblivious
Of our maidens far away.

Though we bide in far-off places,
Working ever week by week,
We remember your dear faces,
Learning Latin, grinding Greek.

Living up in dismal attics,
Or in coziest first-floors—
Reading toughest mathematics,
Classics, science—horrid bores.

Turning leaves of dictionary,
Working hard as work we can,
We remember pretty Mary,
Lively Louie, gentle Anne.

Though we're deep in Titus Livius,
Or in Plato night and day,
Trust us, we are not oblivious
Of our maidens far away. F. V.

THE SILVER CORD.

BY SHIRLEY BROOKS.

CHAPTER LXXVII.

Henderson had doubtless expected that the announcement she had to make would produce its natural effect upon Mrs. Lygon. For terror, for bewilderment, and for their commonplace manifestation, the messenger had been prepared, nay, had even had a moment to think of the equally commonplace means of calming another woman's sudden agitation. But when the girl's message was fully delivered, and Mrs. Lygon, after her first astonishment, had comprehended the situation of affairs, her excitement took a form which baffled the understanding of her companion. With lips and cheek pale as ashes, Mrs. Lygon resumed the seat from which she had sprung, and gazed steadily upon Henderson.

"This must not be," said Mrs. Lygon, after a pause. "It must be prevented."

Henderson could utter only a meaningless exclamation.

"You must come with me to the police," Mrs. Lygon continued. "Yes, that is the only way. Women can do nothing. Come with me."

And she hastily sought for hat and scarf.

"All the police in the world would be too late, m'm," exclaimed Henderson.

"Why do you say so?"

"They are in the house together—they were in the house together before I came away."

"It may not be too late. I will go. It must not be, it shall not be," she added, to herself rather than to Henderson, and descended the stair. "He dares not meet Robert Urquhart, unless—. We must walk faster, Mary," Mrs. Lygon said, impatiently, as they came into the road.

"But I have something more to say, m'm, if you will let me," said Henderson, keeping pace with the rapid step of Mrs. Lygon.

"When we have seen the police," said Laura, hastening in the direction of the house where Adair had been conveyed after the affray at Silvain's, and whence Robert Urquhart had come, with the fatal knowledge that he had used so terribly.

"We shall only lose time, m'm," said Henderson, despairingly, "but it is no matter. If we hurried to the avenue ourselves—"

"I must not," said Mrs. Lygon, in a low voice. "But the police-station is in the way there," she

added, increasing her pace. "O, this is dreadful. But he *dares* not die thus."

And they hurried on together.

CHAPTER LXXVIII.

"*Formerly Allingham,*" was very neatly written under the name engraved upon the card brought in to Mrs. Hawkesley.

She had availed herself of Bertha's having fallen asleep, and had come down to the study to hurry off a few lines to her husband.

"Mr. Berry—certainly, yes. Here. And be sure to let me know the moment I am wanted."

"It is many years since I saw you, my dear lady," said Mr. Berry, "and I suppose that you will hardly remember me. Yet I think I should recognise something of the expression of the young lady who came to me two or three times about some alterations in her papa's house—something which I had to obtain leave for him to do."

"That must have been my sister Laura," said Mrs. Hawkesley. "There were no alterations in my time: we were not rich enough then to make improvements," she added, with her customary *naïveté*.

"Was it so?" returned the old gentleman, smiling for a moment, but immediately becoming grave again. "My eyes and my memory alike warn me that my work is nearly over. Can you spare me a few minutes for a little conversation?"

"Certainly," replied Mrs. Hawkesley. "But have you come up from Lipthwaite? Let me offer you—"

Her hand was on the bell, but he stopped her, with the apologetic courtesy of what is called the old school, which means the school whose teaching included the lesson that though women, of course, are created to serve us, it is as well to make their servitude appear voluntary.

"I am staying in town," he said, "and have recently breakfasted. At all events, let me say what I have to say at once. Mr. Hawkesley is in Paris."

"You know that! You have no bad news for me! He is not ill?"

"No, no, certainly not, my dear lady. I was merely about to say that I know he is in Paris, and why."

"Thank God. This is very foolish, but I have been under a great deal of excitement lately, and have not had much sleep. Do not suppose that I am a victim to nerves," added Mrs. Hawkesley, smiling, but perceptibly relieved.

"I ought to beg pardon for my abruptness. But at my time of life, when one has something to say, one is too apt to make haste to say it. I should have been more careful in my old professional days, when you were one of the ornaments of Lipthwaite."

"I will not hear that, after you have shown that you have quite forgotten me, Mr. Berry. Is it business that you came about—I mean that it is a pity Charles is away."

"You had a visit, some time ago, from Mrs. Berry?" said he, without more direct reply to her inquiry.

"Yes, and I ought to have asked at once after her."

"Forgive me, but I am aware of the nature of the interview you had, and that it was not likely to create any great friendliness of feeling. I am sure that you will, however, allow me to speak openly to you, and will not think that I have come needlessly to renew a painful discussion."

"Such of us as have known you, Mr. Berry, know you too well to believe anything that you would not like believed."

"Mrs. Berry is exceedingly, I fear dangerously ill, and under other circumstances I should not be in London. But I have a duty to do, and I am obliged to take the most direct means of doing it, in order to be able to return to Lipthwaite at the earliest moment. Your husband and Mr. Lygon being both absent from England, I am compelled to see you, Mrs. Hawkesley, upon the subject in question, and you will I know forgive me."

"Mrs. Berry is so ill—?"

"Yes. But for her illness it would have been her own place to make certain explanations which are due, but this is entirely out of the question, unless those whom she ought to see could be summoned to Lipthwaite. Therefore, however painful it may be to me to be the medium of communication, and to you to receive it, we have no choice, and I am sure that you will hear me with all womanly forbearance."

"Pray speak freely, Mr. Berry, and be sure that I know you mean kindly."

"At all events, I mean justly. You are aware, Mrs. Hawkesley, that when your brother-in-law suddenly found himself placed in the most painful of circumstances, he came to consult me, as his oldest friend, and that acting upon impressions which he received in my house, he left England for France, placing his daughter under our charge during his absence. The little one, weary of the restraint of our quiet house—"

"Let me say a word for my little niece, Mr. Berry. Not weary of a quiet house, but unable to bear the continued stream of false and cruel things which she had to hear about her mother."

The old man's face assumed an expression of humiliation which it was painful to see upon his kindly features, and Mrs. Hawkesley hastened to add,

"But things which she never heard from *you*, Mr. Berry, as she has told me over and over again."

"No matter," said Mr. Berry. "Perhaps there has been no time to tell me everything, but no matter. I did not know—"

And his eyes dimmed, and his lips trembled for a moment or two. Then he said,

"I am glad that the little girl has not much to say against me."

"She loves you heartily, Mr. Berry, and she shall tell you so herself before you go out of the house."

"Let me go on," he said, with a sad smile. "It is necessary that I should recall one or two things which you may never have heard, or having heard then, were not interested enough to recollect them. And remember, it is only as matter of duty, and at the special desire of her

who is now unable to act for herself, that I enter into such details. You understand this?"

"I do indeed, dear Mr. Berry."

"To a wife who is upon a wife's terms with a husband, to a wife who is his best friend, and who cares for no friend on earth in comparison with him, to a wife, in fact, who loves her husband, it may seem strange for me to talk of restricted confidence and of questions avoided by mutual consent. But it happens, and that is all that need be said on the matter, that my marriage with Miss Wagstaffe was a union of esteem to a certain extent, and of convenience, perhaps, to a still greater extent, and even before our wedding it was quite well understood between us that what is called love was out of the question. I was not foolish enough, at my age, to suppose that her heart had anything to do with her consent to marry me, or that she had not previously seen more than one person whom she would not sooner have married than the middle aged, quiet, well-to-do country lawyer. But this is the history of many a match that has turned out very well, so far as the world knows, and I am not going to say that either of us acted unwisely."

Mrs. Hawkesley listened quietly, and made no sign of dissent from doctrines against which, under other circumstances, she would have protested according to her custom. Perhaps she had in her mind another marriage in which a similar element had worked to the destruction of happiness.

"It pleased God that our children should not live."

"Ah!"

"Yes, I understand that pity, but it is misplaced. I thank God that our children did not live."

"Mr. Berry!" exclaimed Beatrice, with a mother's unfeigned horror.

"They are sad words, are they not?"

"I would call them wicked words if I were not speaking to one who might be my own father," she answered, energetically.

"They are not, but let them pass."

Be it said that she continued to listen, but that the kindliness of feeling with which she had begun to regard Mr. Berry was chilled by his strange language on a subject on which her heart would tolerate no profanity.

"I repeat," he said, "that I am thankful to be childless. When an old man tells that to a young mother, let her think well before she condemns him—let her think what she would have to feel and to suffer before words like those could come from her lips. And then let her listen to him with patience."

Beatrice looked pityingly at him, but did not answer.

"I have no long story to tell you, Mrs. Hawkesley, my business being only to help in an act of justice. I am not here to enter upon revelations of a life that might have been cheerful, if not happy, but which was incessantly embittered by the abiding pressure of a conviction, not only that I was not loved—I had bargained for that—but that I was disliked. I was not long in discovering that my wife's old thoughts and old loves came perpetually between me and herself, that at the best I was tolerated, but that at the times when she gave way to her rapidly increasing irritability and melancholy, I was almost the object of her hate. Whether I bore this conviction well or ill is between me and Heaven; whether I remembered that though I had given this wife much which the world esteems, I could not be to her that which woman covets amid all the advantages of life; whether I gladly recognised any of her few kindnesses, and bore in silent patience with her habitual coldness and repugnance, let her say when she has to answer for all. It is enough for me that I can reveal this part of my history to you, and feel I have no excuses to make for myself,—no self-accusation to tender as excuse for her."

"You do not mean to ask that I shall judge—" began Mrs. Hawkesley, in a troubled voice.

"I have only to ask you to hear, and I will make what you have to hear as brief as I can. I pass over the years spent in this manner. The world thought that the rich lawyer had married a rather strangely-tempered woman, but supposed that they got on as many other couples do, and will do to the end of the chapter. And so the world might have continued to think, for what I had borne so long, I might have borne to the last, but it was not to be so. I need not dwell upon the circumstances which, some few years back, directed the mind of Mrs. Berry into what is termed religion. Enough to say that she devoted herself to its external pursuits with an ardour that was strange to those who had known her slightly, detestable to me, who had my own insight into her character. I will only tell you that the real influences of religion never approached her heart and never softened her nature—never caused her to shed a tear of penitence, or to show any womanly gentleness to the husband who had sought to fulfil his duty. You look at me as if I were drawing too harsh a picture—as if this was not language in which I ought to speak of my own wife—"

"It is very painful language."

"It is the language which I am sent here to speak. It is what Marion Berry herself ought to say, were she here, making her confession. I will soon relieve you of your care for her, for the story now connects itself with your own family—with your own sister. I told you just now that what I had borne so long I could have borne to the end. It was destined that I should have more to bear. Your sister, Mrs. Lygon, left her husband's roof, and among the consequences that followed were revelations which I little expected would disturb the later hours of my life."

"Of yours?"

"Yes. Do not apprehend a scene, or that a man of my years is about to give way to what would befit a man of Lygon's. I am here as the messenger from a sick bed which may have been changed to a dying bed before I return to my home. I am here to say, for one who cannot say it for herself, that when Marion Berry was in this house she uttered much which was intended to make you and your husband believe that your sister Laura was unworthy, and that now, stretched upon her bed, Marion Berry begs you

to believe, on the word of one who may never rise again, that she spoke falsely. That is a fitting message for a husband to bring from his wife!"

"Did she ever say to you," asked Mrs. Hawkesley, in a low voice, though her eyes were shining with excitement, "that either Charles or myself believed one word of her tale?"

"Your husband believed it, in spite of his affected indignation with her,—so run my instructions," said the old man.

"He did not," replied Beatrice, "and it is needless to say that I knew it to be false. It is right that the retractation should be made, but it is utterly unnecessary."

"This, of course, I expected to hear. Yet you will do well not to throw away a single link in the chain of evidence that is required to establish the innocence of your sister."

"We want no evidence, Mr. Berry, and I wish that she were here, that you might see how much credence we have given to the wicked slanders that have been spoken against her."

"You speak well, and nobly, dear lady," said Mr. Berry, looking at her animated face with some admiration; "but what says Mrs. Lygon's husband?"

"By this time, I trust, he has told Laura herself that he never really doubted her."

"You picture her in his arms, and all forgiven?"

"God is just, and it surely will be so."

"Ay, He is just; but not with such justice as we measure out. Do not deceive yourself. I should not have come here to assure you of that which you believed without me, unless I had more to tell you. You imagine that Arthur Lygon has forgiven his wife. How, then, do you suppose that she has answered the one question which must have gone before forgiveness?"

"What question?"

"The first that must spring to the lips of a husband, abandoned by his wife. Why did she fly to France?"

"Bertha is in this house, and has told me," said Mrs. Hawkesley, calmly.

"Mrs. Urquhart? She is here!"

"She is here."

"Tell me, Mrs. Hawkesley," said the old man, in much agitation, "tell me, for Heaven's sake, and in a word—you know that I ask only for the good and happiness of you all—Mrs. Urquhart is here—but—but—let me speak plainly—*she* has not persuaded you that she is innocent?"

"My husband brought her here," said Beatrice, with dignity.

"You evade my question, or it is as I suspect, and Laura is made the sacrifice," exclaimed Mr. Berry, eagerly.

"It is not so," said Mrs. Hawkesley, moved by his evident sympathy with Laura. "We will not speak of Bertha."

"Ah, so far I am answered."

"And she has declared that Arthur has nothing to forgive."

"Nothing to forgive—is she mad? Will she say that to Arthur Lygon when he demands why his wife went away, and hid herself from him, and sent him no word of explanation, or petition, or apology. Nothing to forgive!"

"I have said enough," replied Mrs. Hawkesley, quietly. "The rest will be set right in Paris, and I shall hear that it has been set right."

"You are one of the best of women, I see that," said the old man, so earnestly that the strangeness of the speech was lost in the sincerity of the speaker. "But here is nothing but misery in store, unless we clear up the mystery, and you will not hear me, or be convinced that there is anything to be done. Do you not know that Mrs. Lygon is accused, on solemn evidence, of being that which you will not believe her?"

"Yes," answered Mrs. Hawkesley, promptly, "and her husband and mine are gone over to tear that evidence to pieces."

"And will that destroy its effects?"

"I do not understand."

"Will tearing up those papers cancel the testimony they bore?"

"Ah! you take up my words literally—I meant that Charles and Mr. Lygon would disprove all."

"And that is what they cannot do."

"Cannot?"

"Without the aid which I have come to bring. It is this which has hurried me up to town from the house in which a woman, who bears my name, is lying, probably on a death-bed, and it is this which you must accept, or all that may be attempted in Paris will be worse than failure—worse, for if the breach be not now closed, it will be so widened that it will close no more until the judgment."

"What do you come to tell me?" asked Beatrice, partaking his agitation.

"Do you know the evidence against your sister?"

"There are some letters, I am told. There is a book of letters, and it is a wicked lie to say that she wrote a word of them."

"*It is not.*"

Mrs. Hawkesley looked at him with indignation for a moment, but his face expressed so much unfeigned sorrow, and was so utterly divested of anything like the triumph which a vulgar nature permits to be visible when an apparent advantage has been gained, even in a sad discussion, that she was almost disarmed. Yet she could not help replying,

"Mr. Berry, you have the kindest meaning, and I should be ashamed to answer you with a word of unkindness. But you have told me that you come only as a messenger, and there is no offence to you in my saying that you bring a false message. This is another malignant effort made by one who, if she is so prostrated as you say, should be repentant, and not give you falsehoods to bring us, and try to create fresh wretchedness."

"It is natural—very natural, that you should say this," said the old man, quietly. "I have heard enough, and far more than enough, to make me well aware that you must hate her who has sent me here to-day. But do not blind yourself, even with a natural passion. You have heard the truth from me."

"I am writing to my husband. I will write

down what you have just said. He will believe it no more than I do; but you will wish him to hear it?"

"He must do much more than that," said Mr. Berry, "and I beg that you will not be rash. I am an old man, and I assure you, with all the sincerity of one who has nothing to hope or fear in this world, that unless you are guided in this business, you, or your husband, will destroy for ever the chance of re-uniting Laura and her husband. Do you believe that she was justified in leaving him?"

"I believe that she will justify herself to him."

"You do not—you cannot. You are deceiving yourself between hope and love. But what earthly excuse have you devised for a virtuous wife and mother who rushes away from a happy home? What excuse, if you yourself should commit such an act of madness, would you hold to justify you?"

"This is for Arthur, not for me to decide," replied Beatrice.

"Nay, nay, you have no solution of the mystery. Do you not know that when Mrs. Lygon left, Arthur hurried down to me, and that it was this very question which exhausted our best energies, and left us without a clue or guide? Has the case mended by her long absence, since then? Yet you will not see this, and will not hear that there is indeed evidence against her."

"Mr. Berry," said Mrs. Hawkesley, "I know that you will acquit me of intending offence, but I cannot help answering that everything that comes from—from Lipthwaite—"

"From Mrs. Berry."

"That *is* my meaning; and I regret that everything from that quarter is so tainted with the poison of her wicked hatred that I refuse to have anything to do with such suggestions. I will not say that you are influenced by her—"

"Yes, say it, if you think it. An old man, married to a younger woman, and one of an artful and resolute nature, has been deluded into believing whatever her malice may have dictated. It is true that he has humiliated himself by describing his own sorrow and misery, but that may be only part of the fraud, and may have been enjoined upon him by his wife, in order to give a better colour to the story."

"You are putting words into my mouth—"

"But not thoughts into your mind. I have but said what has been passing through it. No matter. I love Arthur Lygon as if he had been my own son, and I will shrink at nothing that can help to restore to him his happiness. You, convinced of the innocence of your sister, refuse to assist me, because you disbelieve that I am speaking the truth. I had hoped to convince you without other words, but it shall be done."

"Mr. Berry—"

"You must listen to me now, and if hereafter you think of this interview, and I trust that it may be one to which you will look back with gratitude in other respects, you will remember that you forced an old man to his last resource—to a confession which man should not make to woman—before you would consent to be useful to your sister."

"You speak very unkindly."

"We are all unkind—so be it. Mrs. Hawkesley, if those letters which have established in the mind of Mr. Urquhart the conviction which he has now imparted to Mr. Lygon and to Mr. Hawkesley—you look incredulous, but it is so—if those accursed letters, I say, are destroyed in France, Laura Lygon and her husband had better formally part for ever, for they will never again be husband and wife."

"Will you tell me why you say so?"

"Because Arthur Lygon will never be able to efface from his mind the conviction that, though that miscreant, Ernest Adair, has chosen to repudiate the letters, he has done so from base reasons, and that the truth was really set before Mr. Urquhart."

"Base reasons," repeated Mrs. Hawkesley.

"That he has been bribed to declare the letters to be forgeries."

"And who should bribe him?"

"Mrs. Lygon, or her friends, specially your husband. There, now your eye flashes, and your cheek reddens, but be calm. I am speaking for Mrs. Lygon, you are struggling against her interests. You think that Arthur Lygon will dare to entertain no such dastardly idea—even if he should cling to a suspicion that may affect his own wife—will he venture to suspect your own honourable husband? He would do ill—he would wrong a man worthy a wife like yourself, but, Mrs. Hawkesley, he will do it. You know not, and never may you know, the self-communings that pass between man and his soul at hours when both should be at rest. You know nothing of the spectres that rise in the cool dawn, when a man awakens, with his body helpless from the languor of the night, but his mind feverishly vigorous to snatch and cherish all foul and bitter thoughts. That is the time when, with his brow within the breath of his slumbering wife, Arthur Lygon will lie and weave his stubborn doubts into a damnable faith, and will scowl down upon her while she is dreaming of him and of her children."

"I cannot answer you," said Mrs. Hawkesley, nearly crying. "If such evil thoughts are allowed to haunt us—"

"We know where to go for the exorcism. Yes, but Arthur Lygon has never learned that lesson. Make this hollow peace if you can, destroy those letters, and on some still morning Lygon will rise up from the side of his sleeping wife, and steal from the room—and she will see him no more."

"What would you have me do?"

"First, be convinced yourself, or you will convince no one else. And now hear me. It was with no good will that Mrs. Berry sent me on the message I have come to deliver."

"I am sure of that."

"The retractation of what was said here was her own voluntary act, for she believes that she is dying, and I know not what idea of reparation and of salvation may have instigated her, but the message was given, and were that all, I should have written it, not charged myself with the delivery of aught so painful. But when I tell you that we must have those letters in England, I tell you what was wrung from the abject terror of a proud woman, who yielded to a threat more

fearful to her than anything which her minister could tell her of flames and tortures."

"I do not wish to hear of this," said Beatrice.

"But it is necessary that you should, or you will not act. Do not think that I am speaking for the sake of Mrs. Lygon, or any of you save one person, and that is Arthur Lygon, whom I will save from misery if I can. Remember that, even when I reveal to you that I, Edward Allingham Berry, master of a secret that I had kept for years, menaced my wife with its disclosure, unless she, in her turn, gave up to me the secret of those letters—"

"And she gave it?" asked Mrs. Hawkesley, almost trembling.

"Ask its price," said the old man.

"That does not—that is not for me to know, but tell me of the letters."

"No, I will first tell you how you may be sure that I bring you the truth about them."

He leaned forward, and in a low voice, but without looking at her, uttered a few words.

Beatrice's face and brow crimsoned, and she turned from him.

"You are writing to your husband," he said. "You need say nothing of that which I have just said to you, but tell him that the truth has been bought at a great price, and bid him bring those letters to England. I think that you will do so—I think that he will obey. If not, your sister's misery be upon the heads of both of you. It is not likely that we shall ever meet any more in this world, Mrs. Hawkesley, nor is it fit that we should. But if you do your duty in this matter as I have done mine, the old man forgives you for having forced him to say what he has said in this room. That is for little Clara," he added, throwing an envelope on the table. "Farewell, Mrs. Hawkesley. It rests with you to save your sister!"

CHAPTER LXXIX.

Ernest Adair, unconscious that he was watched, crossed the sill of the window that looked upon the garden of the house, formerly Mr. Urquhart's, and stood in the little room at the back of the apartment in which the engineer kept his models and other lumber. It will be remembered as the chamber in which Mrs. Lygon had been secreted by Bertha and by Henderson, and into which Urquhart had forced his way, unaware that an unbidden guest was concealed behind it. The door, which had yielded to the strength of Robert Urquhart, had never been repaired, and the state of its locks and bolts gave evidence to the terrible strength that had wrenched it open. It was thrown back upon its hinges, and this was an advantage to Adair, for the room into which he had entered was somewhat gloomy with the shade of the approaching evening, and some helpful light streamed across the dusty lumber-chamber.

For the rest, the apartment looked as melancholy as a room which has been occupied by women, and forsaken by them, ever looks. A man's relics, his book, his wasted paper, his discarded pen, and the prosaic litter of his abandoned cave, inspire little sentiment; but the scrap of woman's work, the trace of woman's idle business, the forgotten ribbon, the dropped embroidery, speak of gracious and playful companionship, of the light laugh and the merry glance, and speak of them as of things that have wronged us by departing. And some of these signs had been left in the chamber into which Ernest strode, across the window-sill. He had a glance for them, but not much sympathy.

"I am strangely nervous," he said, "and yet I have been careful enough as to drinking and all that. The slight exertion of forcing that shutter and lifting the window has made my hand tremble. Is it an omen? I doubt whether I could write a neat despatch. I must take more exercise—this sort of thing will not do."

While he spoke he drew away a table that stood near the door of a closet on one side of the room. The door itself, with its panel to match the woodwork, would almost have escaped notice, except that it had given a little, and a dingy-looking crack marked its upper line. It had no handle, but a piece of faded tape, sent through a hole where a lock had once been, answered the purpose, or rather had answered it for the last time, for Adair, pulling vigorously at the frail string, broke it off short.

"Omen number two," said Adair, smiling at his own folly. "My hand is in a tremble, and the door refuses to open to me. But we defy auguries."

He wrenched this door open with a piece of iron that had flown from the other when Urquhart broke into the room.

The closet, or cupboard as it had once been, presented a display of rubbish which had been cast in to be out of the way, rather than for preservation. A box or two, bundles of old papers, dusty folios, and some other engineers' room relics, were the principal articles disclosed as the door came reluctantly open.

From the lower part of the closet Adair pulled away the litter that concealed the floor, and then stepped back to allow the dust to subside. Then he threw down a tolerably clean piece of newspaper which he found at hand, and was about to kneel upon it before the closet.

"Stop, though," he said, "that infernal French ink comes off."

As he spoke, he took up the piece of paper, and his eye accidentally fell upon the date, which happened to be on the fragment.

"Why," he said, with an oath, "that is a paper of this last week!"

He looked at it again, as if expecting to find that it was a year old. But no, the date was there before his eyes, and the paper, torn and dirty, was not a week old.

"How the devil could that have come?" said Adair. "Omen number three," passed across his mind, but the business just then was too heavy for scoffing, and it was with a hot flush that he fell upon his knees, and lifted up a sort of flap that lay at the bottom of the closet, a small trap-door that opened into a cavity of some little depth. As he pushed open this trap, and was about to plunge his arm into the cavity below, he heard a footstep on the garden gravel, and the next instant the shutter which he had opened on making his way into the house was closed.

It was not by the wind. A strong hand drove it close home, and struck it to make all sure.

Ernest Adair sprang to his feet, and his heart beat with terrible quickness—in the stillness of the chamber he could hear the throb. Another moment, and he dashed his hand across his eyes with an impatient gesture, and listened intently.

He heard, or thought he heard, the sound of retreating feet, and a word, or rather a growl, signifying that some order was understood. Then, Ernest laid his hand for a moment upon his heart, but with the danger had come the courage, and it was not to count the beatings that he placed his hand there.

Next, and unmistakably, he heard a key in the lock of the front door. He darted to the door of the apartment in which he stood, nearly closed it, and, holding it with a firm hand, listened.

(To be continued.)

REPRESENTATIVE MEN.

PROGRESSIVE STATESMEN.

CANNING: HUSKISSON: PEEL.

IT is a curious thing at this time of day to have one's memory directed back to the period when we were struggling with confused ideas about what sort of men should govern us. Very confused our ideas were as to the proper quality of Ministers of State. From school lessons on history we brought notions of the peril of rule by the minions of Courts, of whom old-fashioned histories have so much to tell. We thought nothing could be so dangerous as a low-born favourite, undertaking all sorts of political offices, and setting his poor relations to govern the people. Then, again, we read and heard a good deal of the evil of aristocratic assumption in the sphere of political action. Great old families, or great families who were not old, or venerable in their origin, had a way which should be well watched of taking for granted that they were to govern the country, without any question of their fitness to do so. The time was just coming in when some new question occasionally arose which aristocratic statesmen were ignorant of, and which might apparently have been better managed by some clever and well-informed middle-class man who understood it in its true bearings; and then we asked one another why we never had that sort of minister. Those were the days when Lord Eldon would boast in the same hour that England was a country in which "every man"—not merely any but every man—might raise himself from the lowest origin to the highest offices in the State—avowing himself a proof of the fact—and yet that the British Constitution was the best in the world because it kept out low people from meddling with State affairs, and gave all substantial power to the *élite* of the nation. The confusion in Lord Eldon's mind was a type of that in the general mind. I have known the most opposite moods and views held on successive days by the same persons at that period. A reformer whom Lord Eldon would have called revolutionary for a speech about Old Sarum, might be heard grumbling in Westminster Abbey at the admittance of a monument to Watt among the Edwards and the Henrys. One of the commonest forms of the confusion was ill-usage of Mr. Canning and Mr. Huskisson as "political adventurers," almost in the same breath with complaints that the country was governed by men who could have no knowledge of popular needs and interests.

That Mr. Canning and Mr. Huskisson were in the Government in defiance of slights and of talk about their being political adventurers, showed to those who could read the signs of the times that a period of political progression had set in. There were other people besides Lord Eldon who were spending their lives in trying to hold back society, at least, if they could not move it back. Metternich was three years younger than Canning and Huskisson. They were born on the 11th of March and the 11th of April, 1770, and Metternich in 1773. We have seen, in an earlier retrospect,* what became of Metternich's passion for standing still when it was not possible to go back. We will now glance at the state of affairs which arose from our having statesmen who were able to see that they must move on.

It might be, and it was, alleged that there was much nonsense in the cry about these men being political adventurers. If they had not independent fortune, no more had Pitt, who was living on less than 300*l*. a-year when he first became a minister, and who had made preparations for resuming his career at the bar when, at seven-and-twenty, he expected to go out of office. But he was the son of a minister. A minister might get into office either by hereditary propriety, or by great claims of birth or fortune; but Canning and Huskisson had neither the one sort of qualification nor the other. If ability was suggested as a third resource, there was a good deal of hesitation about admitting it, because, if free access to the seats of power was allowed to sheer ability, there was no saying what changes might not follow. A set of low people from the regions of trade and manufactures might seat themselves in places hitherto regarded as reserved for the aristocracy of the country. It was too late for practical objection, however. There they were—Mr. Canning and his friend; and they were there because there was work to be done for which they were the right men.

George Canning's lot was that of the orphan. His father, who was of a good old provincial family, died when the child was only a year old; and his mother's position was not equally good: so that there was some colour for the talk of his being of low origin. Mr. Huskisson's father was a farmer of fair landed estate. Neither of them had any tendency to political fortune-hunting. Canning was educated for the bar; and it is said to have been Sheridan who persuaded him to leave it for politics; and Huskisson's connections, tastes, and habits of business fitted him so precisely for filling posts of public business which were financial or administrative, if not political, that his vocation seemed as natural as that of any member of any of the professions.

When he was only twenty, he had a considerable name in Paris for his opposition to the great paper-money scheme of the day. He was in Paris through his uncle being physician to the embassy there. He was invited to be the ambassador's secretary; and when he returned with the embassy to England in 1792, he was at once thrown among

* See ONCE A WEEK, vol. ii. p. 211.

the leading political men of the day. He saw Pitt and Dundas frequently; and the latter asked him to undertake a small but very troublesome office,—that of investigating the claims of French emigrants, then crowding into England. His talents for business at once became so evident that henceforth he was in his right place only when he was in office. He was not a man whom the most suspicious critic could ever imagine to be intriguing for power. He had a passion for economical questions, and a hearty liking for the dispatch of business, while to questions of foreign and party politics he brought only half a heart. He did not manage his political relations very well, in truth. His attachment to his friend Canning guided him well through the critical points of Canning's career. He resigned with him, kept out of office with him, and acted consistently with him during Canning's life; but, after his death, the devoted public servant and private friend damaged his own reputation through his tendency to be absorbed by the practical business of his office, to the neglect of nice points of political observance which are all important to the eyes of political leaders. Mr. Huskisson wanted to have trade disincumbered of the protective system, and to get the business of the Woods and Forests, or of the Colonies, carried through without interruption; and changes of ministry were annoying and perplexing to him, as interrupting the nation's business. He showed that he could sit with very various administrations; and people said this was what might be expected of a political adventurer. He was unconcealably disappointed when the Duke of Wellington took him up short about resigning in 1828, and compelled him to do it: and again there was the same sneering comment; but it was the very devotedness of the man which got him into these scrapes. He was as timid about responsibility, and modest about his own consequence, as he was bold in his political economy and "impracticable" with all triflers about the business of the country. He hesitated too much about troubling the nation with personal difficulties; and he could not make anybody understand what the risk would be of giving over his free-trade schemes into other hands than his own.

His latter years were thus not his best, in regard to political position: but a future generation was sure to make up for everything by understanding the magnitude and weight of his enterprises, and clearly perceiving that such a man as himself, drawn from his rank in life, and furnished with the knowledge which belongs to that rank, was wanted for the great work of liberating the commerce, and reforming the fiscal principles of his country.

That a middle-class man was wanted for the special work appears also from the fact that Mr. Huskisson was himself in a progressive state, as well as the guide of the nation in a forward course. Long after he had perceived that a protective policy was an injury to all the parties that lived under it, he sustained the highest duties on corn that were proposed from any quarter. He believed that while any manufacture or department of commerce was protected, there must be stringent corn-laws to prevent the price of wheat falling below 80*s*. This was at the time of the peace: and it took him a dozen years more to satisfy himself that the price of corn depends on so many elements that to fix a legislative price is only to increase the risk and confusion. In 1821, he had got so far as to advocate, in a Report on the Condition of Agriculture, a reduction of the corn duties: and from that time forward he had the whole landed interest of the country for his enemies.

In another year or two there seemed to be scarcely anybody left on his side, beyond his personal friends. The silk and woollen manufacturers regarded him as a man with a head full of crochets and without a heart in his breast. He felt his evil reputation very painfully; and his emotions gave a higher quality to his speeches on free trade topics than appeared in any other part of his oratory. He made his subject so plain that he always converted somebody; and there were occasions when he converted almost everybody for the moment. In inland towns, the merchant or manufacturer would tell his wife at dinner, or his partner in the counting-house, that here was another speech of Huskisson's,—more puzzling than ever. It seemed, in the reading, to be as plain and incontestable as any sum in Cocker; yet scarcely anybody but Huskisson himself believed a word of it. This was only for a time, however. Bit by bit he won a little freedom for trade,—got the Combination-laws relaxed,—and obtained some scope for the exportation of machinery. Timid as he was about some kinds of responsibility, he had no fears of the consequences of relaxing prohibitory and protective duties; and he stood calm and confident when hon. members shook their fists in his face, and called him the destroyer of their constituents, and the malignant foe of the landed interest. He had the pleasure of pointing out, before he died, the happy results of his policy, as far as it had had room to work; and he felt the comfort of gaining over more supporters from year to year. He was sustained by some of the best newspapers, of both parties in politics; and he ventured to tell his friends that he held a whole handful of free-trade, and had as yet only opened his little finger. He was quite unaware that his entire handful was only a sample, in comparison with the freedom which would be given within thirty years of his death. It was with deep satisfaction that he learned, in the last spring of his life, that there had been an exportation of silk goods from Bristol, and that the Macclesfield manufacturers now admitted him to have been the best friend to their industry. What would he have said if it had been foretold to him that in thirty years precisely from that time. the last penny of protective duty would be removed from our financial schedule; and that parliament would have ceased to be importuned with complaints of agricultural distress, because agricultural improvement would have placed the landed interest almost beyond the accidents of fortune, while free-trade in food would have released the nation from all fear of famine! Such a prospect would have amazed him almost as much as his enemies. He had not learned everything in his own line: but he was a progressive statesman in a day when to be that was to be unpopular with high and low.

Of his various offices his Presidentship of the Board of Trade is the one which will be remembered as his proper seat. As he sat there, with his thoughtful face, and his prominent eyes, shrewd and gentle at once, and his business-like manners, he was in fact the master and the servant of a new generation and of many nations, —the teacher and the helper by whom British industry has been made free, and colonial wealth and security have sprung up with magical speed; and even France and other countries are letting go their corn-laws and other burdens, and allowing themselves a fair chance in the race of industry.

On the 18th of July, 1827, the two friends bade each other good-bye for the recess, after the stormy session they had had to pass through, on Mr. Canning's accession to the Premiership. For him there was little prospect of holiday; but Huskisson was going abroad. He went up to Canning's bedside; and he observed that his friend seemed to need the trip the most of the two: but Canning replied that it was only the reflection from the yellow bed-curtains that made him look ill. This was their last meeting. The Huskissons turned homewards from Switzerland on hearing of Canning's serious illness: and on the road they heard of his death. Mr. Huskisson believed his own political career to be closed. He no doubt lamented afterwards that he allowed himself to be over-persuaded by the King and Lord Goderich to take office among Canning's enemies. He had shrunk from endangering the continuance of Mr. Canning's policy; and the consequence of his infirmity of purpose was the retirement of all the "Canningites" from the ministry within nine months of the death of their chief. He upheld to the last his friend's policy towards the Catholics, assisting and witnessing their emancipation in 1829. From that time the tide of progression in politics flowed strongly; but Huskisson's task in life was just done. He voted in the next session for a limited measure of parliamentary reform; he witnessed the death of the obstructive King George IV., and presently after died himself. It was by an accident on the railway,—the opening of the Liverpool railway; but the accident itself was occasioned by his frail and feeble condition of health and nerve; and it was as well that he should go to his rest before that tremendous series of reforms was brought forward which would have been too much for him. Each progressive statesman reaches his limit within perhaps an assignable time. Mr. Huskisson had done a great and singular work, and placed it beyond the reach of reactionary mischief. However heartily therefore he was mourned, it was from natural emotion at the loss of such a man in such a way, and not from any calculation of what more he might have done for us, if he had lived another ten years.

In contemplating the man it is impossible to overlook the light thrown upon his character by the devotedness of his wife. She was always his best support and aid in his work. She never recovered from the shock of his death: but she lived several years, eager to be spared till she should have secured his fair fame by the publication of his speeches under every advantage, and provided for his having such honour as noble monuments could give. The statue in the Liverpool cemetery, among others, is her gift.

In the one friend, progressive statesmanship took the form of practical insight into the great material interests of the community. In the other, it manifested itself by diplomacy and oratory in the interests of liberty, international and domestic. A middle-class man was requisite in the one case as in the other, though it was as true as ever that an aristocracy like ours has been, and continues to be, an indispensable safeguard of our liberties. The state of European society during the period which succeeded the peace was one which required the advent of what haughty people would call a political adventurer; a man who came fresh upon the scene, without hereditary entanglements. So Canning was there, with his genius, and his generous sympathies, and his ambition which had nothing sordid in it, and his unequalled powers of expression, by which to convey to the general mind and heart the needs, the aspirations, and the peril and promise of the time. It was impossible to put him down among the demagogues, as some people tried to class Mr. Huskisson with the bagmen. Old men remember how the demagogues abused him as an aristocrat, and how regularly he appeared in lampoons and caricatures as "the spouter of froth" on behalf of tyrants. It was at once necessary for the haters of political adventurers to accept Mr. Canning as a scholar and a gentleman, while the most crusty radical of that seditious time had "to own the soft impeachment" of a mutual sympathy on behalf of oppressed peoples, in both hemispheres. Thus was Canning the statesman for a progressive period, when the fate of nations might hang on the quality of the man who should virtually rule this country.

At the critical time of 1822, when the European peoples were trying to wrench themselves from under the heel of the Holy Alliance, we were so near losing Canning from his proper place, that nothing but the fitness of things could have kept him here. He had bidden good-bye to his friends generally, and had everything ready for going to India. Many grieved that he should go where his special gifts would be half wasted. Some of us may remember how we read in the daily papers of his last movements, as we had before read his last words in parliament. We read that he was at Liverpool, among his old constituents,—staying at his friend Gladstone's. There he was indeed,— sitting one day for hours at his chamber-window, looking over the sea. There was a little boy playing on the strand that day; and perhaps he glanced up at the window, and may remember the face that looked out there. That little boy was the Mr. Gladstone of our day. Mr. Canning was pondering some news which was on the way to the King in Scotland. Lord Londonderry had destroyed himself; and there might now be an opening for changing the political aspect of all Europe. He did not know,—nobody knew what would be done next. The King dreaded above everything the necessity of accepting Canning as a member of the Cabinet: Canning himself told his Liverpool friends, when the news was in all mouths,

that he had no knowledge whatever "of any arrangements likely to grow out of the present state of things." There was no other man, however, the Liverpool people said; and they were confident he would not go to India. The unprogressive politicians about the King put off to the last moment their invitation to Canning. It was on the 12th of August that Lord Londonderry died, and it was on the 11th of September that Mr. Canning became Foreign Secretary. He had then only five years to live; but, instead of going to India,—the India of the old Company,—he did such things at home that his son is now in India, carrying that empire through its transition from the rule of the Company to an immediate dependence on the Crown and parliament;—a piece of progression which was not at that time contemplated.

The King had special reasons for wishing Canning at the ends of the earth. Canning had been early a faithful friend and adviser of the Princess of Wales; he would never join in any of the measures of her enemies; and when he found that her affairs were closely implicated with the acts of administration at the time of her trial as Queen, he resigned his office at the Board of Control. It could not be at all agreeable to the King to have for his Foreign Secretary the old servant who had left the government for such a reason, two years before: but there was no alternative.

In spite of "the Anti-Jacobin," and other protests of Canning's against the revolutionary ailments of the public mind, during his early life; and in spite of his devotion to Pitt, and his opposition to Pitt himself on the question of parliamentary reform, Canning was now regarded as a progressive statesman, and disliked in high places on that account. He had worked hard to bring about the Irish Union, relying on the virtual pledge that the disabilities of the Catholics should be removed; and he was understood to be bent on the removal of those disabilities. Yet more, he was on the side of each nation which was unhappy under effete or cruel rulers, and this description comprehended so many of the governments of Europe, that the King trembled for the consequences to his own ease, and for the effect on his intercourses with his Imperial and Royal brethren.

The foreign policy of England did in fact turn into a new channel when Canning succeeded Castlereagh. It was believed that the latter, if he had gone to the Congress at Verona, would have protested against certain despotic designs, as Wellington did when sent by Canning; but the fact was universally known that the deceased minister was in sympathy with the monarchs, whereas his successor was in sympathy with their betrayed and outraged subjects. Canning's intentions were trusted; his acts were liberally construed; his speeches were idolatrously read by the liberals in every country who would have bitterly mocked at every act and word of Castlereagh's. Canning did not excite to insurrection. On the contrary, he rather precluded it by opening prospects of relief by better means. His dispatches are very quiet, and brief, and clear; and the more quiet and clear his words were, the deeper was the emotion they excited among anxious listeners.

What, then, was his policy? and what his purpose? It is enough to say here that his policy was that of Peace, at a juncture of such interior agitation; and his purpose was, in the first place, to break up the Holy Alliance. He proved himself a progressive statesman by holding these views in such a practical way as that the continental rulers at once found that they would have no aid from England in any scheme of aggression whatever,—against any neighbour, or in coercion of their own subjects, native or newly attached. As the South American provinces were actually released from Spain, Canning treated them as free. Everywhere he accepted clear facts, and acted upon them, instead of wasting time and breaking hearts over political fictions. It required a progressive statesman to do this. So much for his policy, in which he might easily be a representative man. In regard to his oratory, he was altogether exceptional. Statesmen constitute a class; but orators do not, nor ever can. The power is unique in each case; and all that we have to do here with Mr. Canning's eloquence is to note that it was the organ of the diffusion over the world of his progressive statemanship. In all wild places there was somebody who could recite some speech of Canning's. In countries where there was no press for the multitude, the multitude had means of reading what he had said. Wherever Englishmen travelled, they were looked at with interest and kindness as countrymen of the Minister who had willed that Princes should keep their word, and that peoples should have a hearing for their claims. If it seems to us now that there was nothing very remarkable in all this,—nothing more than we are now thinking and doing in the case of Italy,—the observation is itself an evidence of what Canning did for us. He excited the civilised world to rage on the one hand, and to transport on the other, by a policy which is to us, at this day, a matter of course; and he opened up the path to the point we have reached.

There was but too little time. When, in the spring of 1827, he became Prime Minister by Lord Liverpool's illness, it seemed a great blessing to the world. But there were persons enough, who did not think so, to deprive the world of the blessing. The opposition he had to contend with was perhaps the most outrageous on record; and it destroyed him. Everybody who had ever been quizzed by him, disappointed or mortified by him; everybody who feared his courage or his power, or who was tired of hearing him praised; all the foes of progression in general, and of the progressive statesmen of the day in particular, were encouraged to pursue him in full cry. They did it to the death. When he said it was the yellow curtains that made him look ghastly, he was in a ghastly condition. He was too much worn with other opposition to make any stand against disease; and he died, after an agonising illness, on the 8th of August, after five months' tenure of power as Premier.

The part of a Progressive Statesman has not been made entirely easy in this country, even by such pioneers as these. There was much to be

undergone by the next who followed this pair of friends. Sir Robert Peel had, in one respect, a harder task to fulfil than either Canning or Huskisson. He had to be converted to progression himself before he led a progressive policy. This was his difficulty; as that of lack of aristocratic position and fortune had been the impediment in the path of his friends: and Peel perhaps suffered the most of the three. In rank he was about on a level with Canning and Huskisson: but his great fortune, and his having been expressly trained for political life from his youth up, prevented his being taunted as a political adventurer, even if people had not been tired of the useless sarcasm.

All the three had to live and learn; but Peel alone had the difficult destiny of changing sides on great questions of policy. His father represented the characteristic British class of high Conservative traders. He gained a great "stake in the country," as our grandfathers were fond of saying; and he was ambitious that his son should increase the security of such a stake, and glorify the order of men who held it. All influences were brought to bear upon the child first, and then the boy, and the young man, to make him consider himself destined to an illustrious public career, and in the service of Toryism as it existed at that day. His heart and his father's would have failed them for fear if they could have known, when he left Oxford, what a set of measures he would be immortalised by. They would have prayed that he might rather die obscure.

When he entered parliament at one-and-twenty, graced by extraordinary university honours, and independent in fortune, he was on the winning side in every way. It was in 1809, when Perceval was minister, and Castlereagh and Canning were his colleagues, that Peel began his career; and when the murder of Mr. Perceval caused a recomposition of the ministry, Peel had become well enough known as a man of business to be appointed to the Irish secretaryship. O'Connell's party called him Orange-Peel: O'Connell himself pursued him with insult till they came to a challenge; and if there was an Englishman who could be pointed out as the representative of an anti-Catholic policy, it was Peel. He was honest in his opposition to the Catholic claims; but he was not satisfied with the method of governing Ireland; and here perhaps a close observer might have found a basis for speculation as to whether Peel would prove to be a stationary politician, after all. He made the best speeches against Catholic emancipation, session after session; but then, he did not relish or approve of, the sectarian quarrels in Ireland; and he had a notion that a sound popular secular education would be the best thing for the country. The smack of the pungent orange flavour was wanting in this Peel, his party observed: and when 1829 came, there were persons who said they had long ago thought what would happen.

In other questions he was assumed to be sound, as he himself took for granted he must be. His taste was rather for practical reforms than for high-flying political doctrine: but that he was sound in the faith, nobody doubted. He was so modest and diligent, and so respectful to the leaders of his party that nobody looked for the signs and tokens in him of the future political reformer. He was an administrative and economical reformer; but so much the less likely was it that he should occupy himself with liberalism in any shape.

So Lord Eldon and other Tories, who dreaded the vigour of Canning's genius, at the critical period of 1818, exerted themselves to bring in, to Canning's exclusion, the trustworthy Mr. Peel as member for Oxford. Oxford was thus provided with an anti-Catholic representative who would be a better Conservative in all ways than the restive and irreverent Canning could ever be. So thought the Eldons and Sidmouths to whom Canning appeared simply restive and irreverent, and Peel a model of discipline and deference as a partyman. They were sorry that he was steady in resigning his Irish secretaryship: but they should get plenty of work out of him by-and-by. Meantime he supported the Liverpool Ministry with all his force; and he was doing useful things in matters of currency and finance. His Bill for the resumption of cash-payments bears the date of 1819; and he was occupied with that class of questions till after the collapse and crash of 1825-6. He became Home Secretary in 1822, in the place of Lord Sidmouth, on which appointment it was observed by his party that "the substitution of the one for the other could have no effect on the course of administration." The outgoing minister regarded him as a docile pupil and creditable successor. He wrote of him that "nothing could have been more becoming and creditable" than Mr. Peel's behaviour in entering the Home Office. The old gentleman was unaware that Peel's notions of administration were as unlike his as the projects of a social reformer are unlike the devices of a detective policeman.

Canning and Peel were alike in their shrinking from all implication with the scandal of the Queen's trial: and they were the most prominent members of the Liverpool Cabinet during its latest period. No doubt Canning's mind wrought upon Peel's, both in regard to foreign politics and Catholic emancipation, though they were regarded as leaders of the two sections of the Cabinet. Their common horror of parliamentary reform was a strong bond between them: and Peel was certainly coming round to the conviction that the Catholic disabilities could not be maintained. When Canning became Premier in 1827, he lamented that he must lose Peel as a colleague, on account of the Irish question. On that occasion he declared that Peel was the only man who behaved well to him in his hour of difficulty, and that he regarded Peel as his political heir and successor. As Canning's difficulties and popularity at that time were caused by his reputed Liberalism, the declaration must have been abundantly startling to the patrons of the young Peel of twenty years before.

The time was at hand when Peel was to find what it was to be born into an untenable position, and to have to struggle over into another. When his great speech of 1829 was read by every fireside in the kingdom, the universal remark of both parties was that there was no conviction in his mind: he had acted from a regard to expediency

only. He said so himself. He had to choose between two evils; and he chose the lesser, without any pretence of liking it. This event gave the key to the rest of his life, if he and his critics could have understood it. It cost him much anguish to give up the repute of consistency, and he was slow to learn that the function of statesmanship had essentially changed with the necessity of a progressive policy. His business in life was to discern, in spite of early prepossessions, political necessities a little sooner than people in general, and to adopt them with a good grace, and adapt them skilfully to practice, without affording the smallest countenance to political profligacy or levity. It was a task of extreme difficulty, and not at all of supreme honour. He was satisfied, happily, with a lot of singular usefulness, invested with a doubtful or damaged glory. He gave us peace with Ireland; he gave Ireland a renewed existence; he retrieved our finance by a series of measures from the Bank Act of 1819 to the repeal of the Corn Laws in 1846, which might, in each instance, have cost him the sacrifice of his career and of his political reputation. No witness of his first change ought to have been surprised at any subsequent one, because, in each case, his sense of duty was clearly concerned. He was the sincere and devout high-priest of expediency, in that province of human life in which expediency is both the obligation and the rule of duty. He suffered acutely under the various kinds of censure and insult that his position exposed him to; but he rose in character as well as repute, in proportion as his function became clearly understood by himself and others. Before his death he was incomparably the first statesman of the time; and at home his influence was almost equally great, whether he was in office or out of it. His career was not what his father, and his friends, and he himself had imagined: and it was what he would have recoiled from in horror, if he could have had a prevision of it; but it was great in its way, and will be immortal as an illustration of a critical period in the history of Europe. He seems not to have spent any words or thoughts on this point—so deeply interesting to us watchers of the world's history. Peel's memorable concluding aspiration, when leaving office, affords full insight into his own view of his own career. He hoped to be remembered at the cottage dinner-table, where the poor man was henceforth to eat sweeter bread —"no longer leavened by the sense of injustice." He will be remembered there for generations to come. But he will also stand conspicuous in history as, by force of circumstances and by his wisdom vanquishing his will, the great Progressive Statesman of his age, whose work it was to lead on his country while other countries were standing still, or rushing all ways but the right; and whose everlasting honour it will be that the polity conducted by him grew stronger in compactness, loftier in intelligence, and more expansive in prosperity, while the political edifices of the Metternichs, and Bourbons, and Romanoffs, whom he knew so well, were crumbling into ruin, with or without previous explosions of revolution. The fact affords some hint of what England owes to her Progressive Statesmen. Harriet Martineau.

THE GREAT FIRE AT LONDON BRIDGE.

It would seem as if every now and then the elements had a field-day, by way of proving how weak are all the appliances of science to combat with them. Fire, especially, has been testing our cunning of late, and the ground it has chosen for the match against us has been in the neighbourhood of London Bridge. Within a very few years we have had Alderman Humphery's Wharf and Fenning's Wharf burnt down, and now the great fire of June 22nd, in which about two millions of property has been destroyed. After the two former buildings were destroyed, they were rebuilt, declared to be fire-proof. One of them has been tested again by the devouring element, and swept away as speedily as though it had been a card-house. In short, this last catastrophe has demonstrated that fire-proof buildings, as at present constructed, are neither fire-proof against themselves when of large area and filled with combustible materials, nor against neighbouring fires of great magnitude. Poor Braidwood, who has gone to his account, predicted long ago that our system of fire-proofing buildings was a delusion and a snare, and he also, with prophetic eye, foretold the time when fires would, through man's cupidity and carelessness, grow beyond the powers of man to extinguish them. It would seem as though we deliberately planned these costly warehouses, in which the riches of the world are stored, to burn, as we lay the fuel in the grate for the same purpose. Oil and tallow will rarely, if ever, be found stored alone; if they were, the difficulty of firing them would be great indeed, but with these materials we heap immense stores of hemp and jute, which are well known to be very liable to spontaneous combustion.

The materials for the future blaze thus being carefully provided, we pile upon the whole in the upper floors precious silks, teas, and wines. The hemp fires, as it has just done at Cotton's Wharf, and the body of flame becomes so great that fire-engines sink in their presence into ridiculous squirts. Mr. Braidwood has shown that in such fires as that which we have just witnessed, the heat inside these vast buildings becomes that of a crucible, so fierce as to melt the iron pillars and girders with which the different floors are supported, like so much glass. Indeed, this iron, to which we trust so much in our fire-proof buildings, has been proved to be a positive source of danger. Iron heated beyond 600° loses its cohesive power, and becomes utterly untrustworthy. The girders which support the floors are sure to expand, and their action must then be to destroy the strongest walls. For all we know to the contrary, poor Braidwood met his death in consequence of the thrusting out of the walls from this very cause. In order to insure the safety of our so-called fire-proof buildings, the only reliable method is to build with solid bricks, all vaultings being made of the same material. The interior of each warehouse should be so subdivided by these fire-proof walls, that the body of flame and heat in each should not affect its neighbour. If this were done, we predict that we should see no more great fires in London. At one time it was the normal condition of Liverpool to have

several of her largest cotton warehouses destroyed in the course of the year, and so great was the danger from fire that insurances ran up from eight shillings to thirty-five shillings per cent. In 1841 it was determined to cope with the evil not with fire-engines only but with an act of parliament, which forbad the use of continuous roofs, wooden doors, and penthouses, and enjoined the running up of party walls four feet between each building. But the most essential enactment of the new bill was a clause which restricted the cubical contents of the buildings themselves. The result of this measure was a fall in the rate of insurance to its normal level. We have, it is true, the Building Act of the 7th & 8th of Victoria, which limits the cubical contents of warehouses in the metropolis to 200,000 feet—that is, the warehouses may be larger, but the interior walls with which they are divided must never enclose a larger space than we have mentioned. But access must be easy between one part of a warehouse and another, and this is usually given by means of fire-proof doors, which are supposed to be always closed when not actually in use: and as fire-proof warehouses, even of the best construction, are no stronger than their weakest part, we have this source of danger always to apprehend. When a fire occurs it is generally too late to shut the door from the inside at least; but we think some plan may be devised by which either these doors may be closed from the outside, or they may shut themselves on the approach of fire. As long as we have these weak places still remaining in our fire armour, we are no stronger than the vigilance of the warehousemen whose duty it is to shut these ponderous doors.

But independent of the question of fire-proof buildings, it is imperatively necessary that the legislature should interfere with the reckless manner in which all kinds of combustibles are stored within the heart of the metropolis. Is it absolutely essential that hemp and tallow should be stored together, and is turpentine a safe neighbour to such materials? We are told that enormous quantities of turpentine were stored in the cellars of the warehouses next to Alderman Humphery's, the last of the series destroyed. If these had caught, there is no knowing where the destruction would have ended. As it was, it was only the mercy of a total cessation of wind, which prevented half the Borough from being destroyed. It is also very questionable if such matters as oil and tallow should be permitted to be stored near London Bridge, at the very entrance to the pool, which is, at certain seasons of the year, crowded with shipping. Had this fire happened in the winter, the most probable thing that could have happened, would have been the burning of the whole fleet of colliers that usually lie contiguous to the wharves on the Surrey side of London Bridge. The quantities of oil and tallow floating upon the water and drifting down the stream, made it look like a sea of fire, in which, indeed, several boats, a barge, and one ship were consumed. Imagine, good reader, the wild consternation that would have seized the shipping on the river attempting to escape the destruction of fire-ships floating down towards them! Imagine the fearful loss of life, and the further land-fires that would have happened by these fire-ships striking against the water-side wharves; and further reflect that every condition but one was present—and that one, which is sure to present itself at any other time in the year—the presence of the collier fleet—to ensure the fatal combination of calamities we have pictured. Is it right, then, we ask, that a combustible that can live on the water should be stored in such a situation that it might be poured in flame upon the great "highway" of the world?

But it is not our purpose to paint possible disasters, and to frighten our readers with suppositious calamities; we have quite enough to do to awaken the attention of the public to the dangers that are imminent, but which we have yet time to avoid by judicious enactments. We have seen how the flank of the Building Act may be turned by the simple carelessness of a porter in leaving open an iron door; but we do not think the public are prepared to hear that every provision of this useful Act is set at nought by the great Manchester warehousemen of the city,—or rather they have chosen to view the law through their own special spectacles. In consequence of their breaking bulk, these places of business are, they say, exempt from the category of mere warehouses. Acting on this plan, the Manchester warehouses have grown into enormous storehouses, full of the most combustible materials, without having any partition walls at all. Cook's warehouse, in St. Paul's churchyard, is perhaps the most striking example of this evasion of the letter of the law. It contains no less than 1,100,000 cubic feet of space, filled with cotton goods, or nine hundred thousand feet more than the space contemplated by the law. And Cook's warehouse is only a sample of these kind of buildings that are growing in every direction in the heart of the city. Mr. Braidwood was never tired of raising his warning voice against these centres of dire conflagrations. These warehouses, he was often heard to say, are inaugurating an era of gigantic fires, against which the efforts of the Brigade will be powerless. The buildings, too, are so constructed as to render the firemen afraid to enter them. Iron girders, supported by iron columns, hold up the floors of these enormous buildings, and when these become red hot, in consequence of the fierce blast to which they are subjected, the fireman plays upon them at his peril, as the water suddenly contracts them on one side, and they snap and shiver in an instant, bringing the whole building down with a run.

Whilst our wholesale warehousemen are thus storing in the most densely populated portions of the city the elements of fearful conflagrations, the water-companies deny us the water to battle with them. At the late fire it was at least an hour before the engines could be supplied; during this precious hour the fire had time to fortify its position, and the water—when it did come—was too late to be of service. The public should demand a constant supply at high pressure, in which case the one element would always be ready to combat the other at whatever ordinary elevation it may show itself. If the magnitude of the disaster

which has just befallen the insurance companies, leads them to call the earnest attention of the legislature to the points which we have pointed out to our readers, even the three acres of ruins, now to be seen from London Bridge, will not tell their tale in vain. A. Wynter.

THE MILL ON THE RIVER MOLE.

Where are the waters wandering?
The miller's daughter asks;
Under the mill-wheel, over the mill-dam,
Plying their noisy tasks,
They murmur and brawl for a moment,
Then onward and onward they go;
Ever advancing, never returning—
Where do the waters flow?

Where are the waters wandering?
Lying, last night, on my bed,
List'ning their restless dashing,
Methought their wild voices said:
"So shall it be on life's current—
A hope or a joy once o'er—
A wish or a dream once uttered—
Like us, shall return no more!"

Then my busy thoughts went wand'ring
Far into my coming life—
Shall it bear me hence on its bosom,
To mingle with care and strife?
Never, ah! never returning,
As those sad whispers foretold,
To the happy hours of the present—
The careless dreaming of old?

With the voice of the wand'ring waters
Mingled at early morn
The sound of the whirring mill-wheel,
The gentle fall of the corn;
And the twilight, misty and mournful,
Faded away from my sight,
Till the drooping boughs of the willows
Were tinted with rosy light;

And the waters onward wand'ring,
Laughing and sparkling went;
Till my lips their smiles repeated,
And I learned the lesson, Content.
Shall I fear—whilst a loving heaven
Such smiles and guidance bestows—
To float on life's darksome waters,
Or reck where its current flows?

Louisa Crow.

THE PAINTER-ALCHEMIST.

A tall lean man in a student's long gown, much patched and torn, crouched before a furnace, the crimson glow lighting up weirdly the many lines and hollows of his wan face. His beard was ragged, his hair long and matted—once dead black in hue, now part grey from time and trial, part brown from dust, and singeing, and neglect: he had wild-looking, bleared eyes, scorched, claw-like hands, a painful shortness of breath, and the tremor as of palsy vibrating every now and then through his whole frame. The room was large, low-roofed, and lighted almost altogether by the fire, for the sun could hardly pour any of its rays through the long narrow slit of a window cut in the very deep wall of rubble and rough-shaped stones. An utter want of order prevailed in the room and its garniture. Open books and tattered manuscripts, flung about anyhow, covered the floor. Alembics, retorts, crucibles, jars, and bottles of various forms, thick cobweb festoons and coatings of dust; here a pile of faggots, there a heap of charcoal; while mingling with these and in equal confusion a painter's implements—the easel and wand, the pigments and stack of canvases and panels. The ceiling was black from smoke, and the air hot and stifling, charged as it seemed with poisonous fumes. Molten metals bubbled and seethed over the red fire. In the doorway stood a young man in a grey surcoat with silver buttons, a silver-hilted dagger swinging from his belt. He was fanning his face with his cap, evidently oppressed by the intense heat of the chamber.

"I have been deceived then. You are not Francesco Mazzuoli?" he said.

He was small in stature, light and supple in figure, with long abundant brown hair and delicate if not regular features.

"No," answered the man by the fire, without turning round. "I am not he whom you seek."

"And yet they told me I should find him here. He is my relative—my cousin."

"Your name?"

"Geronimo Mazzuoli."

"The son of Michele?"

"The same."

"Come nearer."

"I may not, the furnace is too hot."

"To the window then, Geronimo," and the watcher by the fire rose with difficulty and dragged himself, rather than walked, to the place indicated. He stood there a moment, letting the daylight fall upon his haggard features.

"Now look upon me," he said. "Should you know your cousin?"

"For years I have not seen him. We parted at Parma a long while back. He journeyed to Rome. I have been there since, and learnt tidings of him. Surely I should remember his face; and I have seen his picture, and lately too, at Arezzo, in the house of Messer Pietro, the poet. It was given to him by his master, the Sovereign Pontiff."

"Well, and how looked he in his picture?"

"It was painted by himself, and strangely like him, so it seemed to me, and so all have told me. A noble youth, with the beauty of an angel rather than a man—in his eyes a glory—"

"Enough. Why do you seek him?"

"I bring him news from Parma. I am a painter also, but younger—poorer—I seek of him instruction and help. I would learn from him the secrets of his art. But you are not he, let me go hence therefore."

"Peace! I *am* Francesco Mazzuoli!"

"Impossible!" and Geronimo started back at the wild, crazed look in the other's eyes. "You are old and bent, and—yet pardon me. I should not speak such words to you."

"Where is my mirror? You are right, Geronimo. It is not the same face I painted at Parma in the house of Michele, your father. The same yet not the same—I am old and broken; black from the fire, withered and dying."

He spoke in a strange plaintive tone.

"Ah!" cried the young man, moving towards him, "that is Francesco's voice. Unsay your words, cousin. You are not dying?"

"Living then—for the misery, and shame, and sorrow of life."

"Living for your art, Francesco."

He gave a wild, shrieking, unearthly laugh.

"For my art?—it is dead—look here," and he drew his cousin to the further end of the chamber, and tumbling down a pile of canvases, turned one over with its face to the light. "Look, do you see this?"

"The Roman Lucretia," said Geronimo. "You are indeed Francesco. If I cannot see it in your face, I see it here. Cousin, it is divine. But why unfinished—to work and complete it!"

"I cannot—look into the eyes."

"They are glorious—they glow with life—they move—"

"You see it then?" and he laughed again. "Yes, they are *her* eyes. It is *her* face. I can paint *that* only. I see but *that*. I try to work, but then she looks upon me out of the canvas with eyes of love, of sorrow, of reproach, and—and the tears cloud my sight, cousin. I can paint no more."

"Of whom do you speak?"

"Catarina."

But the word conveyed no meaning to Geronimo. He wrung his cousin's hand kindly.

"It is the secret of your heart, Francesco," he said, in a low voice. "It is holy ground—I will not seek to trespass on it." And he turned away.

For some minutes neither spoke.

"To think that *you*, cousin, should cease to paint!" exclaimed Geronimo at last. "*You*, with the crown of our profession within your arm's reach; *you*, with your skill, your power, your genius—self-critical, and dissatisfied, and desponding! What hope is there for me, then,—a poor plodder only—a simple struggler in the ranks, never to rise to a command? You, the painter of the Madonna in the Air, heavenly in her beauty, robed in golden gauze, the bright flesh glowing through the draperies; the Infant

Christ—Infant and yet Christ—with the globe of the earth in his hand. You, painter of the Vision of St. Jerome and of St. Guiseppe, the Blessed Virgin, and the Angels—works at which the soul thrills, and prayers rise unbidden from our hearts. You, of whom they say at Rome that the spirit of the dead Raffaello has passed into your body, Francesco."

"Do they say that?" asked Francesco, trembling, and pressing his hands upon his heart. "Such words are as exquisite music to the ear. Once they would have made me glad—how glad!"

"Why not now, cousin?"

"Now?" and his wild laugh broke out again. "Now I have a nobler mistress than art."

"What mistress can be nobler?"

"Alchemy!" cried Francesco. "Look here," and with a hurry and eagerness that approached violence, he dragged Geronimo to the furnace. "Look—nay, shrink not from the heat, it is nothing. Watch with me the mystic changes of the crucible, and you shall see the frothing liquid change into dolphin hues; the black crow, the plumed swan, the peacock's tail, the green lion, the pale citron, the scarlet dragon! No pigments can render those tints, Geronimo. By them your brightest palette is but dull, and drab, and dead. Stay with me, and share my studies. All my discoveries shall be yours. You shall halve my wealth—I have found the powder of projection for producing gold, the blacker than black; I have found the congelation of mercury, the flower of the sun, the perfect ruby, the universal remedy that shall make us live for ever, young, and rich, and noble, and beautiful."

"You have found these, cousin?"

"Ay, or shall find them, boy, 'tis the same. I will initiate you, Geronimo, in the sublime mysteries. You shall know the secrets of Jason's helm, Pandora's box, the dragon's teeth, the pelican, the crosslet. We will together break the glassy seal of Hermes. Oh, Geronimo, you will love with me this glorious science. It is nobler than art, for it absorbs it; it is universal, it is all-pervading. The whole world is but an allegory of science. See here," and he hurried again to the pictures, turning them over with trembling hands. "What call you this?"

"The Conflict of the Archangel and the Evil One."

"'Tis more than that—a parable, the sage subduing science, winning the philosopher's stone, the stone of two substances, the fixed and the volatile. The throat of the dragon is the fixed salt, the tail a symbol of the volatile element. Here again," and he pointed to another picture, "the Five Virgins receive from above the ingredients for making gold, the foolish scoffers at wisdom are these with their lamps untrimmed. Here the Magi bring gold, and frankincense, and myrrh—types of sol, and sulphur, and mercury. Why turn away, Geronimo?" asked the painter, panting for breath and trembling with weakness and excitement.

"These are sinful words, Francesco," said the young man, gravely; "perversions of our faith. What would the holy brotherhood of the Staccata say to such speech as this?"

"Ha!" cried Francesco, wildly, "they beat me for less, flung me into prison, bound me with chains—see where the rust bit into my wrists!"

"And why was this?"

"I was to adorn their church of Santa Maria with frescoes. I toiled for them a long while. I painted the Madonna borne up by Angels, gazing in devotion at a glittering cross cased in a crystal urn. The eyes of Catarina suddenly looked upon me from the eyes of the Blessed Virgin, and I paused. Then the monks poured gold into my hands. I turned again to my crucibles and my furnace. They called me cheat and robber, and imprisoned me. I escaped from them. I am free again, Geronimo—before my furnace again!"

"And the frescoes are finished now?"

Francesco shook his head. His cousin seemed pained at this recital, and turned his eyes to the window.

"You shall stay here and study with me, Geronimo. Soon the glory of the science will dawn upon you. Listen, now. It is all more simple than you deem it. All metals are of like components—earth and water; all metals would be gold were their components purely and fittingly mingled; of the water comes mercury, of the earth sulphur—they are the male and female of mineral creation. Purge these metals in the hottest fire, rectify them by more or less sulphur, by more or less mercury, and gold *must* come. I say it *must*, Geronimo. That step gained, we mount to other marvels. We go on—"

"Peace, cousin! these are thoughts to you, perhaps; they are but words to me."

"You will not hear me? You will not grow rich with me?"

"No; I want not your gold! your elixir! your long life—"

"Say that again. You want not gold? You—a poor painter?"

"Oh, Francesco! turn from these pursuits which will but madden and kill you; quit this heated room, poisonous with charcoal fumes, and come out into God's pure air; close your books, and fling away your crucibles, enter the church of S. Stefano, and pray for pardon and for strength to resume the profession you have degraded—the noble art you have trampled under foot. Be worthy of the spirit of the dead Raffaello. Paint again as you once painted, as you alone of living men can paint."

Moved by these words, Francesco cowered before his fire, hiding his face in his hands. Geronimo wiped the heat drops from his forehead. The room seemed to be unbearably hot. He moved to the door again.

"Don't leave me, Geronimo, I am very weak and sinking—don't leave me. I can pardon your words, you know nothing of the great science you despise, but when you see the yellow gold forming in the crucible—when you see the commonest metal transmuted into gold—when wealth unbounded lies at your feet—"

"I have said, cousin, I want not your wealth; and you are wrong, believe me, Francesco, to squander what is nobler than gold—your genius—upon so vain a quest."

"How! a vain quest?"

"I am not learned, Francesco, as you are—still, *I believe!* Let us say that there are mystic secrets to be discovered only by close and painful study and seclusion, and poring over the crucible and the cauldron. Who are we taught shall probe these mysteries? The pure of life, the good, the holy, who pray as they work, who toil for heaven's glory, not their own; who seek gold, not for the good it will do to them, but for the good it will enable them to do to others. Will the covetous succeed, do you think? Never!"

"Spare me, Geronimo!" cried the alchemist, piteously.

"Will gold be found in the crucible when fraud has heated the furnace? Never! You have robbed the monks of the Staccata, taking money and not giving toil; it is *their* money that consumes in that fire. Francesco, you will never find the secret—you seek your own vantage, and you are a cheat!"

"Geronimo!"

"I am sick speaking such words, but I must speak them. May the Virgin make them reach your heart."

"Stay! lift me up—what day is this?"

"The 24th of August."

"And the year?"

"The year of our Lord 1540."

"Ah! the game is nearly played out, Geronimo. It was as I thought. The spirit will quit me, then, as it quitted the divine Raffaello. It was at my age he died."

"You were like him once, Francesco; you had the same sweet smile, the same grace of manner, the same kind eyes and witching voice."

"And now, cousin, now you would say I am savage and ragged, burnt and mad. Yes; very nearly mad. Let us do as you say; let us go out into the air, I am very faint and feeble, and there is something weighing on my heart, and staying my breath—let us hence, I am stifled."

"And the fire?"

"It must go out. I shall need it no more."

He spoke in a tone of deep suffering. Geronimo bore the sinking man into the sunshine. It was almost blinding after the darkness of the laboratory. The sky was deep blue, with here and there a dapple of vapourous white.

"I breathe with more ease here, Geronimo, though the light beats cruelly upon my poor scorched eyes. Don't withdraw your hand, don't shrink from me."

"Indeed, Francesco, I do not."

"Promise me one thing—nay, two. Do you hear me, cousin?"

"I do. I promise."

"When I am dead—"

"Nay, speak not of it. You will live yet, Francesco."

"Peace! I am dying, and I know it. Hear me. You will finish the frescoes of the Staccata for the holy brotherhood, without reward, save only the dead Francesco's thanks."

"To the best of my abilities, I will do this, cousin."

"More—how my hands burn, and yet I shiver; this is fever, is it not, Geronimo? More—let me be buried at the Fontana, the church of the Servite monks, a mile from Casal Maggiore. Let me be buried as a lay brother, without shroud or coffin, save the robe of the order, and place a cypress cross upright on my breast. You will do this? You swear it?"

"I will, indeed."

"So, I believe you. I would be near her even in my grave; and, oh! Geronimo—"

"Speak! what would you, cousin?"

"Blame me not when I am gone—cry not shame upon my grave. If I have been wrong, wicked, impious; if I have sought gold for itself only, as you say, from covetousness—yet—yet there is excuse."

"There will be only sorrow for you in my heart, Francesco. No blame, no bitterness."

"But hear me. You remember, I left you at Parma, I journeyed to Rome, years and years gone. There, Geronimo—there, I loved, with my whole soul, with a love that preyed upon my brain, Catarina—call her only that—more of her name I have breathed to no living soul! I may not tell even to you, my cousin. Look at her face in the face of the Roman Lucretia in the picture; see her eyes in the eyes of the Virgin in the fresco of the Staccata. I loved her madly! Years have gone by, and still that love is mine—new and young and restless in my heart as ever."

He stopped breathless, while Geronimo wiped the wan face and brushed away the withered, tangled hair from the furrowed forehead.

"It was love without hope, Geronimo. She was far above me, noble and rich as she was beautiful. I, a poor painter, the son of a poor painter, the child of dead Filippo Mazzuoli, the flower-painter. I, to dare look up so high! Still, I loved. I knew that she often visited the workshop of Valerio Vicentino, the carver in crystal. With my best picture I bought of him the right to loiter in the room where she might come. It was such happiness to look upon her, to be near her. Soon my heart would bear silence no longer—my passion would burst into words. The opportunity came. I told her all and learnt from her own lips that my love was returned. The miserable folly of this was clear to all others, perhaps, but not to us. Then the end. The black curtain fell between us. We were cruelly sundered. I was driven from her presence, never to see her again. While, yet, there was a whisper torturing my ear, that if I had been rich she might have been mine! I was haunted by a demon that ever cried to me, 'Gold! gold! get gold! A painter you will starve, a sage you will grow rich—find the philosopher's stone, and buy of her proud kinsmen the hand of Catarina!' Well! I have toiled over the furnace, I have watched the crucible—— What sound is that, Geronimo?"

"I hear nothing."

"It is the music of angels! and one voice, with, oh! such a plaintive wail in it, thrills through all. Listen, Geronimo!"

"I hear nothing—yet, stay. Ah! it is the nuns of Santa Lucia winding along the footpath, singing as they approach."

"Geronimo, it is *her* voice; Catarina joined the sisterhood of Santa Lucia! Quick! bear me to her. It is for her I have surrendered all—my art, my life, perhaps even my soul! I have ventured

these, and gained—nothing! Oh! let me crawl to her feet! Let me see her once again!"

As he spoke his voice grew fainter, fading at last into little more than a trembling of his lips. As he essayed to rise, his strength failed him, and he sunk back into the arms of Geronimo. A quivering of the seared eyelids, one long-drawn sigh, and all was over.

The procession of nuns, singing the Ave, passed the house of the alchemist. They paused at the sight of the young man bearing in his arms the lifeless Francesco, and holding to his lips a silver cross. One of the nuns came forward—a tall, slight figure, with a pale, sorrowing face, and a pained look in her eyes.

"He is my cousin," said poor Geronimo, "and very sick, I fear."

The nun bent down, and touched with her thin white fingers the blackened hand of the painter-alchemist.

"He is dead!" said the nun. "Heaven rest his soul!"

"My poor Francesco!" said Geronimo, and his tears fell on the dead man's face as he stooped to kiss his forehead.

"Was that his name?"

"Francesco Mazzuoli, painter of Parma, sometimes called Parmigiano."

"No! no!" With a strange wild cry the nun took his head into her breast. "This is not Francesco!" and she gazed into the livid, withered face eagerly, passionately.

"So please you, it is he indeed—a noble painter. I am his cousin, and know what I say. He sought to grow rich, poor soul! May God forgive him, he practised alchemy! He sought for gold, yet not for himself. Perhaps his brain was turned; he loved, yet haplessly so."

The nun did not speak. She had fainted on the body of Francesco, with her lips upon the lips of the dead man.

"And there were tears in her eyes," said the lady abbess of the convent afterwards. "I never saw tears in her eyes before. Perhaps she will be happier now."

Parmigiano was buried, as he had desired, in the church of the Servite monks, with a cypress cross upright on his breast. Geronimo often found other flowers strewn upon the grave than those he had himself placed there, yet he never knew from whose hand they came. Often to himself, though, he would say:

"Surely the eyes of that sister of Santa Lucia look out in the eyes of the Roman Lucretia, and in the eyes of the Holy Virgin in the fresco of the Staccata." DUTTON COOK.

SAGARTIA ANEMONES, OR MY DRAWING-ROOM PETS.

"Unheard by them the roaring of the wind,
The elastic motion of the waves unfelt,
Still, life is theirs, well suited to themselves."

"Rien n'est plus commun que les bonnes choses; il n'est question que de les discerner, et il est certain qu'elles sont toutes naturelles et à notre portée, et même connues de toute le monde."

THANKS to Gosse, who tells us "the Sea Anemone is an indubitable animal, and its organisation more complex than is usually supposed," and to other men of science of our day, Marine Zoology rises year by year like a growing child, and in the microcosms of our rock pools, nestling rocks, and sandy nooks, we find that life there has its pleasures and its pains, and that there are beings, who, in spite of having once puzzled writers whether to consider them "as a superior rank of vegetables or the humblest order of the animated tribe," are replete with vivacity and animation, sensible of the summer sunlight and the winter cold, and day by day developing to our minds the fact that they have instincts, will, and disposition, as full of interest and amusement as their forms delight us, each in its own kind by their beauty, their varying hues, and their peculiar and most wondrous construction.

When we hear of the "Beadlet Actinia," who displayed its velvety robe and blue turquoises in an aquarium for *twenty years*, how utterly insignificant sounds the tale we tell, in an experience that boasts of little more than a year; but each day might have been a month, such a source of occupation and pleasure has it afforded me to foster and watch the lovely inhabitants of my two or three glass vases—Aquaria. Each individual is endeared to me by association, whether coaxed and petted from its home in the depth of a glassy pool, "from its snug arm-chair," in its native lime or sandstone, from some niche in the overhanging or perpendicular rocks, "or on the surf-beaten sands that encircle it around."

SAGARTIA VIDUATA, THE SNAKE-LOCKED ANEMONE.

The oldest, and to me the most attractive of my pets, is a beautiful Sagartia Viduata, a slim, graceful shaded drab column, warmer in the tint as it rises higher, and carefully striped longitudinally with lighter hues; a fancifully pencilled greyish-tinted disc, with a distinct white mark at the corners of the mouth, and five rows of the purest translucent greyish-blue-tinted tentacula and viola. The substance of the Viduata is of a leathery construction and its constitution apparently like most creatures well formed and healthy, fully adapted to battle with the storms of life; and agreeing with the poet "that sure there is need of *social* intercourse . . . . . in a world that seems to toll the death blow of its decease, and by the voice of all its elements to preach the general doom," the Viduata is seldom found alone. It is somewhat select, however, in the choice of its companions, and found most frequently on terms of the greatest intimacy with the queenly Actinoloba Dianthus Anemone, whether pendent side by side with it, and like it revelling in a crystal drop—for the Sagart Anemone, like the prudent oyster, retains sufficient water to keep it in luxurious comfort during the ebb of tide—cushioned within its own walls, a pulpy cone of jelly, or gummed and flattened to the rock, like a piece of card, in lazy indolence and apathy. Born to an active bright existence, and reared to remain steady and unmoved amidst the roaring of the waters and the violence of the storm, the Viduata, with the patient calmness and resignation that betokens a well-regulated mind, bears his reverse of fortune and translation to a narrow and circumscribed home

with tranquil fortitude, and seldom allows many hours to elapse ere it settles quietly down in some shady corner, if practicable, plumes out its snaky locks, and enjoys the good that is left to it. The placidity of its temper is also manifested in the temperate use of its *acontia*, or missiles of defence, those *tiny white threads*—barbed ecthorea—that are coiled up in different chambers—cnidea—of the body, of all classes of Sagartia Anemone, and form such powerful weapons of defence to those who attack or annoy them. My Viduata is not erratic in disposition; for some four months it remained quietly domiciled in a snug corner of its new home without evincing the slightest curiosity to learn anything of its capabilities or its inhabitants beyond what was seemly to its own comfort and dignity; elevating himself sufficiently to dress and expand his flexuous tentacula, or under the shade of semi darkness elongating its slender column some two inches and a half high, and with a modest graceful bend glancing at the world around him. But if silent, our Viduata is without doubt a keen observer; and with a laudable curiosity and that friendliness and sociability that is instinctively characteristic, one morning,—after partaking of a somewhat voracious meal of raw minced mussel, served to him as a Chinaman takes his rice, bit by bit, from the end of a chop-stick, and conveyed by *him* to his brown lined, wide open mouth, with one of his flexile tentacles, as an elephant conveys food to his mouth by the use of his trunk—was found settled in a new residence, in close proximity to some tiny yellow cup corals (Balanophyllia Regia) and again beside a noble colony of his much-loved Dianthus.

Here where "old faces glimmered through the door, old footsteps trod the upper floors," invigorated twice a week by, I must own, voracious meals, Viduata lived a pleasant summer life; but as winter approached there had evidently been a midnight conclave and a moonlit flitting, for one morning a new flat-surfaced rock that stood in the centre of the tank was in the firm possession of Viduata, along with a handsome Plumose and two fairy elves of Sphyrodita Sagarts, and there they are now, our Viduata leading a calm, undisturbed life, now and then taking a fit of indolence and sinking down into an apathetic flatness, which none other of the Sagarts can surpass or equal, but whether instinct guides him or the sense of his olfactory nerves arouses him, it is for a naturalist to declare; for place a small piece of *mussel* on the closed aperture of its body, and after a moment or so, up rises the column, out come the tentacles, and agape goes the mouth like a young fledgling.

ACTINOLOBA DIANTHUS, THE PLUMOSE ANEMONE.

Many years ago, in one of the colonies, when taking luncheon on board an American man-of-war, a young Yankee officer, after amusing me by a multitude of questions about England and the English, exclaimed suddenly:

"Well! you tell me that people would not take off their hats in the streets to a nobleman without they knew something of him personally. I guess *I* should take off my hat to the Queen of England or the Duke of Wellington if I met them."

This involuntary republican feeling of respect for excellence and worth ever recurs to me as I watch the queenly Dianthus. Elastic and firm in consistency, with a graceful, smooth, circular column, frequently semi-transparently streaked, capped by a *fosse* and a membranous frilling of tentacula, and clothed in sumptuous silky hues of pink, creamy white, or translucent neutral-tinted buff, dark grey, olive, or white, the Diver in the Gulf of Charybdis (of Schiller) never brought up a fairer gem. Whether drawn up to its full height, displaying its tentacles dotted on a frilling, and giving a Queen Elizabeth ruff, all puckers and bows—floating with stately grace, its plumosy tentacles for sails, Nautilus fashion—moored to a rock, its column bending gracefully, "queen lily and rose in one;" or with a diadem of marabouts spread out around the *fosse*—that order of beauty and birth peculiar only to the Actinoloba Dianthus encircling it like a ring, and, by forming a division between the column and the *physiognomy*—if I may be allowed the expression—proclaiming it fully thereby queen of sea anemones.

The *young* Dianthus, with the sympathy and love of a tender nature, at once opens and expands to true friendship, and sheds the radiance of its charms and beauty on a new world around him; but, dignified and placid as is the general temperament of this queen of Actinia, those of *mature* growth, like many beings gifted with reasoning powers, cannot at once submit to a reverse of fortune with that resignation and fortitude which betokens the true nobility of birth and breeding; and frequently many hours elapse after its removal from its ocean home and a senseless cone bestrewed by thready flags of distress (*acontia*) alone tells of our queen of the castle. But, with "self-renunciation life begins," thinks the noble anemone, as she slowly rises like a mermaid from the deep, and spreads out her *golden* hair, glancing proudly but benignantly around her, dining or breakfasting, as the case may be, with luxurious comfort but not voracious appetite, and appearing, later in the day, in the transparent silken robes and courtly plumes that betoken her birth and race—a tribute of gratitude which all the Sagartian Anemones render for their food, most of them appearing in their best and loveliest robes and forms after a hearty meal.

Shall I say that my Plumose loves with passionate strength? For, if slow in making new friendships, like the true and warm hearted, it puts forth all its best energies with sterling reality when once it does become *attached*, suffering its very fibres to be torn and lacerated ere it can wrench itself away, or be persuaded to move, when necessity requires a change of scene or position. And, like one whose life has not been in vain, and being "dead yet speaketh," the bit of fibre left behind buds and expands, and, after a few days, a miniature Plumose delights us with its saucy, *feathery face*, begins to eat and grow apace, and daily tells us of her who was once there. Slow to anger, and consequently sparing in the use of its *acontia*, and dearly loving the society of its own kith and kin and a few select and chosen

acquaintances, for it is seldom or ever quite alone, the Actinoloba, although apparently delicate in looks, is of so vigorous and healthy a constitution that it can stand the vicissitudes of life with greater fortitude than many others of the Sagartian race; and I can but persuade myself that, seated on its stone ottoman, in its aqueous drawing-room, surrounded by those it loves, or comfortably stretched in a horizontal position with ample room and a pure atmosphere, that, in spite of captivity, the Actinoloba Dianthus of the aquarium are a tolerably happy, satisfied race of beings.

SAGARTIA SPHYRODITA, THE SANDALLED ANEMONE.

Surely, if that charming creation, Ariel, sang, "In a cowslip-bell I lie," the mermaids, Lorelei, or nixies—I don't know which are the tiniest—must have found as dainty a couch in the tiny bells of the Sagartia Sphyrodita, a pretty little fairy sea anemone, with a white calyxed-shaped column, streaked transparently, and just tipped in the yellow disced with a warm brown tint, yellow or white disc and mouth, and opaque white tentacles, with a shading into purple where they join the disc, and the *ensemble* so closely resembles Burns' "bonny gem," the field-daisy, that, nestled in some sea grass, or ulva, or gracefully pendent from the satiny fronds of Iridēa Edulis, or penninerved Delessaria, and it is difficult to believe that it is not a meadow flower, but a sentient being, with a temper as easily put out and as easily appeased as a child's, "and, like the young lions, seeking its meat from God."

Our first acquaintance with Sphyrodita began on a lovely summer day when the spring-tide had sent the tired waters to sigh and sleep so quietly, that I had grown oblivious, and was so engrossed in culling the treasures of a rock pool, "that slowly from slumber woke the unwilling main, curling and murmuring until the infant waves leaped on his lap," and I ran a chance of being lured to destruction in some coral grove, when, lo! as I plunged in, and drew a long sighing gasp, with a momentary wish that I had been born a diver duck or sea-gull, that could ride the bosom of the ocean instead of having to furrow through it like a plough, a frond of "Fucus Serratus," freighted with some half-dozen of these sprites of the waves, came drifting towards me, and at once perceiving that chance had given me a prize, I gave all but a shout of Eureka! as I grasped them, and with the enthusiasm of an Archimedes went bounding through the waters to *terra firma* again. And in spite of frequently finding colonies of these Sphyrodita snugly domiciled in the niches of perpendicular *mud*-covered rocks, like so many jewels set in a frame, I cannot but think that, soft as is their construction, and delicate as is their nature under rough treatment, they clearly belong to a hardy nomadic race, "who love to roam o'er the dark sea foam," for often on turning over the fronds of Rhodomenia palmata, or Fucus, I come upon the pretty brown tipped cups of clinging Sphyrodita.

In their drawing-room home they roll themselves up and sleep as dormice do in cold weather, but with warmth and sunlight they expand their petal-like tentacles, and as flies in summer air, now float on the surface of the water, now gem the fronds of the sea-blooms, hang like blossoms from a spray, or deck the brown rock with life and beauty.

SAGARTIA NIVEA, THE WHITE ANEMONE.

In snug little homesteads in the water-worn holes of shelving limestone, decked from without with shrubby Dasya, gorgeous scarlet "Delessaria sanguinea," or winged Alata, and "with a flooring of sand like the mountain drift," or down in the clear deep pools, where Bryopsis and Ceramia, Polysiphonia, Rhodomenia, and green silken Ulva form stately gardens for their pleasure, live a beautiful race of anemones of the high-born Sagartian tribe. To the eyes of the treasure-seeker there affords no fairer sight than Sagartia nivea *at home* in its native bower, in brownish olive or orange-coloured column, the upper part dotted with suckers, with slender tentacles and rippled disc of opaque white, as it waits with graceful bearing and outspread tentacula "for the meat that will come in due season," and presents a perfect picture of placid happiness.

But like some individuals, who can judge the mind by the face, the gifted Nivea at our first glance instinctively learns that our appearance bodes no good to him and his. And after some brave attempts to keep up a semblance of its wonted calmness and equanimity—the quivering tentacles alone betraying the terror from within—it slowly but gradually withdraws within its own walls: nor will it surrender its small garrison by gentle persuasion and coaxing. For, like some gallant little band who hold their own against fearful odds, and while each renewed attempt, each blow threatens death, still finds some new resource wherewith to prolong the struggle, so with Nivea, who, cognisant of one of the oldest stratagems of war, from the first attack pours forth such a plentiful supply of *acontia*, that a natural enemy may be easily persuaded that the ammunition is inexhaustible and beat a retreat. And when nooses and spears—barbed ecthorea—are alike unavailable, the suckers and prehensile base form so powerful a resistance, that ere the poor shaken citadel, completely enveloped in flags of distress, surrenders, it presents such an abject picture of misery and grief, that we feel like a ruthless savage impelled by the irresistible hand of destiny and research to molest these happy people.

And while Nivea is of a leathery construction and sufficiently strong in constitution to live long in a civilised hemisphere, yet it wanders restlessly to and fro, and ever wears the sullen bearing of a prisoner who eats and lives mechanically, rather than the free emigrant who, with his heart in his native land, still grows happy in the present, and if the simile is far-fetched, it is still apt. Nivea reminds one of a poor chained eagle, or a caged skylark who sadly trills—

"We are pressed by heavy laws,
And often glad no more,
We wear a face of joy,
Because we have been glad of yore."

SAGARTIA ROSEA.

Who would not give the meed of "Pulchræa gentis pulcherrima" to Sagartia rosea, with olive-

brown or pinkish-drab column, dark greenish-brown discs, and two or three rows of exquisite satiny, rose-coloured, bluntish tentacles, as its brilliant hue flashes on one's sight for the first time from within the darkened chamber and sanded couch that it loves best in the limestone rock? The light and warmth from heaven are grateful to its senses, the roar of the waters and the battling of the waves are sweetest music to its ears, and soothingly tranquillising to its comfort in activity or repose. The waifs and strays that fall to its share by the wayside strengthen its vitality, add to its stature, and clothe its whole frame in a thanksgiving to Him "who is I AM, even in the uttermost parts of the sea." But Rosea is one who brings a mind not to be changed by time; for invite him to your home, and *tears* at once pour from its satin smooth skin, and the white threads of sorrow and dismay clothe it like a winding-sheet. Gently and firmly you pass the steel chisel under a portion of its prehensile base, and fondly you imagine the castle is surrendering; but "This rock shall fly from its firm base as soon as I," says our resolute beauty; and by suckers and every available power it clings, and with the grasp and tenacity of a drowning man holds on to its much-loved home. We gain our end by bringing a portion of the rock with us; but, as La Bruyère says, we obtain our desire when it ceases to be of value to us; for, in spite of its leathery consistency and healthy-looking frame, the fair Rosea is a very Swiss with a *mal du pays* in our microcosm, and soon, very soon, it fades and droops, and ere long "a silent change dissolves the glittering mass."

SAGARTIA MINIATA.

wish I could say that Sagartia miniata is as bashful as the Brittle Star "Ophiocoma," who, rather than submit to the vulgar gaze of the genus homo, recklessly throws off his arms and legs. I fear Miniata's is a far stronger passion, for could an arrow from her quiver kill, few would survive who come to seek this pugnacious, cross-grained *gentlewoman* of her race—as luxuriating in her crystal drop she hangs pendent from the ceiling of her home in the beetling rock, or "sits high smiling in the conscious eye" in an arm-chair in an aqueous parlour, inhabited by queenly Dianthus, Viduata, &c. Various are the colours of Miniata's column—brownish-red, olive-green, orange or brick-dust, with a plentiful supply of palish suckers adorning the upper half, and disks and tentacles speckled like a bird's wing, in tints of red, brown, black, white, drab, or velvety-purple—of course differing in different varieties in colouring and marking.

Soft and delicate as Miniata seems in substance and construction, no Sagart is possessed of a stronger or healthier frame, or would live longer in a state of civilisation were it not for its irascible nature.

For like an angry reptile it stands upon the defensive, and is the first to begin the fray. A touch from even a camel's hair brush, however lovingly given, brings forth a shower of white thready darts, that dangle about its frame afterwards, a miserable example of ungovernable temper—that were it not for the strong interest Miniata cannot fail to excite in its prettily marked garb, and her quiet, well bred manners and simplicity when left to her own devices, I should be inclined to compare her to a scorpion, who sometimes destroys itself by its own venom; for more than once have I known instances of individuals, who, quite healthy at the time, have drooped and died after giving way to a fit of naughty ungovernable passion. By frequently finding Miniata able to come home with me, almost at the first greeting, and without the aid of a chisel or a fragment of her habitation to comfort her, I conclude that she loves to wander amid the garden walks and alleys of her native pools and bowers, as much as she delights in exploring the boundaries and mounting the glassy heights of her new home. With what delicate politeness and reserve she passes the castellated dwellings of her neighbours, avoiding personal contact with the most scrupulous nicety! Although I am bound to add that if by chance a stray hand—tentacle—should touch her in friendly greeting, up goes her back like a Highland terrier, and a tell-tale thread dangling after her proclaims that the civility has only been construed into an insult. Miniata perched upon the heights of the tank, with her straightened column just laved by the water, her tentacles expanded, and prettily begging for a morsel, which she takes and devours with the keen relish and contentment of a frank nature, or seated in the hollow of a pecten or cockle-shell, in peace and quietness—free to come and go as she chooses—like people who have a good position in the world, and the wherewithal to maintain it—Miniata's little weaknesses can be amiably overlooked, and she moves in her sphere with credit to herself and with sufficient admiration and notice to be considered a very worthy member of society and her face.

SAGARTIA TROGLODYTE, THE CAVE-DWELLER.

Having described the queens and gaily-dressed beauties of our small aqueous society, we come now to tribes who are born in far more lowly situations, and are what we shall term the artisan and rustic population of Sagartia Anemone. Although, let it not be inferred that the forms of the cave-dwellers and the mud are not as interesting and, in cases, as beautiful, as those of their race literally born to a higher or more elevated sphere. For as nature is no respecter of persons, and frequently decks the village belle with the fairness of the lily and the sweetness of the rose—or forms the desert flower, nourished by the dews and sunlight of heaven only, a triumphant rival to the palace exotic—so many a Bellis and many a cave-dwelling Troglodyte is a marvel of delicate loveliness. As is the varieties Rubicunda and Lilacina of Sagartia Troglodyte, with buff-tinted greyish column, longitudinal lines, and pale suckers, rich tinted rose or lilac-coloured tentacles, and a disc varied with black, white, and grey, in "a delicately pencilled pattern that has justly been compared to the mottling of a snipe's feather" (see Gosse's book on Sea Anemones), and that always in the normal species, and in many varieties, have at each tentacle foot a mark

like the Roman capital letter B; but these are artisans, "coaxed and dandled into eminence." The normal species of Troglodyte are clothed in tints of buff, grey, black, white, and red; and from the time they come out like buds from the parent stem, little miniature creations from a pin's head and upwards, who seat themselves on the soft, crumbling sandstone, or in the sand expand their saucy tentacles, and wait with exemplary patience for the morsel that will get a blessing with the rest, they are the architects of their own fortunes; for Troglodyte increases his possessions with his years, and a sandstone specimen who attains a diameter of an inch in column, two inches in the expanse of flower, and two inches and a half in height, may justly be termed a very Cyclops—or more aptly, self-made man of his race. With leathery construction, and constitution vigorous and healthy, Troglodyte is like the genus man, who must be sustained by food, or it will degenerate, and die.

"Ye who are wealthy a lesson learn,
Hear what the blessed Jesus said,—
Give us each day our daily bread,
And drive out want from the poor man's shed."

It seems hard to force Troglodyte to emigrate from his comfortable home, but as he is a classical animal, an island home is, after all, well suited to him; consequently he bears his translation with the calmness and contentment of a mind easily pleased and grateful for small blessings, and lives a settled domestic life, occasionally giving way to a fit of apathy and flatness, but coming out afterwards decked in neatest trimmest attire, and with renewed vigour and appetite, ready to exclaim with Ulysses, "I will drink life to the lees."

SAGARTIA BELLIS, THE DAISY ANEMONE.

Sagartia bellis, with straight, ungraceful column and flattened disc, dotted, not fringed, with tentacula, in the *ensemble* resembles a salver on a stalk, without a foot; and in pink and purple column, and disc beautiful in its hues of black, white, grey and blue—in scarlet pencillings and clear brown, white, and pink—or almost wholly white—reminds one of the awkward, stupid clown dressed out in holiday attire, for Bellis is a Sagart who loves the mud, and, like many of our poor brethren, thrives and grows apace in an atmosphere redolent of fumes, to say the least, not grateful to our olfactory nerves; for while there are varieties of the tribe who, like Rubicunda and Lilacina Troglodyte, are beautiful and elegant in form, and dwell in homes where "the pure and clear element gently is laving," yet the Weymouth Bellis, in yellow wainscot-hued column and black, white, and grey-freckled disc, and the Cornish, love to congregate in the slimy mud. Here they and their enormous families of little ones grow sleek and fat, laughing at care and its sister evils, for "He who made all things for His glory" provideth for them. "It is good to be contented," says Bellis, when you transplant him to a pure atmosphere. "I am cosmopolitan enough to be able to live anywhere, where such life as I have can be;" and so he accepts the morsels that fall to his share—chooses a residence which he seldom changes, gives no trouble, allows his arms to rust in their case, and drinking Lethe, says, "Oh, rest, ye brother mariners, we will not wander more."

I have many more pets in my microcosm. There are Devonshire Cup Corals, Carophyllia Smithii, who dwell in shelly homes and eat voraciously, but gratefully dress afterwards in white and pink, with, on rare occasions comparatively, a green brooch at their mouth; Balanophyllia Regia, the yellow Ilfracombe Cup Coral, who chokes over his morsel, like the old and toothless; Corynactis viridus, in my opinion but one degree removed from the Sagart Anemones, in sea-green garb, and a fringing of pinkish purple tentacula on footstalks, make pale fair stars to be admired, but clinging to their victims with a grasp that cannot be easily shaken off, and devouring like very cannibals; Serpula contortuplicata, who run up their winding staircases, on fifteen hundred legs, to come and exhibit their gorgeous and truly beautiful scarlet, or scarlet and white, and crimson fans and stoppers, seem to see without eyes, and vanish as quick as lightning. And lastly, there are pretty painted prawns, tame vivacious creatures, who row their pliers at our approach, and beseechingly seek for a "bit piece" with the pertinacity and humour of any black-eyed roving little "Arab" of bonnie Scotland; but for the present I have finished.

LINA.

PITY THE SORROWS OF A POOR BLIND MAN!

So I did. Who could help it? He was, to all appearance, not only blind, but perfectly helpless: an old man with a white head, and limbs all cramped and stiffened; bearing, placarded on his bosom, the above injunction. Let any one among us, who walks in the sunlight, taking his eyes as matters of course, cover them up for a moment, and think what it would be to grope about in a perpetual darkness,—not that he may give himself a gratulatory hug at his freedom from his neighbour's affliction, but that, feeling its magnitude he may pity it,—and he too would possibly turn and relieve the sorrows of the poor blind man, as the placard bade him do.

Every morning as I passed his corner I pitied him: that is to say, when I was not looking straight before me into my own business too earnestly to remember his. He never whined—a habit which would have set the teeth of my compassion on edge at once—and he never begged orally; only, he was there. Then I caught myself speculating about him. How did he get to the corner? How did he get away again from it?

A certain writer, instancing a difference between genius and no genius, takes two men passing an overturned waggon. The ordinary man, or no genius, simply sees the wreck before his eyes, while the genius immediately begins to imagine what it used to be, and how it looked before it was overturned. According to that view, let me flatter myself that I must have been a genius, since I got into a habit of making this poor old figure up afresh; calculating what he was like before he went blind; how long his legs had been

when they were straight, and how far apart his nose and chin when there were any teeth between them. But I never could find out how he got to his post, or from it. In some mysterious way he was there in the morning, always, whether I passed early, or late; and in the same mysterious way he was not there at night, but I never could attain to a sight of his manner of progression.

By-and-by, he became familiar with my voice; there would be a slight trembling of the eyelid, a wistful raising of his head in the direction of the sound when I spoke, and sometimes a mumbled blessing. For you see, I was weak about the sorrows of this poor blind man, and constantly ministered to them.

I began, indeed, in my interest for him, to make sundry inquiries into the nature of asylums for the blind, and to question him concerning his parish, whether he had any friends; where he came from, &c. But to these questions I obtained no other answer than the desponding upward movement of the head and eyelids, or else disjointed phrases, such as—

"No one to care for me—desolate old man—no, no."

More than once it seemed to me that my questions annoyed him; I put that down to delicacy of feeling, and was all the more anxious that something should be done.

One morning, however, I perceived new and touching symptoms of distress in the countenance of my blind friend. Not that he was demonstrative; he did not speak, but his attitude expressed the utmost despondency, and every now and then he quietly lifted the corner of a ragged handkerchief to his eyes. I noticed, too, that he got more alms than usual,—naturally, for no one could pass without being struck with the silent despair which seemed to hang about him.

Of course, I accosted him, and then his tale of trouble came out. His daughter was dead, and he had no money to bury her. This was his last visit to the corner; there would be no one now to help him along the crowded streets. He was old and crippled:—no help for it; he would not complain. Only let him get the money to bury his daughter decently, and he could die contented, for there was no one to care for him.

Some one among the pedestrians looked at us smiling, and whispered that it was "too old a dodge;" and with a momentary misgiving I slipped the usual small coin into the blind man's hand, and went on. But when looking round I saw big tears rolling silently down from the poor sightless eyes, I turned back, I could not help it, half-a-sovereign found its way somehow from my fingers to the cramped ones of the vagrant, and the usual mumbled blessing fell on my ears, mingled with an assurance that I should see him no more.

"Where do you go at night?" I asked, hesitating. He made no answer, only shaking his head slowly from side to side.

"Tell me where you are to be found, that I may see if anything can be done for you."

There was an odd twitching about his mouth as he muttered out that it was "no place for a gentleman to come to—no, no," following it up with more blessings. I persisted in my questions, however, and then, all at once, raising his head with the old uncertain movement, he said if I would tell him where I lived he would crawl there on his hands and knees, that he might thank me for my goodness.

So I went on my way and saw him no more; and very soon I left off speculating about the sorrows of the poor blind man, or expecting him to crawl on his hands and knees to thank me; the mist of business and time gathered over him, and he was "out of sight, out of mind."

One day as I was preparing to go out, a neat brougham drew up before my door, and a card was brought in to me, inscribed, "Mr. Valentine Brown."

I had no knowledge of the name, and I was in a hurry, but so, apparently, was the owner of it, for he followed his card without waiting for the ceremony of invitation, and stood before me bowing; a white-haired gentleman, elderly, but well preserved, and showing a remarkably good set of teeth as he smiled. Also a pair of wonderfully bright black eyes glistened through his gold-rimmed spectacles. As he did not speak immediately, I intimated that I had not the honour of his acquaintance.

"That," said Mr. Valentine Brown, indicating his card with a pleasant smile, "is the name by which I have been hitherto known. I am about to resume my real one. I have sold my corner."

Anyone will imagine that my mystification was not lessened by this speech and its singular conclusion. What possible interest could I have in the curious gentleman's "corner," whatever that may be, or the sale of it?

"I am indebted to you for many kindnesses," proceeded Mr. Valentine Brown. "Indeed, I may say that had it not been for the extreme interest—so extreme as to border on the inconvenient—you were pleased to take in my affairs, I might not have effected so early a retirement."

I was about to express my utter innocence of having been at all interested in the concerns of a gentleman who was an utter stranger to me, but Mr. Valentine Brown checked me with a gently dignified wave of the hand.

"I promised however to call upon you; I consider it only polite to repay your kindness by setting your mind at rest respecting my circumstances. I am retiring from public life, and have sold my corner."

Repeating this emphatically, Mr. Valentine Brown, by a quick movement, took off the gold-rimmed spectacles, and abstracted a complete set of teeth from his mouth. He then closed his eyes, raising his head in a wistful way which I at once recognised; twitched his eyelids and his mouth, and mumbled out a blessing.

And before I could recover from my amazement I was alone. A white-haired old gentleman was bowing and waving a ringed hand from the interior of the neat brougham, above the door of which, as it rolled away, I fancied—but it might have been fancy—I saw the top line of a well known placard—

Pity the sorrows of a poor blind man!

LOUIS SAND.

THE STEELYARD.

TACITUS (A.D. 62) designates London as famous for many merchants and the abundance of its merchandise. "Londinium copia negociatorum et commeatu maxime celeberrimum." This point of time from whence the authentic annals of London proceed was little more than a century later than the first invasion of Britain by Julius Cæsar, and only nineteen years after the expedition under Aulus Plautius in the reign of Claudius (A.D. 43), when Britain became subject to Roman domination. The Trinobantine metropolis thus becomes associated with the earliest of the cities whose resources have been maintained up to the present time, when, as regards its population and the extent of that commercial status the renown whereof originates with our earliest knowledge of its existence, it is admitted to stand unrivalled among cities of the modern world. The city of the Trinobantes, it is concluded, was situated on the slope which extends from St. Paul's churchyard to the site of Dowgate, and the contiguous wharf of the Steelyard. The name of Dowgate is derived by Pennant from Dwr, in the Celtic water, as water gate. The line of Watling Street probably still represents the main thoroughfare of the Trinobantine city, as it does the prætorian way of Roman Londinium. This appears to have proceeded from St. Albans, the Roman Verulamium, and entered London by way of Holborn at a gate on the site of the present Newgate, and reaching Dowgate, to have communicated by a trajectus or ferry with the road called Stoney Street in Southwark, which led to Dover and Richborough, the Ritupæ or Ad Portum Ritupis of the Romans, whose vast walls continue in the south, like the Picts' wall in the more northern part of this island, a noble monument of Roman intercourse. The position of London must originally have been one of considerable natural strength, being fronted on the south by the expansive estuary of the Thames, which is presumed by Sir Christopher Wren to have spread as far as the opposite hill of Camberwell, the embankments whereby it was subsequently curbed being still traceable, and which Wren considered to have been of Roman construction.

It must be noted, with reference to the site of the London of that period in contiguity to such a flood, that it had the disadvantage of lying considerably lower than the present level, and hence it may be supposed that it must have needed some strong embankment, to preserve the lower part of the city from immersion, and evidences of such a work have come under observation in the discovery of the trunks of trees closely rammed and interlaced with branches, so as to form a very effective barrier against the encroachment of the tide. The stream called Langbourne, which sprang from the marshy ground now occupied by Fenchurch Street, and the Wallbrooke, which rose in the marshes of Finsbury, and ran into the Thames to the east, with the river Fleet to the west of the city, and the marshes that bounded its northern side, sufficed to render its position nearly insular. Out of the limited river frontage thus circumscribed, the wharfs in question include a considerable space; and although history does not point to the precise locality of the trade for which London had become celebrated at the commencement of its annals, yet it carries us so far back as to justify the presumption that here was the original centre and focus of British commerce. Here, within the walls of the Steelyard, the Easterlings, or merchants of Almaigne had their port and their warehouses, according to existing documentary evidence, at least as early as the reign of Ethelred; and at this point the wealth of primitive Britain, consisting of wool, hides, tin, lead, and corn, was exchanged for the manufactured goods of the traders of Brabant and Flanders, who, having originally little or no superfluity of natural produce, were under the necessity of obtaining the raw material in return for the produce of their superior skill in handicraft. As until a period much later, we were not a ship-building people, the trade of London was for several centuries engrossed by the German merchants of the Steelyard, and the entire freightage to and from the continent carried on by means of their shipping.

Through Flanders and Brabant lay the high road to the old imperial capital north of the Alps,—Cologne, the Colonia Agrippina of the Romans—and it was evident that the merchants of the Steelyard were the medium by which we dealt largely with that city; but it is not until the reign of Henry the Second, at a time when Cologne was the largest and most prosperous city in Germany, that we find the record of a busy traffic between the two marts.

The mercantile alliance between this country and Germany was greatly promoted by the marriage of Maud, the eldest daughter of Henry, to Henry the Lion, the mightiest prince of the empire, and who held the two important duchies of Saxony and Bavaria; but, being ultimately subdued and driven into exile by Frederick Barbarossa, he forfeited all his lands except Brunswick and Lunenburgh, which were settled upon his wife, and found an asylum at Rouen and Westminster. A token of the kindly relation between England and Cologne appears when Richard Cœur-de-Lion obtained his release from the thraldom of Henry the Sixth of Germany, at the exorbitant ransom of 150,000 marks of silver. He passed through Cologne; and Adolphus Berg, the Archbishop, leading him into the Cathedral of St. Peter, in presence of a great multitude of knights and citizens, intoned himself the chaunt of the day, "I know that the Lord hath sent his angel, and hath delivered me out of the hand of Herod, and from all expectation of the people of the Jews." The king, in acknowledgment of this joyful reception, granted to the citizens of Cologne, in a charter dated Liège, February the 16th, 1194, that they should henceforth be free of a duty of two shillings a year, which they had been bound to pay as a tax to the crown for their Guildhall in London, and that they, without any restriction, should have the liberty to travel throughout his realm, and to sell and buy at all the market-places, wherever and whenever they pleased. It was in grateful remembrance of this boon that the bishop and citizens, a few years after, united to promote the election of Otho the Fourth, Richard's

favourite nephew, as King of the Romans, and on many after occasions stood manfully by him. In the meantime, Cologne had joined the great Hanseatic *Bund* which, following the example of an earlier union between the great towns of Flanders, had established a confederation of cities within the pale of the empire. The Hanse confederation obtained a settlement in London in the year 1250, their establishment being the premises of the Steelyard in Thames Street, where some remains of masonry of the 13th century are observable, and which have probably appertained to the chapel of the guild, built at the time of their taking possession of the premises. Henry the Third, in 1259, at the request of his brother, Richard of Cornwall, the "Kyng of Alemaigne," of the scandalous old song, granted them many valuable privileges, which were renewed and confirmed by his son, Edward the First, and additional privileges were conferred by the citizens of London, on condition of their maintaining one of the gates of the city, called Bishopsgate, and their sustaining a third of the charges in money and men to defend it "when need were." King John had previously, at the especial suit of his nephew, Otho the Fourth, issued the first letters patent to the merchants of the city of Bremen, afterwards one of the principal members of the Hanse union, securing them free import and export to and from England.

Among the royal and autograph letters of the thirteenth and fourteenth centuries in the archives of the Tower of London, is a curious letter addressed by the advocate, consuls, and commonalty

The Steelyard, Thames Street.

of the City of Hamburgh to Henry the Third, wherein those worthy magistrates, in a somewhat pugnacious vein, claim redress for the injuries sustained by a citizen of theirs—Master Willikin Kranee—from the inhabitants of Dunwich, one of the most flourishing ports in the eastern counties.

The extended monopoly of the English trade by the cities of northern Germany, had, in the beginning, excited considerable jealousy and opposition on the part of the Cologne merchants, who, on account of their ancient factory in Dowgate ward, claimed the exclusive right to English commerce; but, supported by Richard of Cornwall, the Hanse merchants stood upon their privileges, and the rights and properties of the Cologne merchants soon merged in those of their rivals, with whom they became united under the charter of Henry the Third, dated 1260, the united bodies being designated the merchants of Almaigne, who possess the house in London called the Dutch Guildhall—*Aula Teutonicorum.* In a volume preserved in the City, being a list of the mayors and sheriffs of London, called *Liber de Antiquis Legibus*, the following is narrated:

Soon after the martyrdom of Thomas à Becket, there came to his shrine, at Canterbury, a native of Cologne—Arnold of Grevinge, with his wife Odè, who, since their marriage, had continued childless. This couple fervently invoked the saint to fulfil their earnest and possessing desire, and to bless them with children, and promised if they were favoured with a son that he should de dedicated to the Church of Canterbury. Arnold settled afterwards in London, where Odè bore him a son,

Thomas, and a daughter, Juliana. Thomas failed to take the monastic vows, but joined the army of the Crusaders under Count Baldwin the ninth of Flanders, and assisted at the conquest of Constantinople, where, with his leader, he disappears from the stage, but Juliana became the wife of Thedmar, a native of the city of Bremen, and by him the mother of eleven children. One of these, born on the 9th of August, 1201, received in baptism the name of his grandfather—Arnold. He was destined to act for a number of years an important part in the affairs of the city of London, where he appears about the middle of the century as one of the aldermen. This worthy officiated for several years as alderman of the Teutonic Guild, which association, with his aldermanhood of the city, cannot but have been of the greatest advantage to the trade and privileges of the Steelyard. The policy of standing well with the civic authorities, induced the Hanse merchants to be liberal in their gifts, and, accordingly, on every New Year's Day, they presented the Lord Mayor with fifteen gold nobles (a coin of the value of six shillings and eightpence), wrapped in a pair of new gloves, in conformity with an old custom, as it appears, by the laws of the Saxon king, Ethelred the Second. They likewise presented the new Lord Mayor on his election to office with a keg of the best sturgeon, commutable into forty shillings, and two barrels of herrings, worth two nobles; and a hundred-weight of Polish wax, commutable likewise into forty shillings. Andrew Aubrey, who seems to have been a great favourite with the foreign merchants, received from them a voluntary gift of fifty marks. By means of these voluntary customs they preserved their own jurisdiction as emanating from an alderman whom they themselves had chosen. These politic merchants are found to be not sparing of their wealth in other payments and donations. They paid considerable fees to their own counsel, who were chosen from the serjeants at law; to the usher of the Royal Star Chamber, who with due formality was regularly invited to the annual festival given in the Steelyard, on the day of Saint Barbara (December 4th), a dinner at which a couple of magnificent codfish were considered an indispensable dish, to the Lord Mayor and Sheriff of the city of London, their ushers, and yeomen, and to the servants of the ministers of the crown, the Lord Chancellor, and the First Lord of the Treasury.

In the kindly intercourse maintained by the Steelyard merchants with their neighbours of the city, they make a buxom and gallant figure among the pageantry in which citizens ever delighted.

When Henry the Sixth returned in February, 1431, from Paris, a magnificent reception was given to him on his entrance into London, the Lord Mayor, Sheriffs, and Aldermen riding on horseback, in their purple and scarlet robes, richly lined with fur. John Lydgate, the rhyming monk of Bury, who describes this spectacle does not fail to include the German merchants.

And Esterlings* clad in her maneres,
Conveyed with the sergeauntes and other officeres,
Estatly horsed aftyr the maior riding,
Passed the suburbis to mete with the kyng.

But it is with the dis racted reign of this imbecile and ill-fated monarch, and the strife that ensued between the rival houses of York and Lancaster, that the reverses of the thriving community of the Steelyard begin to appear, and in addition to the drawbacks of an unruly and seditious time, the jealousy of native merchants interposed to their disturbance. Added to those adverse influences, great resentment was created by certain cities, members of the Union, by their reprisals upon some English traders who had committed a breach of the peace and disturbance on the high seas. At one time the English captured a fleet of 108 vessels belonging to Lubeck and to Riga houses, which being heavily laden with salt, were bound on their way homewards, just passing the Bay of Biscay.

In revenge, the large Bergen trading vessels of Lubeck infested for a considerable time the whole of the German sea, and seized many English galleys laden with cloth and other merchandise. These reprisals continuing, to the great detriment of commerce in general for some years, several ambassadors passed to and fro, but without much progress towards a settlement of the dispute. It was demanded, on the part of the English, that the merchants of Almaigne should pay the same duty on wine and wool which all other foreigners who frequented the English markets were subjected to. In 1469 they were condemned to pay a fine of 13,520*l.*, many members of the guild were taken into custody, and the privileges and the property of their establishment in London were in jeopardy of being finally seized. The rupture, when at the worst, was taken up by the English parliament, and Henry the Sixth brought about a settlement in a peace concluded at Utrecht, and ratified at Westminster on July 20th, 1474, by which their old privileges were restored intact to the Hanse merchants.

After riding out this storm at the imminent peril of foundering, the Hanse merchants contrived to steer their way amid the troubled waters of the Reformation, and enjoyed their civil and religious liberties nearly to the end of the 16th century. The great change, however, which ensued in the maritime character of the English during the reign of Elizabeth was inimical to the stability of the foreigners, and after Drake and Norris had taken sixty Hanseatic vessels, and in reprisal English residents had been expelled from Elbing and Stade, the German merchants were ordered to quit the Steelyard, by a royal writ dated January 13th, 1598. The property was appropriated by the crown as a depository of naval stores, but soon after the death of Elizabeth it was given back by contract to its former owners, on condition of their admitting, on similar terms, the English merchant-adventurers to the ports of Hamburgh, Lubeck, and other towns.

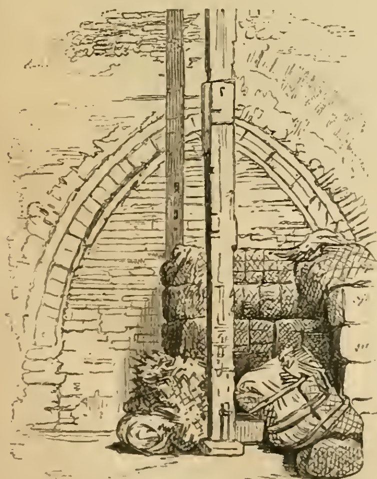
But it appears from some passages that the Steelyard privileges had previously been with-

* This designation of Easterling, by which the German merchants were popularly distinguished, originated the word sterling as applied to coin. The Easterling money was at the time much superior to the common English currency. It was likewise called silver of Guthrum's Lane—a neighbouring thoroughfare chiefly occupied by the gold-beaters, for whose purpose the German metals were in request.

drawn by order of Edward the Sixth, and this circumstance seems to have escaped the precise discrimination of Lappenberg — "*urkundliche* Geschichte des Hannichen Stalhopes," who gives a compendious history of their transactions. On the complaint of English merchants, called the "Merchant Adventurers," sentence was given that they had forfeited their liberties, and were in like case with other strangers (King Edward's Diary in Burnet, Feb. 23, 1551). Great interest was made to rescind this sentence, and ambassadors from Hamburgh and Lubeck came to the king, "to speak on behalf of the Stiliard merchants" (ibid. Feb. 28th). Their intercession was ineffectual. "The Stiliard men," says the king, "received their answer, which was to confirm the former judgment of my council" (ibid. May 2nd). This sentence, though it broke up their monopoly,

The Steelyard, A.D. 1543, from a Drawing by Anthony Van den Wyngrerde, in the Sutherland Collection, Bodleian Library, Oxford.

did not injure their Low Country trade in any great degree, and the merchants of the Steelyard still continued to export English woollen cloths, and to find as ample a market for their goods as the English merchants enjoyed. By this it would appear that their monopoly ceased in the reign of Edward the Sixth, and that by the order of Elizabeth they were further deprived of their factory in



West Door of the Chapel, Steelyard.

Thames Street. After this the Germans occuped only a portion of the premises for themselves, letting the remainder. They appointed a resident steelyard master, which office is continued to the present time. The buildings of the Steelyard succumbed to the great fire of 1666, after which calamity the Germans got involved in a string of legal suits, which, however, they contested stoutly, steadily maintaining their own as heretofore, and they were invested with a Royal Charter by King Charles II., with the right of erecting a church of their own close to the Steelyard, on the spot where a church had stood previous to the fire. This became the mother church of all the Lutheran churches and chapels in the metropolis. The name of the Steelyard may be deduced from Stapelhof or Staelhof, the house of the merchants of the Staple. In the Utrecht treaty of 1474 it

Badge of the Hanse Towns, in the Screen of the All Hallows Church.

is styled Staelhof. This seems a more likely definition than that of Stillyard, from the public beam and balance which was maintained there, and by which all goods were weighed on landing, in order to secure the king's toll. The Aula Teutonicorum of the thirteenth century was situated on the Dowgate side of the premises. In the thirteenth century it was the Hall of the Merchants of Cologne previous to their incorporation with the Hanse Merchants. Some remains of masonry of

Caen stone, with a large early English doorway, still exist in a building which seems to correspond in situation with a chapel-like edifice, which is shown in the large and remarkably fine drawing of London from the tower of St. Mary Overy's, in Southwark, taken in the reign of Henry the Eighth, by Antonio van den Wyngrerde, who accompanied Philip of Spain to this country on the occasion of his marriage to the Princess Mary of England. This valuable memorial of old London is dated 1543, and is preserved in the Sutherland collection of the Bodleian Library, Oxford. In this delineation the Steelyard premises extend considerably beyond their present area westward, and appear bounded by the wharf of the Vintry. Within this circumference, from the thirteenth century downwards, several premises had become included, comprising the house of Sir Thomas Salisbury, that of Sir Richard Lyons, another house given originally by Richard the Second to a follower of his Queen, Anne of Bohemia, and five houses in Windgose Lane, adjoining. In the sixteenth century the whole of the consolidated property was in the possession of the German merchants. The old hall was a huge stone building, with round-headed gates opening into Thames Street, which, with the walls by which the premises were enclosed, afforded the Germans a sufficient defence against the assaults to which in unsettled times they were liable as foreigners—always extremely obnoxious to the rabble of ancient Cockaigne. Over each of the gates was a Latin distich, that in the centre being ascribed to the paternity of no less a man than Sir Thomas More.

Hans Holbein painted in this country four famous pictures, besides many others of minor dimensions—one of them in the Hall of the Barber Surgeons, the other in the College of Physicians; the third and fourth were two large pictures painted in distemper in the Hall of the Easterling merchants in the Steelyard.

These pictures exhibited the triumphs of Riches and Poverty. The former was represented by Plutus riding in a golden car; before him sat Fortune, scattering money, the chariot being loaded with coin, and drawn by four white horses, but blind and led by women, whose names were written beneath; round the car were crowds with extended hands, catching at the favours of the god. Fame and Fortune attended him, and the procession was closed by Crœsus and Midas and other avaricious persons of note. . . . Poverty was an old woman, sitting in a vehicle as shattered as the other was superb, her garments squalid, and every emblem of wretchedness around her. She was drawn by asses and oxen, which were guided by Hope and Diligence, and other emblematic figures, and attended by mechanics and labourers. It was on the sight of these pictures that Zucchero expressed such esteem of the master. . . . The large pictures themselves, Felibien and Depiles say, were carried into France from Flanders, whither they were transported, I suppose, after the destruction of the company.—*Walpole's Anecdotes*, ed. Dallaway, i. 152.

Copies of them made by Verrio were in the collection at Strawberry Hill, and engravings of them by Vosterman exist.

A stately mansion on the river bank, now represented by a modern edifice, was the residence of the Steelyard master. Between the river and Thames Street was a garden planted with fruit-trees and vines, where the young Teutons might gambol, but dry-mouthed, for the act of plucking an apple or plum involved the heavy penalty of five shillings. An old tap, still in favour with the Thames Street carters and porters, flanks the premises on the Thames Street side, next Allhallows the Great. This represents the ancient Rhenish Winehouse, where, perhaps, Rhine wine continued to be drunk from the time when Henry the Second first sanctioned the free importation of Hock to the citizens of Cologne. Thomas Nash in his "Pierce Pennilesse, his Supplication to the Devil," makes a sluggard say: "Let us go to the Stiliard, and drink Rhenish wine." And in one of Webster's plays, we have, "I come to entreat you to meet him this afternoon at the Rhenish Winehouse in the Stilyard. Will you steal forth and taste of a Dutch bun and a keg of sturgeon?" Smoked ox tongues were likewise among the whets for which this house was renowned, which explains the allusion in "Nobbe's Bride," "Who would let a cit (whose teeth are rotten out with sweetmeat his mother brings him from goshipings), breath upon her vernish for the promise of a dry neat's tongue and a pottle of Rhenish at the Stilliards?" Blount even after the great fire attests the old-established reputation of the Steelyard tap. In his Glossography he says "the Steelyard was lately famous for Rhenish wines, neats' tongues, &c." A pleasing memorial of the German merchants is still preserved in the neighbouring church of All Hallows, where they attended divine service in the days of stout Queen Bess, being an oaken screen, among the carvings whereof their badge, the German eagle, is conspicuous. This was carved at Hamburgh, and presented to the parish by the Germans on being expelled their premises by the manful queen, in memory of old kindness and better days.

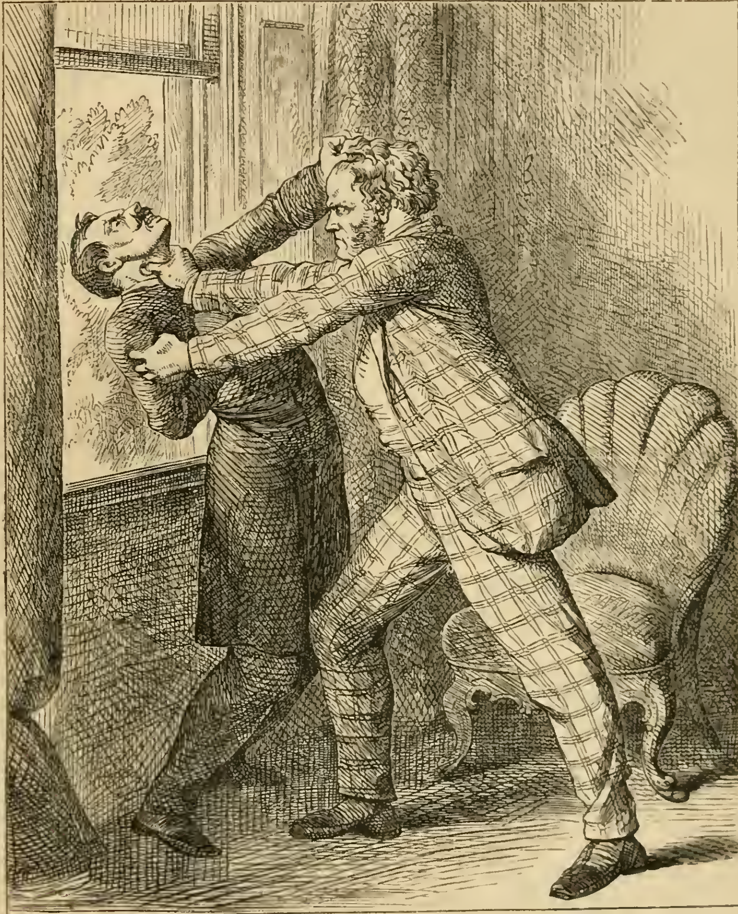
The Steelyard is about to become a thing of the past. The railroad surveyor, with his levels and rods, has cast the eye of destruction upon it. The premises have been sold by the senates of Lubeck and Bremen, in whose right it continued, and a railway, in continuation of the South-eastern line, will drive through its area to a projected terminus in Cannon Street. It is highly probable that when the excavations requisite to this project shall be effected, remains of great and curious antiquity may be revealed to rejoice the eye of the watchful antiquary.

J. W. Archer.

The Congress at Rhinocorura.—Epiphanius, the Greek father of the church, the same who forbade the reading of the writings of the far-famed Origenes. states (in his "Panarion Hæresium, 83"), that the first congress held about the division of the world was at Rhinocorura, where the three sons of Noah met, and divided amongst themselves all the countries of the globe, and which political act Noah afterwards confirmed in his will. The pious Philastrius (a contemporary of Epiphanius) goes still further, and counts the disbelief in the above division, and in its legitimacy, amongst the number of heresies: it is the 118th in his nomenclature.

THE SILVER CORD.

BY SHIRLEY BROOKS.



CHAPTER LXXX.

There is a crowd about the gate of the garden that is before the house in the avenue, but the people do not come nearer than the gate, for the police is there, and stern orders are given to stand away, and no one dares to climb upon the coping of the little wall, which, in England, would have long since been swarming with a double line of clinging gazers.

It is easy enough to keep off a well-behaved and obedient mob, but it is not so easy for the all-powerful police to enter the house, although they know that a fierce deed has been done there. The front door has been tried in every way, but the key inside prevents false keys from being used, and all the united force of the stalwart gendarmes has been brought to bear, but vainly. But the police are in earnest, and the crowd stands back as an officer passes out to summon the nearest blacksmith. Meantime other officers inspect the lower windows, but they are securely fastened with shutters, and to break in that way will require instruments.

They listen, however, and order silence in the crowd that they may listen the better, and the intelligent French mob instantly comprehends the object, and is hushed. But the police do not give sign that they can hear anything within. It would be strange if they could.

The officer has not returned with the blacksmith, and two Englishmen arrive hastily. These are Hawkesley and Aventayle. The crowd let them pass, and the former addresses a few words to one of the gendarmes, and is recognised and admitted, with his friend, before he has finished his sentence.

"Why does not somebody get a ladder, and go through a first-floor window? There is one open," is the prompt and practical demand of Mr. Aventayle.

But the police look coldly at the speaker, and prefer to do things in their own way. And here

comes their comrade with a working-man in a clean blouse. He had done his work, and was going out, but has seized two or three hammers and a wedge, and hastens in aid of the law.

The smith is brought up to the door, and looks at it and at those who have sent for him, and delays operations for a minute or two, and then removes his blouse, with the air of a man who is master of the situation. But the police have little patience with sentiment, and a sharp word, which calls up an angry glance in the man's dark eye, nevertheless quickens him, and he places his wedge on the hinge side of the door. An exclamation of approval from one of the officers brings a slight smile of contempt to the smith's lips.

"I suppose that you would try there," he says, pointing to the lock, "so that when you had broken the bolts, you might have the further pleasure of breaking the chain, if you could."

"How do you know that there is a chain?"

"Because I put it up myself, and was desired to make it strong, as the house was left to women, who wished to be secure."

"And are not the hinges secure?"

"I was not told to do anything to the hinges," replies the blacksmith.

They stood his blows, however, very well, and it was some time before he could make an opening for the wedge. It was gained at last, and the man struck hard, and the strong door began to give way.

Hawkesley was watching eagerly as the upper part of the door seemed to be yielding, and was ready to be the first to rush into the house, when Aventayle said:

"Surely she should not have come."

"She—who?" and Hawkesley turning, saw Mrs. Lygon making her way through the crowd.

He sprang away, and was by her side in a moment.

"I beg you not to come, Laura," he said. "This is no place for you. For God's sake stop away from the house. I will fetch you, if you will, when we have done."

"I must come in with you, Charles."

"You do not know what you are asking—"

"I must come in. You cannot understand why I say so—but you must let me come. All my life may hang on a moment's speech with him."

"With him,—with whom?" said Hawkesley, impatiently.

Before Laura could reply, Henderson hurried up.

"It is useless, it is wicked—you must not, madam, indeed you must not. It is too dreadful. Take her away, sir, for the love of Heaven. It is too dreadful!"

The girl's face was pale with terror, and her bright keen eyes shone out with a ghastly effect. She clung to Laura, and with gesture and earnest words implored her to keep back.

"I must see him," said Laura, in a low voice.

"You cannot, dear lady, you cannot. And if you—"

But a crash announced that under the blows of the smith, aided by the pressure of the other men, the door had given way.

Hawkesley was about to run back to the house, but paused to adjure Laura to wait his return.

"If you would only hear me for one moment, dear lady," implored Henderson. "Run in, Mr. Hawkesley, run in. I am sure that Mrs. Lygon will give me one minute."

He saw that the girl had something that she *would* say, saw that she would detain Laura, by force if needful, and he darted back, and hurried into the house.

The police had already rushed through the large room in front, and through the smaller chamber, and had found no one. Charles Hawkesley hastened up-stairs to the drawing-rooms, and as he reached the landing, a gendarme, followed by another, confronted him—they had ascended by the private stair from the room at the back, the stair down which Mrs. Lygon had been conducted to her hiding-place.

The next moment Hawkesley was in the front drawing-room. It was empty.

Not so the second room.

There were signs there that men had closed in a fierce struggle, and near the open window the carpet was torn from its fastenings as by the stamping and grinding of foot and heel—furniture had been dashed about in that wild strife.

But these were points for the police to note. Hawkesley saw none of them.

He saw only the dead body of Robert Urquhart.

There lay the strong man. Upon his lip was blood, but this had flowed, as was plain, from wounds self-inflicted, and when he had set his teeth grimly, in some access of fiery passion, now still for ever. But he had died by a single blow,—a blow that had been delivered truly, and home. It had been struck, and he had gone down. Across the place of the wound the fold of the loose coat had fallen, and it was not until one of the officers gently drew it back, that the tale was told. It was not told in the face, for upon the strong features had come a calm that gave them a loftiness they had rarely shown in life, and upon the bleeding lip there was almost a smile.

"That man has not died in the presence of his murderer," said, in a low voice, one of the officers—a soldier who had seen other deaths. "What is that gold in his hand?"

The hand was stiffening, but it yielded easily as yet, and Hawkesley drew from its clasp a small locket. It had been worn on a ribbon, which was broken, and there were specks of blood upon the glass, as if it had been pressed to the wounded lips.

Hawkesley knew well the fair hair of Bertha.

"He has forgiven her—forgiven her his death—but that was the least he had to pardon," said Hawkesley, his voice breaking with his tears.

But he spoke in presence of the dead only—the officers had dispersed on the traces of the assassin.

CHAPTER LXXXI.

Aventayle had lingered behind his friend, for, lacking the personal interest which hurried Hawkesley on to whatever sight might be in store for him, the former owned to a shuddering repugnance to encounter, needlessly, a spectacle

of terror. A few words from one of the men told him that a far other result than that which he had expected had followed the meeting of the enemies, and Aventayle, made yet more willing to be spared a terrible sight, gladly accepted the thought that he had better be the first to break the truth to Laura.

But she was gone.

"Had she been told?" asked Aventayle, hurriedly.

"Madame knows all, sir!" said, respectfully, a young man who came up to the Englishman. "The young person who was with her has conducted her home," added Silvain.

"That was kind and right," answered Aventayle, and he turned towards the house, and wished that Hawkesley would descend.

"Monsieur is a friend of Madame Lygon," said Silvain, earnestly.

"At least of her family—of Mr. Hawkesley."

"So I am informed; and it would be kind if Monsieur would deign to favour me with a few minutes of conversation."

Aventayle instantly assented; and Silvain, leaving a message for Mr. Hawkesley, the charge of which was instantly taken by half a dozen in the crowd, led the Englishman away to some distance.

Silvain briefly explained his acquaintance with the family upon whom this fearful misfortune had come, and if Aventayle had been in the mood for suspicion, the young Frenchman's manner would have dispelled any doubt as to his loyalty. He spoke with little restraint, and as one who considered his being aware of many painful circumstances was not now a fact to be apologised for, more serious affairs being pressing.

"I was desired to tell your friend what I am about to tell you, Monsieur, but it was afterwards thought that I might more properly confide it to yourself, to be again mentioned to him at such time as you may think best."

"I will do so," said Aventayle. "My God! what has happened? That man, whom I saw in all his health and strength in the court of the hotel, and now!"

"We may die for glory, we may die for duty," said Silvain, "but it is hard to die in vain, as that brave man has done."

"We have no right to say that of any death," said Aventayle, after a pause. "But these police, will they hunt down the murderer, or will they let him escape? and the people, why are they not encouraged to join in the hunt? Surely he has not had time to get far away."

"He will not escape," replied Silvain, "but the police will have their own way. Will Monsieur pardon me if I ask him to attend, for a short time, to what concerns tho welfare of the living rather than revenge for the dead?"

"Go on—I will do my best to bear what you say in mind. But I feel as if I had in some way been mixed up with this fearful business, and I am scarcely a free agent."

"We ought all to feel thus when a crime against society has been committed," said Silvain, who had read some books, and remembered something of what was in them. "But the crime will be punished, in the meantime let us attend to ourselves."

They walked on as he spoke, and quite beyond observation of those who had collected, and were rapidly collecting in the avenue.

"I would not speak much of the painful business which has brought you, Monsieur, and your friends to France," said Silvain, "but as I am to make you completely understand, I must suppose that you know that the person who is, doubtless, the assassin of M. Urquhart, had a secret which involved the reputation of two ladies. One of them is now a widow," he added, pointing in the direction of the house, "the other I need not name."

"I know all this—more than I desire to know."

"But is Monsieur aware of the business which brought the man Adair this day to Versailles?"

"I have some knowledge of it," said Aventayle.

"And I have reason to know that he was supposed to be about to rush into a very great peril, and that it was certainly not thought that he would leave that house alive."

Silvain's face assumed a warning expression.

"Pardon me," he said, "but that is far more than any man should say to any other man when such an event has happened. I will consider it not said, but Monsieur will do well to be guarded. I will only assume that it is understood that this Adair had a very important object in view when he came to the house of the late M. Urquhart."

"That I know nothing about."

"It was so, and I am to inform you of the circumstances, in order that M. Hawkesley may know them. Adair had in his possession a volume of letters which he produced to the unfortunate man whom he has slain, and these letters are the fatal evidence against the lady who—who is now dwelling in Versailles."

"*Had* in his possession, you say. Do you mean that he has not now got them?"

"That is the point to which I am coming, Monsieur. This Adair, of whom I cannot speak with too much abhorrence, was an agent of the police, and may still consider himself so; I have reason to believe that he so deludes himself. That he was so, however, is certain, and equally certain that he was for a long time here at Versailles, at which time, though he did not know it, he was as vigilantly watched as any person upon whom he had been ordered to keep his eyes. I myself had a share in observing him."

"Another agent of police," said Aventayle, drawing back involuntarily.

"Nothing of the kind, Monsieur," said Silvain, with some dignity. "In my own interest, and to repay certain wrongs, I availed myself in the single case of this man of certain offers that were made to me, but it was in this case only, and I shall never again undertake such a duty. When I tell Monsieur that I am about to marry an Englishwoman, he will probably receive my word as to the police question."

"Yes," said Aventayle, bluntly, "I do not believe that an honest English girl would marry a damned spy, and I beg your pardon."

"There is no offence, Monsieur," said Silvain, quietly. "I was about to say that Adair finally

discovered that he was watched, and became much more cautious, but not sufficiently so to attain his own ends. He did not really know who was observing him. But he did know that his papers were examined, and at times borrowed, and he was fully aware that none of the ordinary places of concealment which his own lodging gave him were of much use. He was a bold man, and he adopted a bold course."

"Yes?"

"The safe possession of this volume of letters was everything to him, for he intended to obtain a very large sum for them, and retire to England; and he informed me that he meant to become an actor."

"That is true; and I, who am a manager, was asked by the miscreant to bring him upon the boards."

"For the boards we shall substitute the scaffold, I doubt not," said Silvain, coolly. "He had, Monsieur, become intimately acquainted with the interior of the house in which he has committed this frightful crime. I need not remind you how it happened that he had the means of acquiring that knowledge—"

"I understand."

"But it was intimate and complete. And having this precious volume of evidence to conceal, he placed it in the very house of the man whom he had wronged, and in the very room in which the women whom he had so cruelly injured had been in the habit of spending their hours. That was very brutal, very atrocious."

The nature of Silvain spoke out frankly. He felt that the circumstance he was mentioning aggravated the crimes of Adair.

"Yes, Monsieur, there was a secret recess at the bottom of an almost secret well in a closet in that chamber, and there did Adair deposit his cursed proofs; there, where the dresses of the poor ladies must have touched within a few inches of his treacherous book. And, Monsieur, it was to fetch this book, a task that he would entrust to no other hand, that Adair came back this day to Versailles."

"Ha! To fetch this book of letters. And poor Urquhart found him in the house, and has been killed in endeavouring to arrest him?"

"How it occurred," said Silvain, in a tone that implied his desire not to be needlessly explicit, "how it occurred that M. Urquhart became aware of the intentions of Adair will no doubt appear when Adair is before the tribunal of justice. It is enough that they met in the house, and that Adair has bought his escape at the price of a crime."

"Taking the letters with him?"

"No, Monsieur."

"How do you know that?"

"Because, Monsieur, the letters had been removed from the place of deposit before Adair entered the house."

"By whom?"

"By a trustworthy person, Monsieur."

"Who retains them, of course," said Aventayle, instantly suspecting that a new bargain for the evidence was about to be offered. "Well?"

"You are doing an injustice to one who never injured you, Monsieur," said Silvain, reproachfully. "The secret that the letters were hidden in the well-hole became known to the young person whom I am about to marry. Unhappily she did not discover it in time to make the knowledge useful, but at least she was in time to prevent Adair from gaining a great triumph. She ventured into the house, and secured the letters."

"Well done. I beg her pardon for having wronged her in thought. Then Adair must have searched in vain for them, and perhaps, in his rage at the loss, attacked the unhappy man who has died by his hand."

"It may be so, Monsieur. I may believe that M. Urquhart entered the fatal house, intending vengeance upon Adair. But this may be known hereafter. The letters—"

"Yes, the letters, where are they?"

"They are in the hands of Madame Lygon."

"What!" exclaimed Aventayle. "Mrs. Lygon has got all the evidence against her—has got delivered to her without fee or reward what all the police in Paris did not seem likely to get at all? That is a bit of good news in the midst of our trouble."

"There will be neither fee nor reward, Monsieur, given or expected. The poor are not permitted many luxuries, but sometimes they may be allowed the luxury of doing good for nothing."

Aventayle had heard that virtuous sentiment in many a melodrama, but it was uttered by Silvain with so much propriety that it was impossible to regard it with disrespect. And the event of the hour had scared away all disposition to levity, at least in a mind like that of Aventayle. A harder man might have rallied sooner.

"And this is what I am to tell Mr. Hawkesley?"

"This is what I was desired to say."

"Out of evil—and it is dreadful evil—comes good," said Aventayle. "These letters arrive at an hour when we had no right to expect good fortune."

"Whether the recovery of the letters is good fortune or not," said Silvain, gravely, "others have more right to form an opinion than myself. I did not gather, Monsieur, from what has been said to me, that any great gain would arise to the lady who now has them, but it is something to have rescued them from the clutches of Adair, who would have sold them at a high price."

"He, at least, implied that they were invaluable to her," said Aventayle. "But this is, as you say, for others to decide. Have you more to say to me?—I should return to poor Hawkesley."

"You have not asked my name, Monsieur."

"I have not. I have been too much shocked to remember anything."

"Mr. Hawkesley may not know it, but it is well known to Madame Lygon. My name is Silvain, my shop any one in Versailles will show your friend."

"I shall not forget it."

CHAPTER LXXXII.

HE returned to the house, before which the crowd had now collected in large numbers, and it was with some difficulty, and only after an

appeal to the police, that Aventayle could make his way to the gate. The strangest stories were being exchanged by the people as to the fearful event, and the most distorted and improbable surmises seemed to receive the most favour. It would have been difficult indeed for the populace that stood before that gate to have imagined the true key to the mystery of the deed that had been done, but the wildness of some of the conjectures that were offered was extraordinary. One tale only need be mentioned, and this because its history is less mysterious than itself. It was distinctly affirmed by several of the crowd that the house was notoriously haunted, that the master who now lay dead had been the terror of the mountain region in which he had lived before coming to France, and that he had escaped to that country in the hope of avoiding the spectre of a woman who in early life had fallen a victim, first to his love and then to his hate. That he had fled in vain, and that having espoused a young and beautiful wife, he had compelled her to share his hours of despair, and to witness the approach of the spirit. That there was a winding stair in the house, constructed by the murderer to remind him of his castle in Scotland, and that it was up this stair that the spirit glided, at the hour at which the deed had been done, and fled down it shrieking, as the living victim, flying and praying for life, had done in the old castle. At length the poor wife, unable to bear such terrors, had fled to her home in England, but the murderer, though he had shut up the house, and endeavoured to leave it, had been compelled to return by the summons of the spirit, and, in madness, had at last died by his own hand. Those who may recall the device by which, when it was desired to exclude the domestics in Mr. Urquhart's employ from the lower portion of the house, the girl Henderson effected that object by a terrifying narrative, have the key to the origin of the story which was freely circulated among the crowd, and to which the female part of it was by no means indisposed to lend belief.

Aventayle was admitted to the house, but was requested to remain in the apartment below, while an official note of the circumstances attending the supposed murder was being completed. But Hawkesley was informed of his having come in, and hastened down.

"It is too fearful to think of now," said Hawkesley, holding his friend's hand. "What shall I say to you for having entangled you in such a terrible business?"

"Not a word, but tell me whether I can be of any use."

"I fear not, but stay. You went out to see Mrs. Lygon."

"She knows all and has been taken home."

"I know that, and you went away with Silvain, the lover of a girl who attends on Laura."

"You know him then? He is to be trusted?"

"Perfectly."

"He has given me a message for you."

And in a few words, few, considering the excited condition of Aventayle, he conveyed to Hawkesley the information Silvain had given.

Brief as the story was, Hawkesley heard it with an impatience that increased from the moment he comprehended the fact that the letters had been rescued from Adair's possession. But the excitement manifested by Hawkesley did not seem to be mixed with the gratification which Aventayle, who had formed his own idea as to the character of the letters, expected. On the contrary, Hawkesley compressed his lips, and paced the apartment hastily.

"I ought not to leave this place, Aventayle," he said, abruptly, "and yet I must see Laura."

"Is there such haste?"

"Yes—her impulse may lead her to—to do what will cause irreparable mischief—and yet to leave *him*, while the officers are making these perquisitions—I must go, however."

"Surely, Hawkesley, you can write, or send such a message by me as will save that necessity?"

"That is true—and yet, unless you comprehend all—but I must not leave that poor, noble fellow in the hands of strangers. Aventayle, find Silvain again—that you can easily do—and make him take you to Mrs. Lygon's lodgings. Say you came from me, and she will, I am sure, see you. But if she is actually too ill to see you, and nothing else will prevent it, speak to the girl, Henderson. She is to be trusted. This is the one message, the solemn charge from me. *Do not destroy one line, as you value all that is dear to you in the world.* Not one line—impress that on her, Aventayle, and say that I came from the dead man's presence, released the dead man's hand, that I might send her that charge."

Silvain had mixed in the crowd, and with a certain scorn, as one who knew the history of the fable, listened to the fiction which has been mentioned.

"It is entirely untrue," he said to a matron who had just finished her version of the story. "The man who lies dead in that house was a brave and noble man."

No one contradicted him, for he spoke almost angrily. But as soon as he had, in obedience to a signal from Aventayle, joined the latter at the outside of the crowd, another matron remarked—

"Of course he will say so. It is his duty. He marries a girl who came from England, and knows the frightful secret."

"She has seen the spectre," affirmed another woman, half terrified at her own speech.

"My son wants a wife," said a third, "but sooner than he should share his bed with a girl who has seen a foul sight like that, I would gladly dress him for his bed in the ground."

Aventayle, under the guidance of Silvain, soon reached the house in which Mrs. Lygon had her apartments.

"I am sure that she cannot see you, sir," was the reply of Henderson. "I hardly dare take the message, but I will venture, as you come from Mr. Hawkesley. At least I will knock."

Mrs. Lygon could see no one—"would see no one," had been the answer to Henderson.

And no inducement, not even Silvain's support of the request, would induce the girl to go up again.

"At any other time," said Henderson; "Sil-

vain knows that I am not easily daunted, and I would go in a moment. But not now. I have never seen her as I have seen her to-day, and there is cause."

"But under any circumstances Mrs. Lygon *must* have the message I bring. You, who have done so much to serve her, will simply be undoing all the good you have done if Mr. Hawkesley's message is not delivered to her."

"You hear this, dear Matilde," said Silvain, earnestly.

"I tell you," said the girl, in a low voice, "I dare not. That is something for me to say."

"Tell me," said Aventayle, "what is Mrs. Lygon doing?"

"*You* know, sir, what has come into her hands to-day."

"Yes, yes, and that must be what Mr. Hawkesley specially means. What is she doing?"

"*Now*," said Henderson, still in a low voice, "she is reading page upon page of handwriting, with her face in a flame, and with the hot tears coming down like rain, but, for all that, the last time I looked into the room, her eyes glared at me like coals of fire. I will not go in again."

"You do not know what mischief you may be doing by your fear," replied Aventayle. "I must speak to her myself, if it is outside her door."

The tapping of a foot was heard in the room above.

"That is for me!" exclaimed the girl.

"Ask her to admit me, if only for a moment," said Aventayle, hastily, "but if this is impossible, say this,"—and he gave Hawkesley's message.

In a few minutes Aventayle was requested to come upstairs.

Laura was seated at her table, and before her lay the rescued volume—the volume which we have seen but once—when Ernest Adair laid it in the hand of Robert Urquhart. Some hand had torn from it several leaves, but they were still there.

"I am just in time, it seems," said Aventayle, pointing at the volume.

"I am sorry to have sent you down what must have seemed a rude message," said Mrs. Lygon, "but I was very much occupied, and I did not recognise your name. A friend of Mr. Hawkesley's ought not to have cause to complain of incivility from me."

Where is this face of flame—where are these coals of fire? thought Aventayle, as he looked at the beautiful and self-composed woman before him, and listened to her excuse, offered in the tone of the drawing-room. And yet, after what has happened to-day, what right has she to be so calm? She ought to be agitated. I do not like this woman.

And so hath been judged, and so will be judged until the day of the one judgment, when, for the first time, justice shall be done on earth as it is in Heaven, many a cause that is but half understood.

"Has your servant conveyed the message which Mr. Hawkesley begged me to deliver?"

"I scarcely understood it. But now that I think I understand it, from what you said at coming in, I will only ask you to say that my brother-in-law's wish shall be obeyed to the letter."

There was something of triumph—it was but a little—but it broke out in spite of the well-ordered features, and the calmness of tone.

"That nothing will be destroyed?"

"Nothing," said Laura.

She laid her hands upon the book, as if to guard its contents against all the world.

"My errand is done," said Aventayle, "and it will be my apology for my intrusion." He was about to go, when she took his hand.

"You have come in all kindness," she said, in a low voice, and with agitation, "and you ought not to be sent away with the thoughts that I know are in your mind. But bear with me, Mr. Aventayle. You cannot know what the day has brought to me. Have you any children?"

"Indeed yes," said Aventayle, "God bless them!"

"Then you *can* understand—but I must not talk to you so," she said, trying to smile as tears forced their way—"I have no right to talk to you. Only, if you had seen a black wall rise between you and those children, and day by day grow stronger and blacker, shutting you away from them for ever, and then there suddenly came to you—we have such things in dreams,"—and again she tried to smile, "a hope that the wall was crumbling away—you would know how to bear with a mother whose heart was nearly breaking, but who believes that the black wall is coming down. God bless you, and thank you for bringing me Charles's message, but there is no fear of what he seems to fear—assure him of that."

Again she held out her hand, and he pressed it and went down.

"A word, my good girl," said Aventayle, when he found himself with Henderson. "Did I understand aright that Mrs. Lygon had been informed of the dreadful thing that has happened to-day?"

"Silvain told you so, sir, did he not?"

"Yes."

"He was right to tell you so, but it is not true."

"What do you mean?"

"We did not dare. And she thinks at this moment that it is Adair who has been killed."

"I thought it must be so. Keep the truth from her until her present excitement is over. I thought it must be so. Mr. Hawkesley shall come up as soon as he can leave the house. By all means keep the truth from her."

The police had examined the whole building, and had easily detected the mode by which Ernest Adair had entered. They found the traces of his feet, and those of the unmistakeable foot of Urquhart, but in the mould of the bed between the wall and the window, they also discovered the marks of a third person's tread. The shoes had been well made, but must have been those of an artisan or other member of the humbler class of society. This fact remained to be explained, and was much debated by the police.

There had been but two men who could have explained it, and one of them could bear no more witness in this world.

The other was a mechanic who had mingled in the crowd, had remained in it, but silently, during all the proceedings, and had spoken but once.

That was when Silvain, having listened to the charges which were so wildly advanced, and to the strange story of the spirit, had indignantly broken out with his declaration that he who had been slain was good and noble.

"He was both," said the man, with a deep oath. "And he has died by the hand of one whose head is the due of the executioner. God willing, the debt shall be paid."

The people looked at him strangely, and he went away.

(*To be continued.*)

DEATHS BY FIRE.

When a hermit, in our day, retires to a mountain, to spend his latter years in the repose which befits declining strength, his out-look from his retreat is very unlike that of the ancient hermit. In the dusty tombs of the Thebaid, where there were scorpions under the stones, and crocodiles in the river below, and jackals made the night dismal with their cry, and no green thing was visible for the greater part of the year but the sombre palm and the scanty foliage of the thorny acacia, the recluse did not want to know anything about the world, or his brethren living in it. He might not object to have somebody come now and then to admire him, and tell him how holy he was, and how wise he must be; but he was far too wise and holy to condescend to learn anything in return, or to suppose that a mundane visitor could have anything to tell that could be worth his listening to.

So it was with the somewhat more comfortable dwellers in the limestone caves of Syria. They must have had rather less to endure, though the heat is quite severe enough between Jerusalem and Jericho; and the winters must have been cold in the windy caverns of the honeycombed limestone; and there were storms and floods which the Egyptian hermits never knew. But the valleys of Syria are green almost all the year round, and the terraced hillsides sustained herds and flocks, and there were people within call almost everywhere. The Syrian hermit might, I suppose, abjure his kind if he pleased; but he was not so far out of the way of them as his brother on the Upper Nile. Still, it was a point of piety and pride to forget life and the world, or to strive to do so; and thus the old hermit could have no interest in the events of the day, nor anything to say on them which was worth anybody's going far to ascertain.

The case has always been the same with monks and nuns of all denominations—well-meaning persons who consider spiritual prudence a virtue of the highest order, and who are therefore not likely to take large and genial views of human affairs. In this respect they are all pretty much alike—whether they are dressed in yellow, praying by wheel on a Thibetian mountain, or dressed in black or grey in a Spanish or South American convent; or dressed in white, grey, or black in some holy seat of sisterhood, where no pleasant feast ever greets the senses, no gay music cheers the spirits, and no news ever arrives to gratify the needs of feminine sympathy. None of these have ever used their mountain perch as a station whence to study human life. There are other classes of persons too—and not only princesses and their attendants—to whom life itself is made a sort of Happy Valley, where they are encouraged to occupy themselves with such pleasures as they are capable of, without thinking of wishing to know anything that lies outside. Of recluses like these there are multitudes in every highly civilised country. They are present wherever luxury and pride have grown up, and knowledge has not overtaken them, as we all hope it will some day. These people, however, are not conscious of their seclusion from genuine life. They take *their* world to be *the* world: and as long as they do that they will not arrive at much understanding of human affairs, or interest in them.

Very unlike all these, ancient or modern, is the old man of our time who has not strength for such strenuous life as that of our cities, and therefore retires to a lodge on the mountain, whence he may survey the past and the present at once, and, by observing and reflecting, come to know more of the world than when he lived in it. There is the press now-a-days, instead of the costly and scanty parchment literature of the early ages. There is the newspaper, which satisfies all yearnings after gossip. There is the post, which now reaches every man who can read a letter. There is the telegraph, which publishes interesting news more rapidly than the king's riders or the fiery cross could carry it four centuries ago. Thus, when there is the inclination to look on, as human affairs are transacted, the recluse can do it in a way which was not possible of old. The hermit also has leisure, which the man of business has not, to set down his thoughts on what is interesting other men; and if what he sets down is worth other men's reading, in odd moments of leisure, he may possibly find himself privileged to do something for somebody's benefit, after he seemed to have gone out of the way of it. Such is the view of a hermit of 1861: and, unless his mountain air has intoxicated him, or distance has made him confound his dreams with the actual movements of mankind, he will venture to discuss, from time to time, some topic of the day in which he is in sympathy with society, or some considerable part of it.

The sympathy of society is roused, but too many times every year, by the Deaths by Fire which take place in perpetual succession. It is a question with many whether there are more or fewer deaths by fire than in an earlier stage of the world's civilisation. Now that all England is mourning Mr. Braidwood, and that many families are privately aghast at the horrible fate which on the same occasion has overtaken some member of the household, in pursuit of duty, or of gain, or in the apparent wantonness of chance, there must be a multitude of persons thinking and talking of death by fire, and most of them, probably, regarding it as one of the chief disgraces of our civilisation. We do not now burn towns in warfare, as our forefathers did. We

do not roast a tribe of aborigines in a cave, as has been done in Africa in our own time. Men are not now burned at the stake for their opinions, —unless in some of the American Slave States and in Cochin-China. Kings and courtiers do not dress up in skins and pitch for a masquerading dance, and catch fire from torches, like the unhappy Charles VI. of France, and writhe in the torture of the damned. Yet it may be doubted whether a larger proportion of the present generation does not die by fire than in the ruder times of old.

Up to this Midsummer we should have said that we were past the danger of such conflagrations as the Fire of London: but to-day men speak less confidently of that than they would have done at any time in their lives before. It seems to be agreed now that a very slight change of circumstances might have laid London (the city) or Southwark low at Midsummer 1861. We have witnessed several great fires within one generation. The Hamburg fire is of itself a warning against security in modern civilisation. Where wooden houses or thatched roofs are in use,—in Russia, in Norway, in Switzerland, in the French provinces, in our colonies, and in outlying villages in our own counties, great fires are always happening somewhere. We do not forget the monstrous Canadian fires, making a clean sweep of the lower part of Quebec, and of half or a third of a town, here and there. St. John's, New Brunswick, is subject to fires almost periodically, like an individual here and there who has a terrible fever every seven or ten years. The two New York fires of a quarter of a century ago will never be dimmed in their impression on the minds of those who witnessed either of them.

There are many persons now living who say that no desolation that ever they witnessed can compare with the scene when those fifty-three acres of calcined ruins lay crumbling, after the smoke had at length gone out. In the midst of the white, powdery heaps of ruin, stood up aloft a singularly ugly building;—a tall and narrow fire-proof warehouse, with iron doors, behind which was a store of hay, absolutely unsinged. By this token, our Tooley Street fire was more severe; for fire-proof warehouses, with their double iron doors, were overpowered at last;—the walls and floors calcined and the doors red hot, so that nothing behind them could be preserved. It should be remembered that civilisation may intensify fire as much in one direction as it restricts it in another. Two centuries ago, narrow streets of wooden houses caught like rows of gas jets, blazed up, and were soon mere heaps of wood-ashes; and the more substantial warehouses contained nothing like the mass of combustible substances that our modern commerce accumulates in one place. Probably, no port in the world then held so much tallow as choked the sewers, and flooded the streets, and blazed across the river at the Tooley Street fire, and went on burning in the vaults after it: and oils were a rare commodity in the days of the Stuarts to what they are now.

We cannot but perceive also that there is something much more barbarous and shocking in the deaths yet known at this recent fire than in the few which happen when slight wooden houses or rows of thatched cottages are consumed. Men in boats burned on the Thames like moths in a candle, are a worse spectacle than we had fancied ourselves exposed to in these days. The flame spreading as the ignited tallow or oil spread over the surface, till it surrounded a boat filled with tallow, and set fire to it; the men in the boat, doomed and seeing their doom, but plunging overboard into one sheet of burning grease to avoid the same agony within the boat;—this sight of horror, witnessed by the glare from the shore, could not be surpassed by any spectacle of old days,—nor equalled, unless by the vindictiveness of war, which drove back enemies into a burning house at the point of the lance.

Whenever there have been conflagrations, there have been deaths by crushing under walls; but the massive walls which we build as a protection against fire are more dangerous than the wooden erections of our fathers, and make a more total destruction when overthrown. In a region of log or frame-houses, Mr. Braidwood would not have perished as he did: but then, again, such a man would not have been engaged in his special duty. In the newly settled American States, and also in Swiss villages, where wooden dwellings and stores exist, the proceeding, in an alarm of fire, is to pull down the logs or planks with hooks, and put out the fire, or let it burn piecemeal. When we build massive walls, in fire-proof warehouses, we do what we can to repel the calamity of fire; but, if the fire once gets the upper hand, the danger from the walls is greater than ever before.

There is an air of fatality about such an incident which reminds one of the revolting accumulation of calamity which renders fire after an earthquake or a railway accident so horrible; or, I may add, a conflagration in an American forest or prairie or on a Russian steppe. We are given to understand—and we scarcely need to be told it—that there is a feeling of despair, a sensation of being hunted by fate, in such circumstances which is, of all human experiences, the most terrible. When the earthquake has levelled every house, and imprisoned the inhabitants in the ruins, the worst has yet to come. Fire bursts forth wherever air penetrates, and consumes the life and property that the convulsion had left. At Mendoza, a few weeks since, this was the surpassing horror, as it was in the great Lisbon earthquake.

Most of us remember the railway accident between Versailles and Paris, nearly twenty years ago; and the prominent image in that terrible scene is still the lady—name unknown—who perished in full view of a crowd who could do nothing to help her. She was fixed by the waist (apparently without pain) between two parts of a carriage, and when she became aware that fire was the danger, she at first called wildly for help. When she saw that it could not be rendered, and when her light scarf caught and flickered away, she gave one gaze upward, buried her face in her hands, and stirred no more. Many times since has fire followed the crash of collision till it is naturally almost the most dreaded of the two.

Perhaps even these are not such appalling events at the moment to the sufferers as a forest

or prairie-fire. The leaping of the flame from side to side, the capricious ignition far and near, and rapid race of the yellow darting flames, the roar of the fire in the woods, the kindling of great trees as if they were torches, and the flare-up of small ones, shrivelled, burnt, and gone in a minute, and the lowering smoke, which seems to make the wood a burning prison—all these are enough to make the stoutest heart stand still. But the prairie-fire is worse, from its overwhelming speed, which paralyses the imagination, and delays or precludes all rational attempts to escape. There are but two ways: to burn the grass in front soon enough to have it sufficiently cool to pass before the greater fire comes up; and to plunge into water sufficiently broad to admit of breathing amidst the smoke. The rush of animals of all kinds adds to the terror. The wildest are not likely to be mischievous at the moment; but the sudden crowd of beasts, birds, and reptiles, all in terror, and most making for the water, where there is any, is enough to give the sensation of the world coming to an end. When travellers die, in such a case, it is evidently from suffocation—a rapid death at least. When they are saved, it is by going through something very like suffocation, by keeping even their heads under water as much as possible till the smoke and heated air roll off.

In regard to such extensive fires as these, which menace life on a large scale, the natural question is, whether our advanced civilisation cannot cope with their forces. But for the importance and the urgency of this question we could hardly bear to dwell on the subject at all. The answer seems to be that our civilisation introduces new perils, while enabling us to deal with some old ones; and the conclusion is, that the loss of life by fire is still shockingly and shamefully large. Our gas, our explosive compounds, so much more in use than formerly, our lucifer-matches, which nothing can keep out of the hands of dunces and children, and our vast stores of inflammable goods, have increased our dangers from fire at least as much, we are told, as science and skill have lessened them by lightning-conductors, fire-proof buildings, fire-brigades, and water-works, and other devices. But it is comfortable to reflect that we are more likely to be guarded than imperilled by further scientific and practical development. We may surely learn to manage our gas and other explosives better. As popular education advances, there will surely be less folly in the management of dunces and children; and there is, I believe, a strong impression abroad that, though Phillips' fire-annihilator has not yet proved anything like a match for the great conflagrations of our day, it intimates the true principle of antagonism to the evil. If we can learn to administer at pleasure any substance or action with which combustion cannot co-exist, we shall have the mastery presently. Men used to suppose that water was the true agent. Poor Laura Bridgman—the girl without eyes, ears, or sense of smell or taste—could not make out why people let a fire go so far as to cause the engines to rumble over the pavement. She asked why somebody did not blow it out, having understood that people blew out a candle. That blowing should put out a candle and make a house burn more fiercely puzzled her; and in like manner it was puzzling to people in possession of their five senses that water, which extinguishes a moderate fire, should aggravate a fierce one. As it does so, it directs us to search for substances or forces so antagonistic to combustion as that we have only to bring them into some practicable form for use on the breaking out of fire. To have Phillips' fire-annihilator is better than to have no resource, and especially in places where no system for the repression of fire is in action; but the great use of the invention will, no doubt, prove to be as a suggestion of the right direction in which to work towards a remedy of one of the greatest calamities of human life.

After all, the greatest loss of life by fire is not in these conflagrations of cities, or even houses, but by accidents to individuals. These accidents are almost always owing to imprudence; but, as they are very frequent, and belong to particular customs and the use of particular implements, it is better to look to the customs and implements rather than scold the imprudence. As long as we have open fires in poor people's homes there will be burnt children; as long as tipsy tramps carry lighted pipes into hay-lofts and stables there will be inquests on dead tramps and fires in outhouses; as long as women wear hanging or protuberant sleeves and balloon skirts there will be inquests on young ladies and housemaids. The fatal instrument, however, which destroys more life than the parlour or kitchen or nursery fire is the lighting apparatus—from the rude torch of barbarous times to the latest; or, perhaps, we may soon be enabled to say, the latest but one.

Those old torches must have been extremely dangerous,—as indeed they are now in the rural dwellings of Norway, where it is the business of one person in the room to light and renew the slips of resinous pine-wood, which burn out in a few minutes, dropping sparks whenever moved, and with every breath of air. Candles must have been dangerous in days when the floors were strewed with rushes, or sprays from the woods. By King Alfred's lantern we know how the draughts in the ill-built houses of that age wasted the candles; and the same winds would blow the sparks about. Some Americans now attribute the frequency of fires in their country partly to the haste, and consequent imperfection of house-building, by which chimneys set fire to the whole dwelling, and yet more to the use of wood for fuel, and the consequent carrying about of wood-ashes, which are singularly treacherous in their concealment of fire. These causes were in operation when King Alfred put his candles into a lantern, to make them serve at once as a light and a clock; and those who did not so protect the flame, and preclude sparks, no doubt suffered much from fire.

Candles have, however, lasted from that day to this. Ours is probably the last generation which will be able to say as much; but at present it is true. In each age there have been other lights. There have been cressets in the streets, and courts, and inn-yards; and lanterns in the hands of people of all degrees. There has been a burning

of oil in lamps, ever since men caught large fish, or crushed seeds on a large scale. Cressets, lanterns, and oil-lamps have all given way before gas in the open air, and in large edifices, shops, and even private houses; yet has the old-fashioned candle remained—sometimes with an air of new-fashion about it—to this day. The candle, with all its barbarism, its grease, its snuff, its waste, its clumsiness, and its dangerousness, has kept its place with a pertinacity which future generations will wonder at.

Its approaching extinction has been foreshown by a long series of endeavours to improve it. In the same way, we strove to improve our street lamps, when old men like myself were boys. When a lamp of a certain sized wick did not give light enough, we added threads to the wick. We cleaned the glass oftener; and spoke sharply to the lamplighter; we found fault with the oil; and then we again added threads to the wick. Some people hinted at a new method altogether, and pointed to little boys getting a brilliant flame out of a coal in the fireplace through the bowl of a tobacco-pipe; but Sir Humphry Davy said, publicly, that that was all nonsense, and that when we could bring down the moon we might light the streets with gas, and not before. So most people settled their minds to their oil-lamps, and preached content. Yet lighting by gas followed. For many years we have, in like manner, been improving candles. The improvement is real; but not the less must the candle go out before a better flame.

The old candle-drawer of the housemaid is seldom to be seen now, happily. Most households have done with that abomination,—the greased sheet of brown paper, the scrapings of tallow, and shreds of snuff: the filthy glove, and grimed and greased snuffers and candlestick. But in too many kitchens, the cook still has to deal with tallow-candles; and the housemaid has only exchanged tallow for composition or wax. The improvement is great; but there is still more or less dirt; the substance, whether fat or waxy, still runs down when the wick flares; and there are droppings all over the house where any sort of candle is carried. Above all, the danger to life is scarcely at all lessened by any improvement in the quality of the candle. If an expiring mineral wick is less dangerous than the old cotton one, in one way, it is more so in another. In getting rid of the stench, we have lost a warning.

Everybody knows all this, I may be impatiently told; and that is the reason why we have had such a series of domestic lamps for many years. This is true; but the lamps have never superseded the candles, as the candle-makers can show. And no wonder; for the many varieties of oil lamps, up to the date of camphine and naphtha, had little advantage as to sweetness and cleanliness over the candle; and then the camphine and naphtha lamps were denounced as dangerous.

For centuries lives have been lost every year, every month, perhaps—including the whole world—every hour, from something flying against the candle, or sparks from the candle falling upon something. People reading in bed, or falling asleep over a light; men in nightcaps, women in large sleeves, children in pinafores, have all been victims by hundreds. Linen on a drying-horse, a muslin curtain in a window, rags or paper in a closet, waste cotton in a warehouse—anything to which a candle was brought near, might, and did sometimes, cause somebody's death. Yet we have perhaps heard more outcry since camphine and naphtha-lamps came in than in all the old days of candles. This is not surprising, for accidents have been frequent and very terrible. I have observed in the American newspapers, in particular, a long and steady warfare against this invention, with an occasional publication of the number of deaths caused by it. The answer is twofold. The Americans use camphine and naphtha in small hand-lamps, which are easily upset. This is rash. But in regard to the use of camphine and naphtha in standard lamps, it is safe if the simple rules are observed,—to feed the lamp by daylight, and never to carry it lighted. If carried lighted, it may be dropped; and we know how a housemaid was burned to death in ten minutes, a few months since, by that particular accident. She dropped the lamp, trod on the burning fluid, with the notion of stamping it out, set fire to her under-clothing, and was lost. It is abundantly easy to trim the lamp in the morning; and, if left till after dark, the person who holds the candle while another pours in the fluid is regularly amazed, when an accident happens, at the distance at which it can catch fire.

With camphine we might get on very well in drawing-room or shop; and nobody could be burnt but by criminal rashness: but till recently there has been only the candle, or the unsavoury oil-lamp for the kitchen and bed-rooms, and for going about the house. Now, at last, we seem to have got hold of something which gives us all the good, and none of the bad, of former methods; and we see accordingly whole villages and towns leaving off candles and taking to photogene-lamps. In primitive country towns the tinmen cannot make lamps fast enough for the cottages and kitchens, and shops for miles round, and, cheap as photogene is, its price rises from the vehemence of the demand. I hope it is true, as we are told, that the fluid is harmless if spilt. It seems to have every other virtue, and it is really a pleasant thing to see the change in humble dwellings, as well as to note the increased safety in richer households.

We can now leave a light burning in a chamber without danger as without cost, by turning down the photogene hand-lamp to a mere glimmer, and there are neither sparks nor droppings on the stairs. Instead of the flaring, wasting tallow candle on the kitchen-table, or in the windy cottage, one may see now the pretty tin lamp (only sometimes too gaily painted) suspended overhead, giving an abundant and equal light to all the room. With the ordinary care in cutting the wick there is no smell, there is no dirt, and it is the cheapest light yet known. Whether it will continue so when it has cleared off all the ranges of mountains of small coal round the mouths of our coal-pits, another generation will see. At present, its cheapness causes a saving of pounds in a year to many housekeepers, and affords to the humbler consumers a better light

than they have ever before enjoyed for less money. We shall never know what the reduction is in babies burnt; but of the fact of the reduction there can soon be no question.

I must resist the temptation of speculating on the effect on industry of the extinction of candles. It would be amusing to relate what has happened already, and to show what must be expected when there is no demand for dips, moulds, composition, or wax; or for candlesticks or snuffers, of any form or size; and when a brisk trade springs up in lamps, chains, and shades, from the humblest to the most elaborate and graceful. But that view will wait. Our candle-makers export such vast quantities of the commodity that the change at home will not show any great immediate influence on the tallow-trade or the northern fisheries. That part of the subject may wait. And I cannot but feel that my main topic is somewhat too grave for it.

However few may like to speak of it, we all really wish to know something of the endurableness of death by fire. There ought to be a good deal of evidence on this head, considering the number of lives so lost in all ages. There is, in fact, a good deal of evidence; but it is so various as to be found very perplexing. The only rational conclusion is that there are great varieties of suffering, in accordance with the differences in men's frame of body, and yet more, state of mind.

We must remember that nearly all who perish in conflagrations of dwellings die by suffocation, except the few who die as Mr. Braidwood did. Persons who have had severe burns from which they have recovered have said that all the bodily pain was afterwards: either the flame did not hurt, or the perturbation of mind rendered it unfelt. An acquaintance of mine, burnt in the hands in saving a child, and suffering tortures afterwards, even said that the sensation was for the instant rather pleasant than otherwise. But this has no bearing on what we want to know,—the endurableness of being burnt to death.

We need not, unhappily, go back to the old records of religious martyrdom for evidence. Men are burned alive now, year by year,—not only in Red Indian warfare, nor in missionary life among the heathens,—but in the United States, and wherever slavery exists.

In 1836 a negro was so burned in Missouri. The management of the deed was as cruel as the deed itself. Suffice it that, after the longest half-hour he had ever passed, one gentleman said to another, "His pain is over, he does not suffer now:" when a voice from the foot of the tree, and behind the fire, said "Yes, I do." This victim had been very quiet: and his steady utterance of prayers and hymns showed what we are glad to know. But there is more direct evidence.

There has never been any doubt about the exhilaration of spirit with which men and women could meet that death, and any other. It is so common in the history of martyrdom that we all expect to find it, in every new instance. Latimer's exultation about lighting a great candle in England animates without surprising us: and we can sympathise with Ridley's noble economy in the midst of his last walk, when, seeing, on his way to the stake, a poor man barefoot, he slipped off his own shoes, and gave them to the staring stranger, saying it was a pity a pair of shoes so wanted should be burned. All this we understand: but the declaration of several of the martyrs in the midst of the fire that they felt no pain has perplexed many. The dying men themselves supposed it a miracle. We know now that when the skin has been acted upon to a certain point, sensation is lost. There have been instances of this absence of pain in fatal cases within a few months.

The best thing we know, in this matter, is the beautiful anecdote of one of our Protestant martyrs (was it Fisher of Hadleigh?) and his imperilled friends. Those friends expected that their turn would be next; and in the brotherly spirit of the time and circumstances, they talked over the whole matter with him. They would be present, on a rising ground in front of the stake,—which was very cheering to him: and he engaged to make a sign, if he found the pain endurable,—which would be very cheering to them. He would raise his hands above his head, in a manner agreed upon. They went and looked on; and for long they saw nothing. They could not wonder;—it was too much to expect the sign. At last, the victim raised—not his hands, for they were gone, but his arms, above his head, and kept them there so long as to leave no doubt of his intent. For all generations since this has been a comfort. It may make no difference, in any case, about encountering the martyrdom; but it is a great and genuine solace to know that the faculties may work truly in such extremity.

It is an extremity which is now never endured but by somebody's fault: and it is doubtful whether the proportion of victims to ignorance and carelessness diminishes. Do we mean that there shall ever be an end to deaths by fire?

From the Mountain.

SLAPTON.

Our village of Slapton is well known throughout Devonshire. Pleasure-seekers troop hither for the day. Excursion-steamers make trips to us. Numerous, and sometimes royal, visitors enjoy the hospitalities of the Sands Hotel. The coast-railway from Dartmouth to Plymouth will make Slapton a fashionable watering-place. At present, we are somewhat difficult of access. Totnes is our nearest railway-station. The place, however, is so justly celebrated throughout the county which contains it, and so deserving of a more extended fame, that a short account of it may not be uninteresting to the general reader. He may have read Flavel's work, prefaced "from my study at Slapton." He may have heard of Admiral Hawkins' glory in his great house of Poole; yet, forgetful, it is ten to one that he will say, as my friends said when I settled here, "Where in the world is Slapton?"

The parish of Slapton is washed by the sea. On its left is Dartmouth Harbour. On its right is the Start. The village itself nestles some three-quarters of a mile inland, where no wind can touch

it, and the one great breaker of the deep bay calls to it with a chastened sound. As the Start is the first land of the homeward-bounder, all the commerce of London and Southampton passes below the Slapton Hills, and ever and anon looks in the Channel Fleet, shows its white teeth, and away! but it is not for its marine interest only, shared with many other places, that Slapton is celebrated. I do not pretend that the most delightful thing in life, as a sick woman once said, is to lie in bed and see the Start Light go around, around, around! The two celebrities of Slapton are the Ley, and the Tower.

The Ley is a stream-fed lake, barred by a gravel bank from the sea. It exceeds two miles in length; its width ranges to half-a-mile; its waters have no channel into the sea, but percolate through the gravel. The brine cannot percolate to them. On the sea-side is the great fishing-ground of England. In shore numerous fishing companies draw the seine. The fish are sold by auction. In lieu of a hammer the auctioner holds a handful of sand, when the last grain has run out, the then highest bidder is the purchaser. Out at sea are the numberless trawlers of Brixham. That delicious little fish, the launce (ammodytes), is almost peculiar to Slapton. So also is the scallop. Besides these we boast nearly every fish that swims, especially "the woodcock of the sea," the red mullet. On the rocks around Dartmouth, and on the Skerries below the Start, are towns of crab and lobster pots, which every week in the season disgorge into the London market many hundred basketsful of crustacea. In the winter these towns cease to be submarine, and bleach about the beach and the cottages, whilst their site is swept by the oyster-dredger.

The Ley rivals the sea in piscine glory. "Good fische in Slapton Pool," we read in an old chronicle; and the pool still sustains its reputation. Perch may be caught as fast as the hook is baited. Boat-loads upon boat-loads are used every season for manure. Roach are as plentiful as perch, though they do not wear the perch's armour against the relentless pike. Pike of twelve pounds' weight and upwards are frequently captured, and one old fish, called the king of the pike, supposed to weigh upwards of thirty pounds, is often seen but never caught. The best spot for pike-fishing is beside the long beds of bulrushes. There are acres of these bulrushes in the Ley. They are very valuable for thatching, and plasterers use them instead of laths.

An enterprising gentleman, now dead, purposed to establish a manufactory for converting them into pens. They certainly, under his process, rivalled the best quills. Whether, in these days of steel, the project would have answered financially, is another question. It may be supposed that the Ley is the breeding-place of many aquatic birds, and the resort of many more in hard weather. A contest between a wild duck and a pike is worth seeing. The pike catches the duck's leg in its serrated jaws. Then comes the old game of French and English. Pull pike—pull duck. Now the duck is submerged. Now grisly snout and fierce eye are drawn out of the water. This duel is generally terminated by the duck flying away minus a leg.

Every year Sir Lydston Newman, to whom the property belongs, celebrates what is called a Ley day. He occupies with his friends about seven boats, which pull down the Ley in line of battle. Their fire consequently covers the whole width of the Ley. The wild-fowl would, under ordinary circumstances, take to the sea and escape. On this occasion hundreds of shooters occupy the banks, and direct a constant fusillade against elopers. Crowds of frightened birds, ducks, teal, widgeon, coots, *et hoc genus omne*, fly up and down the Ley, and fall in hecatombs.

A lively account of this scene appeared a few weeks since in the "Field," and, some years ago, there was a capital picture in the "Illustrated London News." Those of our readers who can refer to this picture will see the amusing battle over the dead birds. Every bird that falls has been shot at by some dozen guns, and there are possibly some dozen claimants. Years ago this annual battue used to be attended by an old prize-fighter. He carried a gun, but no ammunition. When a bird neared him, he pointed his gun. Probably the bird fell before the discharges of his neighbours. "My bird," he used to cry; and where was the rash one who would pick up that gage of battle?

The other celebrity of Slapton is the Tower. It is ninety feet high, and still in fine preservation. It is the only part remaining of a famous chantry, built by Sir Guy de Brien, one of the first Knights of the Garter. Sir Guy de Brien was standard-bearer to King Edward the Third at the Battle of Calais, 1349, and was rewarded for his intrepidity by a yearly pension of 200 marks from the Exchequer. Sir Guy de Brien does not lie here. He married the widow of Hugh de le Spenser, and was buried with her in Tewkesbury Abbey. His splendid tomb is described in pages 151 and 152 of "Sepulchral Monuments," and engraved in plate liii. of that work. They sang for the knight's soul at Slapton till the year 1545, when the chantry was surrendered to King Henry the Eighth, and granted to Thomas Arundell. Where once mass was said and music resounded, is a garden, and on a simple board these lines:—

> The knight's bones are dust,
> And his good sword rust,
> His soul is with the saints we trust.

J. S. V.

MY BURGLARY.

A REAL EXPERIENCE.

In the year 18—, I lived in a detached house in what is called the Regent's Park, about two miles from Southampton. One morning in the month of June, the servant came into my bedroom earlier than usual, in a great state of excitement, saying:

"Oh, sir, they have been trying to break into the house."

It was then only about seven. I jumped up, bundling on my clothes as quick as I could, and set about inquiring all particulars, when it appeared that this attempt had been made about four in the morning, that the cook had heard a crashing noise, and had called out to the stable boy, who slept over the stable, close adjoining the house, who had also heard the noise, and that they

then and there compared notes as to the time, and then (most probably being too frightened to move) went to bed again. I, finding nothing had been stolen, took matters more quietly, eat my breakfast, lit my cigar, and walked about, thinking what steps I had best take. Having gathered some little knowledge, through curiosity, at different times, from London detectives, &c., as to the different modes in which *a crib was cracked* (Anglicè, a house broken into), I examined the breach, that being a broken pane of glass, near the bolt of the window latch, where the attempt at entry had been made. I found that the putty, which had become very hard, had been attempted to be cut away, with the view, evidently, of taking out the pane of glass, and that in attempting this the window had been broken, and then the latch of the window undone, and the shutter (which the thief thought no doubt turned on a hinge, but was a moveable one) had, on being pushed, fallen down on the stone floor, which was, of course, the crashing noise heard by the cook and the boy.

I knew from this inspection that the man was not an *artist*, and but a "muff" at his work. This was something (though not much certainly) to go upon. While examining the putty, I fancied I saw something shining. I then examined it more closely with a pocket microscope which I always carry about with me, and I then saw the jagged portion of the blade of a pen-knife, and on further search, found another piece of a blade, and on placing the two bits together on a sheet of writing paper, found they were portions of the same blade. To find the remainder of the knife—*that was the thing!* As then the case would begin to assume a criminating shape, diligent search was made, but with no effect.

Now there was attached to the house a kitchen garden, and a small flower garden, which were once a fortnight put in order by a working gardener, who lived close to Southampton. His job generally took two days, but always more than one; and on this occasion the garden was undergoing its usual trimming; the morning of the second day being the morning of the attempted burglary. I perceived that the gardener had not returned to complete his work. I did not think very much of this circumstance, as once or twice before he had given me the trouble of sending after him; he having left my job half-finished in order that he might work at some other one elsewhere. I then told the stable lad to go after the man, and to tell him if ever he served me this trick again I would employ him no more. On which the boy said, "Oh, sir, he has been here this morning, and he said he was coming back again in the afternoon to do half a day's work."

On hearing this I was just turning away, when the lad added: "He came here in a pair of *slippers*, and on my saying to him, 'Them's *rum things* to come a gardening in,' he said: 'Yes, they be; but I have been up nearly all night playing at cards with some pals, and my feet swelled so I could not bear my boots on.'"

Now all this was very possible, and, perhaps, not improbable, and, under other circumstances, I might have thought nothing about it, but my mind being naturally full of the burglary I caught at the word "slippers"—connecting these articles in my mind as part of a "cracksman's" dress—and like lightning, and as if by inspiration, though with no data on which to ground it, the strongest conviction seized hold of my mind, *John, the gardener, is the man.* So strong was this that I could not be quiet; I could see him, as I fancied, cutting away the putty, &c., &c. I returned to the boy, and asked him a variety of questions, and particularly as to what else John, the gardener, had said, and as to his manner, &c., without eliciting anything of importance. At last I said, "Did he tell you *where* he had been playing at cards?"

"Yes," said the lad. "At the Pig and Tinder-box, in —— Street."

So, thought I, as I am going into Southampton, to see Inspector P——, I will just look in at the Pig and Tinder-Box, and have a talk with the landlord. So I told the boy to get the horse harnessed as quickly as possible, and into Southampton I drove, putting up in the next street to the Pig and Tinderbox, so as not to excite any suspicion by driving up to the door; and, walking into that establishment, ordered a glass of beer, and asked for the master of the house.

"Do you know a man of the name of John, a gardener?" said I.

"No," said he; "I can't exactly say as I does by name, but I daresay I should know him if I were to see him; we has so many, you know, of all sorts coming to this house, but I should not wonder if my man knows him."

So the man was called, and I asked him:

"Were you serving the customers last night?"

He said "Yes."

"Do you know John Holder, a gardener?"

"Yes," said he; "I *knows* him."

"Does he often come here?"

"Not very often," said he.

"Was he here yesterday?"

"*No.*"

"Was he here last night, either before or after twelve?"

"*No.*"

"*Are you perfectly certain of this?*"

"Yes."

And I said:

"If you were called upon, would you *swear this?*"

"Yes."

"And he could not have been in any other part of the house without your being aware of it?"

"*No.*"

Now, thought I to myself, "Gardener, the scent is getting uncommonly warm. I'm running you down a little faster than you think for." For I now had *no doubt* he was the man. How stood the case? House broken into, John comes in the morning in slippers, tells a lie unasked for, and, when he hears I am getting up, is evidently afraid to meet me, and bolts away, saying he will return in the afternoon.

My next visit was to Inspector P——, who, after giving instructions to another policeman to come in half-an-hour's time to my house with his dog-cart, accompanied me back again to my house, having previously gone with me to the Pig and

Tinderbox, to have repeated to him by the barman that which he had said to me.

On our arrival we found John at work, mowing the lawn. I *apparently* took little or no notice of him, but whenever I could do so furtively had a good look at his countenance, and *whenever I looked*, as P—— and myself were walking about the garden (he, P——, being in plain clothes), his eye was on us, and I observed he was, in consequence of this, notching the grass. P—— and I had a long conversation; he hesitated very much about taking the man, he said; he was inclined to agree with me that it was very likely he was the man, but he said we have not enough, at present, to go upon. So, after a little further delay, he went up to the gardener, and said, very suddenly, "Have you heard Mr. S——'s house was broken open last night?"

"God bless me!—no," says the man. "What a terrible thing, to be sure."

Lie number two, for John, the lad, had told him in the morning. No notice was taken of this lie by either of us, but a sort of smile now played upon the inspector's countenance, and he proceeded to ask him:—

"Have you seen any suspicious-looking character about here lately?"

"No," said the man, "nobody."

"No tramping fellows, or anybody of that sort?"

"No," he had noticed no one of the kind.

All this time the inspector kept getting a little closer to him, and in a light playful tone, said, while just tapping the outside of his waistcoat-pocket, "Lord! how your pockets stick out! Do you carry your tools in your pockets? Let's see what you've got in them," and suiting the action to the word, coolly put his hand in the man's pocket, upon which he first of all turned deadly pale, and then began to ride the high horse, from which he had, as is about to be told, a mighty tumble.

Pocket number one brought forth some pawn-tickets, and some lucifer-matches, and other articles of trifling import. Pocket number two brought forth various things, and among them a buck-horn handled knife with two blades, *one of which was broken*. On seeing this I could hardly contain myself, and was about to say something, when Inspector P—— gave me a look, as much as to say, "*Mum for the present*," that functionary at the same time saying to John in the blandest and most insinuating manner, "Now, just let you and I have five minutes' conversation inside the house, and then you can go on with your work."

So into the house they walked: I was then walking behind them. Presently I observed P—— (without turning his head in the least on one side), impatiently shaking something in his hand, which he held behind his back, as if for me to take it, so I walked up to the side of him, and unobserved by John, he slipped into my hand *the knife with the broken blade*.

I knew then what I had to do, and showing the inspector and his new acquaintance into a room, went into another room, got a sheet of note paper, placed on it the two broken bits of blade before alluded to, and then opening the broken blade of the knife, put it to the broken bits, and the three made a complete knife, and a complete case. For on my return to my friends in the other room, I merely said, "*It's all right, P——, it's a case.*"

P—— thereupon quietly took from his pocket a most elegant pair of bracelets, very bright, and made of iron, but with this peculiarity about them, that they were joined together by about three inches of strong chain; and with these ornaments he adorned the wrists of our now common acquaintance the gardener, John. By this time the policeman had arrived with the dog-cart, in which John, the gardener, was asked to go for an airing.

Now, at 4 A.M., John, the gardener, was cutting away the putty from my window; at 2 P.M. he was seated, decorated as I have described, in the smartest of dog-carts, between Inspector P—— and Policeman X, of the Hants Constabulary, on his road to W—— gaol.

The case came on before the late Baron A——. He was indicted for burglary, but was directed by the judge to be acquitted, as to constitute a burglary it must be proved that a portion of the person must enter the premises, and this entry the evidence did not sufficiently prove. But, by the direction of the judge, he was detained and re-indicted for misdemeanour, all the evidence being gone over again; the jury did not take five minutes to pronounce a verdict of Guilty, and he was sentenced to eighteen months' hard labour.

A hint to gentle burglars in general.—If he had flung away the knife with the broken blade, he might have got off. The correspondence of two minute pieces of steel convicted him. S. W.

THE FATHER OF THE REGIMENT.

(AN OLD GRENADIER'S STORY OF AN EPISODE IN THE RETREAT OF NAPOLEON'S "GRANDE ARMÉE" FROM MOSCOW.)

THICK snow-wreaths weighed upon the firs,
Snow shrouded all the plain,
Snow brooded in the dusky clouds,
Snow matted the chill rain,
Snow filled the valleys to the brim,
Snow whitened all the air;
The snow-drifts on the Dnieper road
Blinded us with their glare.

The white snow on our eagles weighed,
It capped each crimson plume;
Knee-deep it now began to rise,
Striking us all with gloom.
It clotted on our waggon wheels,
And on our knapsacks weighed,
It clung to every soldier's breast,
And every bayonet blade.

It quenched the shells and dulled the shot,
That round us faster fell,
As all our bayonets glancing moved
Down the long Russian dell
That to the Dnieper river bore.
Ney battled in our rear;
Griloff was nearly on us then,
The Cossacks gathered near.

The Russian lancers charged our guards,
Our grenadiers, and horse;
The Russian serfs, with axe and knife,
Were gathering in force,

As floods of us with carts and guns
Bore down upon the ridge
That led, by snowy swathes and slopes,
Unto the Dnieper bridge.

The sun, a dull broad spot of blood,
Smouldered through icy clouds ;
The snow, in blinding heavy flakes,
Was weaving soldiers' shrouds.
Here lay a powder-waggon split,
Its wheels all black and torn,
And there a gun half buried in
The ruts its weight had worn.

Drums splashed with blood and broken swords
Were scattered everywhere ;
Our shattered muskets, shakos pierced,
Lay partly buried there.
Guns foundered, chests of cartridge burst,
Lay by the dead defaced ;
By hasty graves of hillocked snow,
You could our path have traced.

Still one battalion firm was left
(Made up of Davoust's men)
"The *Vieille Roche*" we called the band,
In admiration then.

The "Father of the Regiment,"
De Maubourg, led us on,
With the old Roman's iron will,
Though hope had almost gone.

Two sons he had, who guarded him
From every Cossack spear ;
One was a grenadier, whose heart
Had never known a fear ;
The other boy a lusty drum
Beat by his father's side ;
I often saw the father smile
To see the stripling's pride.

There came a rush of ponderous guns,
Grinding the red churned snow,
Making their way o'er dying men
Unto the bridge below.
Ney gathered close his prickly squares
To keep the Russians back,
For fast those yelling Cossacks came
Upon our bleeding track.

Maubourg was there erect and firm ;
I saw him through the fire ;
He stooped to kiss a dying friend,
Then seemed to rise the higher.

Great gaps the Russian cannon tore
Through our retreating ranks,
As slowly, grimly, Ney drew back
Unto the river banks.

Shot in the knee I saw Maubourg,
Borne by his sons—slow—slow;
They staggered o'er the muddy ruts,
And through the clogging snow.
"Fly, leave me, children! Dear to France
Young lives are," then he said.
They both refused—a round shot came,
And struck the eldest—dead.

The boy knelt weeping by his side,
Trying in vain to lift
The old man's body, which but sank
The deeper in the drift.
"Leave me, my child!" he cried again.
"Think of your mother—go.
We meet in Heaven. I will stay,
Death is no more my foe."

The boy fell weeping on his breast,
And there had gladly died,
But I released his clutching hands,
And tore him from his side.
One kiss—no more—and then he went,
Beating his drum for us;
I did not dare to turn and see
The old man perish thus.

Again there came a rush of spears,
But we drove on the guns.
We—bronze and iron with the heat
Of the Egyptian suns.
The eagles led—our bayonets pressed
Over the Dnieper bridge;
Ney was the last to turn and pass
Down the long gory ridge.

The boy became a marshal, sirs;
I saw him yesterday
Talking to Soult, who loves right well
To chat of siege and fray.
He often finds our barracks out
And comes to see us all,
We who escaped from Moscow's fire,
From Russian sword and ball.

Walter Thornbury.

"CATO" ON THE BOARDS.

Was Mr. Addison laying to heart Horatian counsel when he retained his tragedy in his writing-desk for nine years? Not that he denied it an airing now and then. It was in 1703 that Captain Richard Steele, at a tavern, read privately to Mr. Cibber, afterwards manager of Drury Lane theatre, a manuscript, unfinished, being four acts of a play upon the death of Cato, which Mr. Addison had planned and commenced during his travels. Of course there was a bottle upon the table, and of course the Captain sipped his wine pretty freely during the pauses of the play, resting his voice, which had been rolling and swelling and storming enough in the sounding speeches and pompous music of his friend's work, and commenting upon its glories and merits and marvels. Perhaps now and then Mr. Cibber took up the wondrous tale, and rendered a scene or two with more elegant elocution, and with more of a player's propriety of action, if without the excessive passion and exuberant enthusiasm of his comrade the author's friend. Doubtless the drawer was rather astonished at the stir the two gentlemen in the private room were making, if indeed he was not accustomed to boisterous eccentricity on the part of the captain, who was always noisy over his bottle or his glass of strong waters, laughing, crying, speech-making, clamorous and troublesome, and rather a bore it may be, with his ceaseless trumpeting of Joe Addison and his doings and his genius. However, about that time he had cause to be loud in his friend's praise. Many applauded strokes in his second comedy, "The Tender Husband," as Sir Richard afterwards confessed, had been supplied by Addison's kindly hand. The play had been acted with great success, and is indeed full of humorous writing. In his next essay Sir Richard, running alone, was very sober and dull, perhaps a little too moral for his audience, and the "Lying Lover" was damned straightway.

Captain Steele was delighted at the warm approval the incomplete "Cato" received at the hands of Mr. Colley. Perhaps they both then grew rather melancholy over their cups, as the merriest topers will sometimes grow. The player was greatly disappointed to learn from Captain Steele that "whatever spirit Mr. Addison had shown in his writing it, he doubted he would never have courage enough to let his 'Cato' stand the censure of an English audience: that it had only been the amusement of his leisure hours in Italy, and was never intended for the stage." Men who write plays persist that they never intended them to be played, just as men who write poems will have it that they never purposed to print until "obliged by hunger and request of friends." Sir Richard spoke with much concern of his friend's unfortunate diffidence, and in the transport of his imagination could not help saying, "Good God! what a part would Betterton make of Cato!" But on the 28th of April, 1710, poor Mr. Betterton died: and he had been three years in his grave in Westminster Abbey when Cato came upon the stage.

It could have been no secret, however, that Mr. Addison had written a play. Captain Steele knew of it, and talked about it frankly and noisily after his wont. Pope, too, had seen and read it. Still the author shrank from completing his work; would have it that it was unfit for, and that he had never contemplated its production on, the stage. He was always shy and bashful, keenly sensitive like all men with delicately acute powers of observation—he held back with a child's timidity from the idea of failure—and perhaps the coarse, stormy applause of a theatrical success seemed almost as repellent to him as the dreadful violence of failure. The rude cheers and vulgar clapping of hands had little attraction for him; but how much more terrible the hisses and catcalls and groans! He wore his nerves very much on the surface, and he started at thoughts: his quick fancy gave such vivid vitality even to his dreams. "Still," as Dr. Johnson writes, "the time was now come when those who affected to think liberty in danger, affected likewise to think that a stage-play might preserve it: and Addison was importuned in the names of the tutelary deities of

Britain to show his courage and his zeal by finishing his design." Yet he deliberated and vacillated, and at last announcing his inability to complete the play, applied to his friend Mr. John Hughes to write a fifth act for him. Hughes had published poems on the "Peace of Ryswick" and the "Court of Neptune," on the return of King William, and a Pindaric ode on the death of the king, called the "House of Nassau." How little Hughes must have known Addison! He thought his request quite serious, and in a few days had written several supplementary scenes, and submitted them for the play-writer's examination. Meanwhile, of course, Addison had gone to work and produced half an act. So there was an end to Mr. Hughes's labours. In due course Mr. Addison finished his play, "but," says his biographer, "with brevity irregularly disproportionate to the foregoing parts, like a task performed with reluctance and hurried to its conclusion." Many of his literary friends, Pope amongst them, still counselled him to be content with printing the play, and not run the risk of a stage representation; it was hinted to him that the audience might grow tired even of the very best rhetoric; that he had written a poem, not a play; a book for students, not groundlings, and so on; while his political associates were urging the importance of his work as a party manifesto. The audience, he was assured, would recognise a Tory in Cæsar, an apostate Whig in Sempronius, and an analogy between Cato struggling to the death for Roman liberties and the patriotic Whigs rallying round Halifax and Wharton. Addison yielded to the wishes of his party with an apparent reluctance. He was charged, however, with having only affected coyness, while his mind was thoroughly made up to give his play to the actors. It is noteworthy that the most savage attack upon him came from his own side. Dennis, a zealous Whig, in his "Remarks on Cato," written with a cleverness only equalled by its coarseness, charged him with "raising prejudices in his own favour by false positions of preparatory criticism, and with poisoning the town by contradicting in the 'Spectator' the established rule of poetical justice, because his own hero, with all his virtues, was to fall before a tyrant."

"Cato" came upon the boards in April; a time of the year when it had been usual to devote three nights a week for the benefit plays of particular actors. However, it was decided that the benefits should be postponed to make way for Mr. Addison's great tragedy. Wilks, Dogget, and Cibber were the managers. Addison read his play to the actors in the green-room. Perhaps his bashfulness marred his eloquence. On the occasion of the second reading he begged Mr. Cibber to take his place, and was so delighted with his intelligent elocution, that he requested him to undertake the part of Cato. Probably Addison was carried away by the excitement of the scene, or he would have been less pressing that a comic actor should represent the chief character in a tragedy. Cibber was vain enough, but he was shrewd also. He knew his own forte. He did not care to risk his comedy laurels, the triumphs of Lord Foppington, Fondlewife, and Sir Novelty Fashion, for any philosophic glories to be gained in the toga of Cato. He preferred the part of Syphax; Wilks chose that of Juba. There must have been a sort of notion that Cato was what actors call an "uphill" part. They both agreed that Booth was the best representative of Cato that could be secured, while yet there was a fear that Booth, being quite a young man, might decline to appear in so solemn and severe, and—to use the professional term—"heavy" a character. So Wilks took the part to Booth's lodgings, pressed upon him its importance, and persuaded him to accept it. Booth waived all discussion as to the importance of the character, and admitted his willingness to play it, if the managers so desired, reserving entirely his own opinion in regard to it. "This condescending behaviour," we are told, "together with his performance of the part so much to the delight and admiration of the audience, gave both Wilks and Cibber the greatest pleasure."

All hands at the theatre were busied in the production of Mr. Addison's play. "As the author had made us a present of whatever profits he might have claimed from it, we thought ourselves obliged to spare no cost in the proper decoration of it." This must be understood with limitations. *Mise en scène* was in an early state of existence. The scenery, dresses, and decorations were rather more splendid than appropriate. There were strange conventions then insisted on in regard to stage costume. Addison, writing in the "Spectator," gives us frequent glimpses of the dresses and decorations of the drama of his day. "The ordinary method of making an hero is to clap a huge plume of feathers upon his head, which rises so very high that there is often a greater length from his chin to the top of his head than to the sole of his feet. This very much embarrasses the actor, who is forced to hold his neck extremely stiff and steady all the while he speaks, and notwithstanding any anxieties which he pretends for his mistress, his country, or his friends, one may see by his action that his greatest care and concern is to keep the plume of feathers from falling off his head." Whether Mr. Booth, as Cato, wore a plume is not ascertained, but it is highly probable that he did. Certainly he wore a full-bottomed wig, value fifty guineas; certainly Marcia appeared in a hoop and brocaded satin, and others of the performers were loudly applauded for their magnificent gold-laced waistcoats. Mrs. Betty Lizard, in the "Guardian," we find, "overlooked the whole drama, but acknowledged the dresses of Syphax and Juba were very prettily imagined." Her sister, Mary Lizard, writes, "My brother Tom waited upon us all last night to Cato; we sat in the first seats of the box of the eighteen-penny gallery. You must come hither this morning, for we shall be full of debates about the characters. I was for Marcia last night, but find that partiality was owing to the awe I was under in her father's presence; but this morning Lucia is my woman," &c.

Every care was taken to secure a success. As in the case of Ambrose Philips's "Distressed Mother" (Racine's "Andromaque"), the house was filled with the author's friends, determined upon the

triumph of "Cato," so far as lusty applause could bring about that result. Captain Steele undertook the packing of the house, and accomplished his task thoroughly. Fancy the gallant officer, his hat cocked jauntily, clothed in his best scarlet coat, rather soiled about the gold-lace edgings, assembling a select party at the Devil, or the Gray's Inn, or the Fountain, or the Tennis Court Tavern or Coffee-house. Bumpers round to the success of Joe's tragedy! He never wanted an excuse for a glass, but this was really a prime one, and then a rather unsteady march of the chosen band to the theatre.

Addison was very nervous about the whole business. Suppose that political zeal should carry the house too far? It was a time of extraordinary excitement. Mr. Pope's line in the prologue, "Britons, *arise*, be worth like this approved!" might stir up the audience to some treasonable act. The author of the play might be charged with promoting insurrection. "The line was liquidated," says Johnson, "to *Britons, attend!*" The opposition peers crowded the boxes. The pit was full of zealous partisans, frequenters of the Whig coffee-houses, and students from the Inns of Court. To make assurance doubly sure, Sir Gilbert Heathcote, Governor of the Bank of England, "Sir Gibby," as he was popularly called, came from the city, bringing with him a host of fellow citizens, "warm men and true Whigs, but better known at Jonathan's and Garraway's than in the haunts of wits and critics," as Lord Macaulay says. These were instructed to cheer to the utmost whenever a Tory hiss was heard. But, in truth, these tremendous preparations for defence were entirely unnecessary.

The Tories had never contemplated the slightest opposition to the play. The gentle, courtly, and kind-hearted Addison was the last man whose opinions they would have dreamt of attacking through his literature, much less whom they would have planned to crush by an acrimonious antagonism. The severest Tory-writers paid homage to him as a scholar and a gentleman of wit and virtue, in whose friendship many of both parties were happy, and whose name they heard, with regret, banded about in the brawls of factions. Certainly the conduct of Captain Steele and his civic auxiliaries was irritating enough to provoke opposition. But the ministerialists only laughed good-naturedly when Sir Gibby and his friends made the mistake of applauding the sham patriotism of the hypocritical Sempronius with greater enthusiasm than they could be induced to bestow on the calmer eloquence of Cato. Pope, in his letter to Sir William Trumbull, gives a vivid description of the first night. "Cato was not so much the wonder of Rome in his days, as he is of Britain in ours: and though all the foolish industry possible has been used to make it thought a party-play, yet what the author once said of another may the most properly in the world be applied to him, on this occasion:

> "'Envy itself is dumb in wonder lost,
> And factions strive who shall applaud him most!'

The numerous and violent claps of the Whig party on the one side of the theatre were echoed back by the Tories on the other; while the author sweated behind the scenes with concern to find their applause proceeding more from the hand than the head. This was the case, too, of the prologue-writer" (Pope, himself), "who was clapped into a staunch Whig at almost every two lines." Imagine Addison ("he had light-blue eyes, extraordinary bright, and face perfectly regular and handsome, like a tinted statue," says Colonel Henry Esmond), imagine Addison standing in the wings, or, as Mrs. Porter related, wandering through the whole exhibition behind the scenes with restless and unappeasable solicitude, shrinking rather as Booth rolled out his lines at the footlights, and the audience shouted plaudits not to the poet but to the politician—approved not the polish and music, and even beauty of his verses, but the inuendoes of party supposed to lurk in them. Was he satisfied, do you think? Was his muse not rather ashamed and affronted? Still the loud roar of applause, Captain Steele playing the part of fugleman, must have had a pleasant ring in it. And it would have been hard at that moment to pause and analyse it, to see how far it was adulterated with the spirit of faction.

The sons of Cato enter, and the play begins:

> "The dawn is overcast: the morning lours,
> And heavily in clouds brings on the day,
> The great, the important day, big with the fate
> Of Cato and of Rome," &c.

Some of the critics (they must have been of the Tory camp) thought they discovered here a plagiarism from Nat Lee's "Alexander":

> "The morning rises black: the louring sun,
> As if the dreadful business he foreknew
> Drives heavily his sable chariot on," &c.

The actors were very perfect; indeed there had been most careful drilling and rehearsing. To many of them the author or his friend the captain had been at pains to give personal direction and instruction how they should enact their parts. Lacy Ryan, a young man of eighteen who acquired a considerable fame by his performance of Marcus, one of the sons of Cato, had been expressly selected for the part by Addison, who, with Steele, invited the player to a tavern to explain to him the character and instruct him in its rendering. He was famous afterwards for his representations of the lovers of tragedy and the fine gentlemen of comedy, though a wound he received in the mouth from the pistol of a footpad was said to have occasioned an unpleasant alteration of his voice. Cibber as Syphax endeavoured to follow the style of Kynaston, who had imported into tragedy an ease and freedom approaching the colloquial. The sticklers for the dignity of the tragic music had always deprecated this innovation, and Addison, at the rehearsals, had expressed a fear that the audience might take too familiar a notice of the sentiments of Syphax delivered by Mr. Cibber. After the performance, however, the author came round to the actor's opinion, and admitted that "even tragedy, on particular occasions, might admit of a laugh of approbation." The fact was the tragedians, accounting themselves as of the highest caste of players, had been always angry

and jealous at the progress of comedians. Powell had once been in a great rage because he had been obliged to appear as Cæsar Borgia, in a much less splendid coat than Cibber wore as Lord Foppington.

Wilks was greatly admired as Juba. He played with much animation and feeling; was very graceful in his attitudes and actions. Comparing him with Booth, Cibber says: "In sorrow, tenderness, or resignation, Wilks plainly had the advantage, and seemed more pathetically to look, feel, and express his calamity." He was noted for his perfectness in his parts: it was said "that in forty years he never five times changed or misplaced an article in one of them." Mrs. Porter appeared as Lucia. Speaking of a later period of her career, Horace Walpole declared that, in passionate tragedy, she surpassed even Garrick. She was entrusted with the epilogue—a frivolous composition by Dr. Garth, and quite unworthy of the occasion.

But, of course, the real hero of the performance was Barton Booth. A Westminster schoolboy, under Dr. Busby, he earned his first laurels by his acting in a Latin play at the school. About to proceed to the University, he absconded and joined the company of Mr. Ashbury, the manager of the Dublin theatre. Ashbury was a good actor—was famed for his Iago. Wilks, Booth, and others gained greatly by his instructions. He had even taught Queen Anne, when she was only princess, the part of Semandra in Lee's play of "Mithridates, King of Pontus," performed at the banqueting-house, Whitehall, by persons of rank. For his services on this occasion he obtained the appointment of Master of the Revels in Ireland. Mr. Booth played for three seasons in Dublin with extraordinary success. He then came to England strongly recommended to Mr. Betterton. As a young man he had unfortunately fallen into habits of excess rather fashionable in his day, but warned by the example of George Powell, an actor who had ruined himself by his intemperance, "Booth" (says Cibber) "fixed a resolution which from that time to the end of his days he strictly observed, of utterly reforming: an uncommon act of philosophy in a young man of which in his fame and fortune he afterwards enjoyed the reward and benefit!" He had founded his style upon Betterton as Wilks had founded his upon Mountford and Cibber *his* upon Kynaston. Acting is full of traditions. Victor, in his "History of the Theatre," thus describes Booth: "He was of a middle stature—five feet eight, his form rather inclining to the athletic though nothing clumsy or heavy: his air and deportment naturally graceful, with a marking eye, and a manly sweetness in his countenance. His voice was completely harmonious, from the softness of the flute to the extent of the trumpet. His attitudes were all picturesque: he was noble in his designs and happy in his execution." Aaron Hill pays the actor a high compliment when he says: "The *blind* might have seen him in his *voice*, and the *deaf* have heard him in his *visage*." The elocution of Mr. Booth's day was very much of the *ore rotundo* order. Blank verse was delivered with a solemn and stately articulateness. However, the actor indulged occasionally in a whirlwind of passion. In Lear, we are told, "his fire was ardent and his feelings remarkably energetic: in uttering the imprecations in general he was more rapid than Garrick." His principal parts besides Cato were Pyrrhus, Othello, Brutus, Lear, Marc Antony, Aurungzebe, Jaffier, the Ghost in Hamlet, &c. Macklin described the actor's Pyrrhus "as awfully impressive," so much so that he stood fixed with amazement at it. When he played Brutus, and delivered the sad words, "*Portia is dead!*" the whole audience are said to have wept with him. He was essentially a tragic actor. Once at the command of the Queen, and following the example of Betterton, he played Falstaff, but as he never repeated the part, it is probable the experiment was unsuccessful. Those who have smiled at the notion of the player appearing as Cato in a full bottomed wig, may be interested in knowing that he was considered for his time a very careful dresser. He was the first to wear a plume of feathers in the helmet of the Ghost in Hamlet, and to cover his feet with felt so as to make no noise in passing over the stage. Booth was born in 1681 in the county Palatine of Lancaster. His health failing him he retired from the stage in 1729. He died in 1733. He was twice married—first, in 1704, to the daughter of Sir William Barkham, a Norfolk baronet, and, secondly, to Miss Santlowe, an actress who had made a great reputation in the character of the Fair Quaker of Deal. Scandal whispered that she had acquired a large fortune by accompanying John Duke of Marlborough to Flanders in the campaign of 1706. She survived her husband forty years. Booth was said to have been concerned in the building of Barton and Cowley Streets, Westminster; to the former of which he gave his own Christian name, and to the latter the name of his favourite poet.

The political triumph which the Whigs were enjoying in the success of "Cato" was ingeniously countermined by Bolingbroke, who sent for Booth between the acts, and before the whole theatre presented him with a purse of fifty guineas for so well defending the cause of liberty against a perpetual dictator, and dying so bravely in the cause of liberty. This was an adroit reference to Marlborough's attempt, not long before his fall, to obtain a patent creating him Captain-General for life. Dogget, the manager, a sturdy Whig, regarding this as leaving the victory in the hands of the Tories, proposed that a similar present should be made to Booth by the Whigs, "as he could not bear that so redoubted a champion for liberty as Cato should be bought off to the cause of a contrary party." Booth was nothing loth to receive tribute of this kind from both sides of the house. Indeed, his reputation was so greatly enhanced by the honours paid to him, that he laid claim to a share in the management of the theatre, and in the license for the following season his name was added to the names of the existing managers. This so mortified Dogget, that he at once threw up his share in the property of the theatre, and was said to have thus abandoned an income of 1000*l.* per annum. However, he had already acquired a fortune by his frugality and success,

and could therefore afford to indulge his spleen thus liberally.

"Cato" was played every day for a month (Mondays excepted) to constantly crowded houses. It came at the close of the season, a sort of splendid aftercrop, bringing a gain to the management almost equal to two fruitful seasons in one year. In the summer, the Drury Lane actors played "Cato" at Oxford with remarkable success. The gownsmen demanded admittance in crowds at twelve o'clock at noon, and hundreds went away unable to obtain room. The Vice-chancellor publicly thanked the players "for the decency and order observed by our whole society," says Cibber; adding, significantly, "an honour which had not been always paid upon the same occasions." The actors received double salaries, and the managers were still enabled to pay fifty pounds as a contribution towards the repair of St. Mary's church. Indeed the London and Oxford profits together brought to each manager the handsome sum of fifteen hundred pounds.

The most important of Booth's successors in the *rôle* of "Cato" were Quin, Sheridan, and, lastly, Kemble. On the occasion of Quin's first appearance in the character, he modestly announced in the bills that Cato would be *attempted* by Mr. Quin. Nevertheless, he so roused the audience by his powerful acting in the scene where Cato extols his dead son, brought in upon a bier, with the words, "Thanks to the gods, my boy has done his duty!" that the house rang with acclamations of "Booth outdone!" while the famous soliloquy, "It must be so—Plato, thou reasonest well!" was vehemently encored! Still he must have been rather pompous and blatant in his style, he was so bent on giving intense sonority to his elocution. He pronounced the letter *a* broad and open. Garrick sounded it more like an *e*. When Quin, as Coriolanus, ordered the centurions to lower their *fasces* as a tribute of respect to Volumnia, the actors thought he said their *faces*, and commenced to bow their heads, greatly to the amusement of the house. A Welsh actor, named Williams, playing a messenger, and delivering the line, "Cæsar sends health to Cato," pronounced it "*Keeto*," greatly to the wrath of Quin, who burst out with "Would he had sent a better messenger!" This led, unhappily, to serious consequences. Williams, deeply incensed, vowed vengeance, and attacked Quin under the Piazza, on his return from the tavern to his lodgings. Quin drew, and they fought desperately, Williams receiving a mortal wound. Quin was tried at the Old Bailey, and a verdict of Manslaughter was returned. Mr. Sheridan is said to have played the part "with fine classical taste; excelling in the level declamatory portions." John Kemble was perhaps the first to represent "Cato" correctly as to costume, though it was some time before he deemed it necessary to be particular in that respect. His first appearance in London was as Hamlet, when he wore a black velvet court suit, with a star and riband, and long hair, powdered but dishevelled.

With Mr. Kemble playing "Cato" to the Portius of Mr. Young, the pronunciation difficulty was revived. The former would call Rome, *Room;* the latter adhered to the more ordinary pronunciation of the word. Neither would give way, and the pit laughed at and applauded each actor by turns as he came to the contested word and rendered it in his own fashion. Kemble's manner of pronouncing, indeed, was at all times eccentric. He called "innocent," *innocint;* "conscience," *conshince;* "virtue," *varchue;* "fierce," *furse;* "beard," *bird;* "thy," *the;* and "odious," "hideous," and "perfidious," became *ojus*, *hijjus*, and *perfijjus*. But Kemble was the last "Cato,"—"The last of the Romans!"

Time is a great iconoclast—reverses all sort of verdicts. What has become of "Cato"? as a poem? as a play? In his day it did much to raise Addison's fame: it does little to support it now. Johnson calls it the noblest production of Addison's genius. Macaulay places it long after the masterpieces of the Attic stage, after the Elizabethan dramatists, after Schiller, Alfieri, Voltaire, Corneille, Racine. In truth, Addison, in spite of his refinedly sensitive organisation and his great knowledge and appreciation of human nature, produced a play without feeling and without nature—a literary bas-relief, carven out of cold and colourless stone—its only recommendations, that it was right according to rule, and fashioned accurately after classical patterns. It gave London a month's excitement, and has since supplied the world with some trite quotations—that is all. It is melancholy to think that Mr. John Dennis's coarse criticisms were probably just. Addison made no reply to them. As Pope said, he was best avenged, as the sun was in the fable upon the bats and owls, by *shining on*. Perhaps Addison would have been thankful if Pope had been equally reticent. He published an unwise reply, called "The Frenzy of John Dennis." Addison publicly disclaimed all share in it, and Pope, bitterly hurt, was his friend no more.

DUTTON COOK.

THE ORIGIN OF THE LAKE OF GIDDEN.

IN the island of Rugen, in the Baltic, may be seen the Lake Gidden, the origin of which, according to a popular tradition, was as follows.

There once lived in the island two women, one of whom was charitable and compassionate, and the other hard-hearted and avaricious. One evening, in the midst of a tempest of wind and rain, a poor old man, dressed as a beggar, presented himself at the cottage of the ill-disposed woman, and begged for a bit of bread and a night's lodging. This woman was rich, but for all that she refused to relieve him, and roughly drove him away. The old man next went to the other woman who was poor. She received him with kindness, and shared with him her last morsel of bread. He passed the night under her roof, and in the morning, on thanking her for her goodness, he said:

"In return for your hospitality, you will, for a whole day, have in abundance whatever you may first take in hand."

The woman smiled, taking the speech for a good-natured jest, expressive of the wayfarer's gratitude. After accompanying the old man for a

short distance, the woman, on her return home, went to a cupboard for some linen, to make into a shirt for her child. She was aware that of the linen there were but three yards, but when she measured it, she found there were more. She measured off another three yards, but still there was a remnant. She then set to work, and continued to measure off, more and more, while the linen continued to lengthen in proportion. Astonished at the circumstance, she persisted in measuring, till she filled the whole of her cabin, and then her yard, and then she went forth into the fields, holding in her hands the end of the cloth, which still continued to lengthen, spreading itself upon the ground, like so many pathways upon the grass behind her.

At once delighted and surprised, she thus prolonged her work till nightfall. She had become rich. The event soon became known to the neighbours, and among others, to the ill-disposed woman. To the latter it was grievous to have missed such an opportunity for gratifying her covetousness. She now regretted having refused the old man a night's lodging, and with a view to rectify her mistake, and also to gain, possibly, still more than the good woman had done, she sought out the old man, and invited him to her dwelling. He came. Hiding her selfishness under a false appearance of benevolence, she prepared him a soft bed, and regaled him to the best of her power. On the following day the old man thanked her, and going out, said,

"For this day thou wilt have in abundance of whatever thou wilt first take in hand."

Hardly had the old man gone, when the woman, actuated with but one desire, hurried to her money, of which she determined to count out an immense quantity. Fearing, however, lest she might be robbed, she betook herself to a very solitary spot, where she might be unseen of any one. Before beginning to count her money, she wished to wash some coins that had got dirty, and for this purpose, on pouring some water over them, she found that the water would not cease flowing. It flowed and flowed, till herself, and her house, and her fields were completely drowned; and it is on that spot where now lies the Lake Gidden.

OUR SCHOOLS OF DESIGN.

The various schools of art and design are now doing excellent service to the young aspirants of the brush, by sending forth from their walls first-class teachers of drawing and painting, whose rigorous training of eye and hand renders them able masters and mistresses to government, public and private schools, and private families of the highest rank; and the teacher's first-class certificate is as valuable to the talented possessor, and as highly prized, as a "double first" to an University man. Since, then, there *are* places where drawing is correctly taught to students of both sexes at small cost, why do not *all* artists, who can possibly afford the time and expense, avail themselves of the privileges afforded by the Head Department of the Government Schools of Design, at South Kensington? Where, as at all the district schools, correctness of outline and distance are looked upon as the first, not last, principles of art; and where no students, however talented, are permitted to handle the brush till they can thoroughly and skilfully wield the pencil—in fine, they are taught to walk before they run; to spell before they read.

Some account, perhaps, of the Head School of "Art and Design," at South Kensington, whilst specially intended for the benefit of the artist, may not be either unamusing or instructive to the general reader, as to the scale of fees, daily routine of duty, and the general arrangement and conduct of the establishment. There are then two terms of sessions (as they are called) in each year, the first commencing in March, and terminating in July; the other in October, and ending in February. August and September are the long vacation months. At Christmas and Easter, a week's relief from duty is permitted: and gladly do the weary students avail themselves of the permission. The fees are but 4*l.* a session, which (not very large sum) includes admission to all the lectures. Hours of study from ten till four—a quarter of an hour being the prescribed time for luncheon. Each student is expected to provide himself or herself with an easel, large drawing board, maul stick, plummet, pencils, paper, india-rubber, case of instruments (containing large and small compasses with pen and ink legs, dividers, and scale), note book, T-square, and, if possible, a set of models for home study. The female classes are under the same roof, but quite distinct from the male schoolrooms. They receive the most careful instruction, under certificated mistresses; and the masters of the male schools, on certain days, attend to the more advanced classes. On first entering, the student is placed in the "Elementary Class" room, and a simple geometrical diagram given him to copy, always remembering that no measuring with strips of paper, or the pencil laid actually on the copy, is for one moment allowed; the former held at a distance and the eye alone are to be relied on by the would-be artists. For, at this early period of his art education, whatever proud ideas may exist in the scholar's own mind regarding his ability, the authorities think only of training the eye and hand to obey the mind. Gradually, progressive copies of "ornament" follow these simple diagrams, till step by step the student, rejoicing in his progress, attempts the magnificent prize piece, with its flowing curves and wreathing flowers. The horror and dismay with which these copies are at first regarded is almost ludicrous. "I can draw people, horses, dogs, houses, trees, any thing in short; but these detestable two-sided things," is the common exclamation of the dismayed beginner. But in these horrid two-sided monsters, the utility of ornament consists: for every leaf, point, curve, or flower, on either side, being exactly the same size, height and distance apart, the skill and patience of the novitiate is tried to the uttermost to make them agree: and for the first few weeks Mr. B.'s mark, Miss C.'s mark, are written in very legible pencil dashes on "broken-backed curves," "crooked verticals," and "ill-balanced points," without the slightest regard to the miserable student's feelings.

There are no half-measures of condemnation at Kensington; no making believe that a crooked line is standing straight, or that figures, drawn upon the inimitable Dutch-doll system, are perfect copies of flesh and blood anatomies. But, with iron gentleness, if we may so speak, every fault, however minute, is pointed out, and marked with the fatal black sign. Be sure, that when praise is awarded, it is most richly earned and deserved, or it would not have been received.

The Rubicon of "ornament" once passed, the student enters upon a course of model drawing, and the "figure from the flat" for which his previous studies have fully prepared him; geometry and perspective having been studied, hand-in-hand with "ornament." Models consisting of cones, cubes, vases, &c., are gracefully grouped in the class-rooms for the purposes of study, whilst once a week a lecture is given by one of the masters on the same subject (model drawing); when both schools, male and female, assemble in the lecture-room for a morning's hard work, the teacher stands raised above his pupils, and having "set up" a model in such a position that all may obtain a good view of it, executes a correct copy of the same, from his point of view, on the large black slate which occupies one end of the room, explaining at the same time to the attentive students the best method of measuring and drawing each line; after which, one hour is allowed for the completion of the lesson, by the expiry of which time every one is *expected* to produce a pretty correct copy of the model. No cheating at model drawing by forbidden measurements, or looking for assistance at our neighbour. For as no two persons can possibly obtain the same view of the cube, or whatever it may be, from the different dispositions of their seats, every student is thrown entirely upon his or her own resources for the completion of the task. Once or twice during the lecture the master examines carefully each individual copy, and then returns to his stand to await the termination of their labour. It is a highly amusing sight to watch a large number of students engaged in this branch of their studies. Suddenly, and as if moved by some spontaneous and irresistible impulse, thirty or forty right arms, with pencils in hand, firmly clutched between their fingers, are rigidly extended towards the model, exhibiting an infinite variety of young ladies' undersleeves, and gentlemen's more sombre coat sleeves. The left eye of each student being tightly screwed up, and in stern silence they effect their measurements. In a few seconds they fall as swiftly as they rose, and every one appears to be engaged in amateur scrubbing—to judge by the vigorous movement of the right arm—up and down the drawing-board. When Mr. C—— speaks all the scrubbing ceases instantly, whilst all eyes are turned somewhat confusedly on the speaker's amused countenance.

"Young ladies and gentlemen, I have been watching you for some time, and find that *every one* of you, without exception, have been rubbing out. I must beg you will *think* more before using your pencil, for it is great carelessness that causes such constant use of india-rubber, and I wish you would not use it at all."

In silence, and with many darting out arms at the model, as if hurling imaginary javelins at it, and many furtive applications of india-rubber, the lesson continues till the clock strikes—at the first stroke of which the lecturer leaps from his stand, and, finished or *un*finished, carries off all the drawings for private correction, and the scholars disperse to their several occupations. The lectures on geometry and perspective are conducted on precisely the same principle; the student following the master's diagram on the slate, line by line on their paper. The female anatomical classes are held in the summer, those for males in the autumn session. Those students *only* who are drawing from the "round" figures, &c., are expected to attend them. Strangers to the department can also attend these lectures at the moderate charge of ten shillings the course; and, singular as it may seem to all who shrink with horror and dismay at the very thought of the picture of a skeleton hand or foot, the anatomical classes are the *best* attended and the least shirked of any in the schools—yes, positively shirked, as several of them actually are. For the old school distich, applied to Kensington studies, and written by one of its harassed students in the moment of vexation, would most probably have run thus:—

> Ornamentation is vexation,
> All models are as bad;
> Geometry perplexes me,
> Perspective drives me mad.

These two last-mentioned studies are absolutely *detested* by the majority of the younger, and a great many of the *elder* students; and, if they can by any means avoid attending them, they will. And to confess the truth, there *are* easier tasks than obtaining clean, clear, correct geometrical and perspective diagrams, whether in pencil or in ink. And on examination days, woe be to those who are not "well up" in these absolute essentials of certificated merit. To model drawing succeeds the "figure from the flat," "ornament from the cast," and lastly, the "figure from the round." Let it be remembered that each of these studies must be thoroughly mastered in its outline before the pupil is permitted to attempt its shading. And, to those unacquainted with the inexpressible beauty of correct outline, the drawings exhibited annually at South Kensington appear all but marvellous. Take for instance that awfully-wonderful anatomical marvel, "the Laocoon." In the flat copy there is not one line of shading; yet we gaze at the "mere outline" completely fascinated by its terrible beauty. The straining eyeballs upturned in death's intensest agony. The heaving chest with its quivering muscles, starting as from the torture-stricken frame, are all so truthfully, so terribly expressed in simple outline, that it is impossible to gaze for any length of time on the school copy without shuddering.

If "the grand old masters" did not consider their dignity at all lowered by severe studies of anatomy, surely the young masters of the new school would do well to follow their example. We might then hope that in a very few years the entire race of deformed quadrupeds and bipeds

(those painted libels on nature) whom art has afflicted with crooked wooden legs, twisted shoulders, jointless arms, and worse than all (when a lady's in the case), distorted throats and countenances, would disappear, and no longer disgrace the canvas they were meant to adorn. And that in future no great works, otherwise of the highest order of art in every particular, would be deteriorated by that fatal want—the absence of correct outline and good drawing.

Intending students, of course, should inform the Head Master of Kensington what branch of art they particularly wish to study, and the time they can afford to stay; so that he may best advance their desired end. So, wishing all such well through ornament and perspective, we say farewell.

ISABELLA KENTISH.

THE DESERTED DIGGINGS.

BY AN OLD CHUM.

It was about an hour before sunset, on a beautiful day in early spring, that I rode slowly amongst the solitary heath-clad ranges of the once famous Kajunga diggings. For miles and miles the bed of every gully, the crest of every hill, and the broad surface of every flat, were thickly dotted with hillocks of pipe-clay heaped up near some fallen-in shaft, over the mouths of many of which windlass-legs, with here and there a windlass-barrel, were still standing. Three years before, every hill and gully in the district was thickly peopled. The site of tents and stores might still be easily traced on the ground, which, where they had stood, was hard and grassless, while on every side sod or log-chimneys—the latter, for the most part, entire, the former in various stages of decay—gave abundant proof how numerous had once been the dwelling-places of the digger. The country through which I had for some hours been travelling is in general barren and desolate in the extreme, badly watered and seldom affording even the scantiest feed, so that, once robbed of its gold, it had speedily relapsed into its former uninhabited state. The past winter, however, had been a remarkably rainy one, and, under the genial influence of the spring sun, the landscape had assumed the most beautiful appearance. The flats were emerald-green with young grass, while the ranges presented all the hues of the rainbow from the many-coloured heaths through which my horse made his way breast-deep. Thousands of wild flowers sprang up on every side, whilst overhead the wattle-blossoms, gleaming like gold amongst the delicate foliage, filled the air with perfume. The timber had been sadly thinned in old times by the axe of the digger, and by frequent bush-fires, but still many a noble white-gum stood in the flats, and the summits of the hills were clothed with the stringy bark and peppermint. Pausing on the top of a range a little higher than its neighbours to contemplate the beauty of the scene, my eye caught sight of something bright glancing amongst the trees to the north, which I at once guessed to be the Kajunga Creek, on the banks of which I meant to camp for the night. Giving my nag his head, he settled at once into that curious shambling gallop which an old stock-horse will keep up for hours, and in a few minutes I reached the creek on whose banks I found, as I had expected, very tolerable feed.

Dismounting, I took off the saddle and bridle, and placing them on the ground beside my blanket and cooking utensils, I hobbled my horse, and left him to go where he would; then, after a plunge in the creek, I kindled a fire, made my tea, toasted my chops on the end of a stick, and, having thoroughly satisfied my appetite, mixed myself a good stiff pannikin of brandy and water from my capacious flask, and, seating myself cozily on a log before the fire, lighted my pipe and began to smoke. The sun had now gone down some time, and the stillness of the starlit night was unbroken save by the rattle of my horse's hobbles as he changed his feeding-ground, and occasionally by the plaintive notes of the curlew, or the cry of the more-pork, the night-cuckoo of Australia.

Yielding to the potency of the grog and the soothing influences of the honey-dew, I had fallen into a semi-dozing state, when I was suddenly aroused by the sound of voices, and almost immediately afterwards three men stepped out of the gloom into the bright fire-light, and, with a hearty "What cheer, mate!" commenced making themselves comfortable for the night, much after the same fashion I myself had pursued an hour or so before. They were evidently all diggers, for I noticed the marks of the pipe-clay on their moleskins, and as they had only their blankets with them and no tools, I guessed, as was the case, that they must be on their road down to town. After they had supped, I produced the brandy-flask, and, as may be imagined, we fraternised at once. We talked upon various subjects; of the good old times, when gold was plentiful and diggers few—of the bad new times, when diggers abounded, but gold was, alas! scarce; of Eaglehawk; of the Balaarat riots, in which one of my companions had lost a couple of fingers; of dodging the police in the old licence-hunting days, and of a hundred other kindred subjects which, to an old gold-seeker, furnish an endless fund of amusement. I myself had handled the pick and rocked the cradle for many a long day, so that I was fully qualified to bear my part in the conversation. After some time, however, the current of talk slackened gradually, and at last we had remained silently smoking for several minutes, when one of my companions, addressing himself to another, a short but enormously powerful man, who was extended at full length before the fire, and whose face was so completely buried in hair that only the tip of his nose and his sharply twinkling eyes were visible, said:

"Bill, my boy! didn't you work somewhere hereabouts, once upon a time?"

"Yes," replied Bill; "about a matter of three years and a-half ago I worked on the old Kajunga, more by token, I had the best hole in Murder-will-out Gully that ever fell to my share since I first handled a pick."

"Murder-will-out Gully!" I exclaimed; "well, I have heard some queer names given to gullies and flats in my time, what with Dead horse, Lucky-woman, Peg-leg, Nip-cheese, Pinch-gut,

and such like, but that beats them all. Pray, why was it so called?"

"Well, you see, mate," said Bill, "I am not much of a hand at pitching a tale, but, as you seem the right sort, I'll try for once. It will be four years on the third of next month since first I came on to Kajunga. I had been working at Friar's Creek, in tucker-holes,* for some time previously, for my mate had been bad with the dysentery, and, of course, I couldn't leave him. At last, however, he died, and having been told that there were some old shipmates of mine up here, I determined to come up and try my luck. Well, I soon picked up with a fresh mate, and a pretty tidy hole, too, for there was gold galore in these parts then. There was a rare rough lot about here, though. You see, it was a goodish way from the old established gold-fields, and the diggings were scattered over such a deal of ground, that what few troopers we had up here went pretty nigh for nothing, so that every man of us used to sleep with his loaded revolver under his head, as in the old times on Golden Point. I was camped a few miles higher up the creek, and in the next tent to us were a couple of chaps who had been working there some time; but, partly through want of luck, and partly through blowing all they earned in the grog-shanties, they were pretty well always down on their luck. The name of the youngest of them was Charley Smart—Smart Charley we used to call him, though; for of a Sunday he used to come out in a grey shirt all worked with scarlet silk, a great red sash round his waist, a real Panama hat, breeches, and knee-boots, all which swell dunnage he had brought with him from California, where he and his brother, who was then away at M'Ivor, had worked for some time. He was a very good-looking young chap, though he was as white in the face as a parsnip, but he was uncommon strong and hearty, and an out-and-out good workman. His mate Alick—or Black Alick, as we used to call him, on account of the darkness of his skin—was a chap of about fifty years of age, and as ill-looking a customer as you could well meet with on a day's march, even in this country. I have heard since that he was tried in the old country for robbery and murder. There wasn't quite evidence enough to bring the hanging matter home to him, though there wasn't much doubt of his guilt; so he saved his neck, and came out to the colonies at government expense instead. He was a gloomy, morose kind of fellow, very quarrelsome when in drink, and as unsociable as a bear, for when he was out of cash to knock down in grog he used always to turn in as soon as ever he had swallowed his supper, never coming out to sit by the fire and smoke and yarn like the rest of us used to do. Smart Charley was quite another guess sort of chap. He would sit up half the night as long as any one was left to talk to, and seemed to dislike the blankets as much as Black Alick loved them.

"Now, a short distance from where we were camped, there was a grog-shanty—not one of your new-fangled, weather-boarded hotels, with a grand bar all set out with swell decanters full of bad liquor, but a jolly great tent, well put up, with a good fly over it, lined throughout with green baize, and a sod chimney to it that would hold an eight-foot log—as comfortable a crib as a man could wish to set foot in who was content to pour good stuff out of a black bottle, and drink it out of a pannikin. It was kept by a Yankee—a very fair specimen of one he was, too, and an uncommon good hand at drinks, to be sure. The way he could mix a julep was a caution. Well, a whole lot of us chaps used to frequent this shanty more or less, and, though I never was much of a one for drink, I used to go up pretty regular of a Saturday night, and have a hand at yuker or cribbage, and a glass or two of hot whiskey-and-water, real Scotch, and first-rate at that. The Yankee boys who came there said it was nothing to Monongohela; but Charley, who had been some time in America, said that that was all gas. However, as I never tasted the liquor in question, I can't say. Among the fellows who used the shanty—the 'Stars and Stripes,' as we called it—was one who dropped in occasionally, who went by the name of Indian Hepe, though he was no more an Indian than you are, for his father was a Scotchman and his mother a Mexican woman of Sonora; but he had been stolen away when a lad by the Indians who live on horseback—Comanchees, I think, they call them—and had passed pretty nigh twenty years of his life among them. I have heard that he became a chief, and had raised a deal of hair in his time; but whether this was true or not I can't say, for he was a silent sort of chap, and never said much about his past life. He had come on to the California diggings soon after they broke out, and afterwards came over to Sydney, and from there to Victoria. We used to think him a bit mad, for he would go away with his gun all alone for weeks, living upon what he could shoot, and when he came back to work he used to prefer spending half the night by himself in the bush, stretched out on his back, staring up at the stars, to sitting comfortably by the fire and smoking his pipe like a Christian. There were queer tales afloat about his having told some fellows' fortunes up on Eaglehawk, and how all he said had come true. Well, one Saturday night—I remember it well, for we had nuggeted pretty nigh thirty ounces that day—we were all of us up at the Stars and Stripes. Alick and Charley had been pretty well in luck that week, and they insisted on shouting * all round, time after time, till we all, I fancy, had taken a little more than was good for us, and even Hepe began to talk a bit. Charley seeing this began gammoning and chaffing him about his powers of fortune-telling. The Indian took it very quietly at first; but, when Charley went on too much at him, he got riled, and said he:

"'Charley, I can tell you something that will happen to you, as sure as you are sitting before that fire.'

"'What is it, Indian?' says Charley; 'speak up!'

"'Well, the best hole of the best rush that ever was or ever will be on Kajunga shall be found by you, and yet you will never handle an

* A tucker-hole is one that affords a bare subsistence.

* Shouting is Australian for standing treat.

ounce of the gold, and, what's more, those that work it will never profit by it.'

"At this we all laughed heartily, and says Charley:

"'If it's ever my luck to come across a bit of good ground, I should like to see the chap living that would jump* it, and I'd not only handle the gold but spend it, too. As to profiting by it, why that's another thing altogether; but if I didn't, the Stars and Stripes would, at any rate.'

"Hepe didn't make any reply, but sat quietly smoking his pipe for a bit, and then got up and went away. By this time Alick had begun to get nasty, and wanted to fight everybody in the shanty, one down the other come on, so I thought it time to make tracks for my tent and turn in.

"It seems that soon after I left, Alick and Charley had a bit of a barney, which ended in a regular stand-up fight, and when old Stars and Stripes attempted to separate them, they both went into him like mad, and beat him pretty nigh into a jelly before the other boys could get him away. He was precious savage at this, as you may think, and swore that neither of them should ever have another nobbler from him, either for love or money.

"A few days after this shindy the rush to the White Hills took place, and Alick and Charley got a capital claim, dead on the gutter. It was so good a one that they couldn't have knocked down all they made, even if they had had every night to do it in; but old Stars and Stripes wouldn't have them at any price, and, though there were lots of grog-tents in the neighbourhood, there wasn't a drop of decent stuff to be got nearer than the township, which was pretty well three miles off, with a rare rough road to it, bad enough to travel even by daylight—so they were obliged to lay by their gold, whether they would or not.

"For the first few Sundays they used to start off for Kajunga as soon as day broke, drink all day, and come reeling back just before sunset. But there had been ill-blood between them ever since the night of the row, and on the third Sunday they had another fight, and Charley drew his revolver on Alick—a bad habit he had learned over in California. There wasn't any harm done, for some of the boys who were present interfered; but there was no love lost between them from that day, and, though they still worked and lived together, they seldom or never spoke, and used to grub separate. Alick still kept up his Sunday journeys to Kajunga, but Charley never went down any more, turned quite steady, and saved up a heap of gold. This sort of game went on for three months or more, till one Wednesday evening, as we were sitting round the fire after supper, Charley says to me:

"'We shall have washed up by Saturday afternoon, Bill, and as I and Alick don't hit it any longer I shall start away on Sunday morning for Melbourne, and have a spree. I expect my brother Jack will get down there in a couple of weeks or so, and then we will either come up here again to prospect for the claim the Indian told me of, or try some fresh diggings. I rather think, however, I shall do the latter.'

"On Saturday night Charley came and had his supper with us.

"'It's my last night on the old Kajunga,' says he, 'I wish you would get old Stars and Stripes to let me in, I should like to shout for the boys once more before I go.'

"I went up to the shanty, and after a deal of trouble, I made it all right for Charley, but Alick he wouldn't have, do what I would, and I tried pretty hard, too. However, I might have saved myself all bother on his account, for it seems while I was away he came out of the tent, and Charley, who was as good-hearted a fellow as ever breathed, asked him to shake hands and have a nobbler, but Alick only swore at him and went in again. Well, we had a right down jolly night of it, to be sure. Stars and Stripes brewed us some stunning rum punch, and we had lots of singing and plenty of good yarns, and were very merry, without any of us getting much over the mark. Rather late Indian came in, for, like the rest of us, he liked Charley, and would have been sorry to let him go away without wishing him luck. Charley shook him by the hand.

"'Indian,' says he, 'I hav'n't found this grand hole yet, though I have had a pretty fair one, and can't complain.'

"'Wait a bit,' says Hepe, 'you'll find it, no fear.'

"Charley laughed, and was going to make some reply; but just then one of the boys began a song with a chorus as long as from here to the top of Mount Lofty, and we all joined in of course, and so the subject was dropped. We knocked off soon after midnight, and I walked down to the tent with Charley.

"'Good bye, old fellow,' says he, 'I sha'n't see you in the morning, for I shall be off by daybreak, and I know that you can do with a tidy amount of sleep on a Sunday. I sha'n't be long making town, for I mean to take nothing with me but the things I stand up in and my gold. The tent is Alick's, and if he leaves before I return, I have told him to let you have my tub and cradle and tools, and if I am not back in three months, why you are quite welcome to them. Good night, old chap, and good luck to you.' With that we went into our tents, and in a few minutes I was wrapped in my blankets and sound asleep. Just about dawn I was woke up by Charley, who was whistling away most vigorously as he made his fire and boiled the water for his tea. He wasn't long in finishing his breakfast, and then away he went on his journey as brisk as a bee. Instead of taking the main road which led to Kajunga, he passed right by our tent, and struck at once into the bush, intending, no doubt, to give the township a wide berth, which was a very sensible notion of his, as there were a deal of old hands and roughs loafing about it, and he carried a large amount of gold about him. As I was dropping off to sleep again, I thought I heard a slight noise as if some one was passing our tent on tip-toe, but as I was too sleepy to give much heed, and the dog which lay stretched out at the en-

* To jump a hole means to take possession of it under the pretence that it has not been worked for 24 hours, or that its owner possesses another claim.

trance of the tent didn't bark, I just gave myself an extra coil in the blankets, and was soon in the land of Nod. I seldom got up of a Sunday much before ten, but as my mate and I had agreed to go out on the plains that day after some turkey that had been seen about, and it being my week to cook, I roused out pretty early, lighted the fire, and set to work to get breakfast ready. I was busy frying the chops, when, looking up, I saw Alick coming along the road from the township. He had his gun under his arm and a brace of snipe in one hand.

"'Why, Alick,' said I, 'you have been out after the birds pretty early.'

"'Oh,' says he, 'Charley made such a cursed row this morning, that he woke me up, and, as I couldn't get to sleep again, I thought I would try if there was anything to be got along the creek. I have been pretty well all the way to the township, and this is all I've lighted on.'

"'Well,' says I, 'I hope we shall have better sport, at any rate.'

"'I hope you will,' says he; and into his tent he goes.

"Well, things went on pretty much in the old way with us for the next few weeks—the only thing in any way remarkable was the change that had come over Alick. Since Charley's departure he never shut himself up of a night as he used to do, but came out regularly and sat with the rest of us till the very last man went off,—and then even he did not seem much inclined to turn in himself. Not that he was a bit more pleasant than before, for formerly he used to speak now and then, but now he never so much as opened his mouth, but sat smoking and staring into the fire, and looking altogether as miserable as a bandicoot. Nobody cared about him for a mate—and indeed he never looked after one himself, but went and worked as a hatter * at some surfacing which had just been struck on the side of Ironbark Gully. The stuff wasn't very rich, but as there was a considerable depth of it, and it was very easy washing, being quite free from clay, and not requiring above two waters, he did pretty well at it. He had taken to save his money, too, for his Sunday journeys to the township were entirely dropped, and the Stars and Stripes wouldn't have him at any price, though he begged hard to be let in. Well, it may have been a couple of months or thereabouts after Charley left us that me and my mate were sitting one fine night in front of our tent doing our pipes. It was full moon, and pretty nigh as light as day. Alick had been working late, and was busy in his tent getting his supper ready, to cook which he had lighted a big fire not very far from where we were seated. I had just been talking to my mate about Charley, and was wondering whether he meant to come back for his things or to leave them for me, when who should I see come out of the bush just behind Alick's tent but Charley himself. He was dressed just the same as usual—gray shirt, red sash and all, but looked, if possible, a trifle more bloodless than ever. To my surprise he passed by the tent, and though I shouted out to him he took no notice, but walked straight over to the fire and sat down on a log which lay beside it, with his back towards us. Well, I was just going up to ask him what he meant by cutting a couple of old pals in that style, when out came Alick, carrying a billy full of soup in his hand, which he was going to warm up, and as he kept stirring it round while he walked, he did not notice Charley, who sat quite still, looking at the fire, without ever saying a word. Alick stooped down, settled the logs so as to make a firm place on which to set his pot, and as he lifted up his head after placing it on the fire, he caught sight of Charley. Never shall I forget his face, if I were to live a thousand years. For about half a minute he stood as still as if he were turned into stone—his mouth wide open, his eyes starting out of his head, and his cheeks as white as pipeclay; then, with a horrible yell, he fell head foremost in the fire. My mate and I rushed up, dragged him from amongst the blazing logs, and when we had done so, and turned round to look for Charley, he was gone. Well, I can tell you, I began to feel pretty scared, and no mistake.

"'Ned,' says I, to my mate, 'there's something wrong here. If that wasn't Charley himself it was his ghost, and I am sure if he had been living he would never have gone off like that, without having a talk with us and the rest of the boys.'

"'Nonsense,' says he, 'there ain't any such thing as ghosts.'

But though he pretended to laugh at the whole affair, and said that Charley was only having a game with us, I could see by his looks that he was more inclined after all to be of my opinion than of his own. However, we didn't have much time for talking, for all the while we were holding up Alick, who, though not very badly burned, was quite insensible. We carried him into his tent, and tried everything we could think of to bring him round, but as it was all of no use, my mate proposed that he should sit up with him one half the night, and I the other. Well, it might have been about midnight when my mate came and woke me up. 'Why,' says I, 'what's the matter with you? you look as white as a ghost?' 'Get up,' said he, 'and come along with me. Poor Charley, I am afraid it's all over with him.' As I couldn't get anything more out of him, I hurried on my clothes and went with him to Alick's tent. By the light of the candle, which stood on the table near the head of the bunk, I could see Alick's features plainly. He was asleep, but his face was perfectly livid, and the perspiration was rolling in huge drops down his forehead. For about a quarter of an hour he lay like this quite still, my mate and I watching him in silence. Suddenly, however, he raised himself up, and screamed out:

"'Keep him off! keep him off! he has come to drag me down to hell. His grave cannot hold him, and yet I buried him deep down, deep down. Mercy, my God, mercy, mercy, mercy!'

"His screams gradually grew fainter, and at last he fell back perfectly exhausted.

"'Has he been taken like that before to-night?' says I.

"'Yes, just before I came and woke you up.'

"'Well, you go and turn in now, and I will

* A digger who works alone is so called.

stay with him till morning, and then we'll think what is best to be done.'

"It might have been about daylight when Alick roused up all of a sudden. He sat up, looked round the tent, and seeing me seated on the opposite bunk, he exclaimed:

"'Why, what's all this? I must have been ill.'

"I didn't make him any answer, so he laid himself down again, and turning himself so that I couldn't see his face, he said, after a bit:

"'Where's Charley? Didn't Charley come back last night?'

"'Where Charley is, Alick,' said I, 'you best know.'

"'What do you mean by that?' says he, savagely, starting up, and facing me.

"'I mean,' says I, 'that you said things in your sleep last night that want explaining.'

"'What did I say?' says he.

"'Never mind the exact words,' says I; 'but I may just as well tell you that before my mate and me you said as much as that you had murdered Charley Smart.'

With that he dropped back on his bunk again, as if he had been shot. He lay a long time without speaking. At last he raised himself up on one arm, and, says he:

"'Bill, it's no use my keeping the matter to myself any longer. Charley's ghost came for me last night, and though I escaped him that time, it's all up with me I feel. I did murder him. I followed him that Sunday morning, and shot

him down in a gully a few miles from here. I hid his body in the scrub, and in the evening I went down and buried him, but his grave was not deep enough—his grave was not deep enough.'

"'Well, Alick,' says I, 'I didn't ask you to tell me all this, but now you have done so, I must do my duty.'

"'I know—I know,' says he. 'Let me go down with you, and show you where the body is buried, and then you may hand me over to the traps as soon as you like. I have been sick of my life this long time.'

"Well, I called my mate, and sent him up to the Stars and Stripes, where he found some of the boys who had come in for their morning-drink, and told them all about it, and a pretty row there was at once, as you may well think. Some of the Yankees were for lynching him right away, but the rest of us wouldn't agree to it, and at last it was settled that Alick should go down with us, and show us the grave; and that in order not to attract the attention of those whom we might meet on the road, he should not be bound. It was necessary to take the greatest care in order to get him safe into the hands of the troopers, for if the news of the murder had once got noised about the township, he wouldn't have had many minutes to say his prayers in, I can tell you. However, we put our revolvers in our pockets, and gave him

notice that if he offered to escape we would shoot him down like a dog. He led us right through the bush, without ever speaking, till he came to a very long gully with steep sides, and about the middle of it he stopped, and pointing to a great half-charred log, said :

"'Underneath that.'

"We rolled away the log and began to dig, taking it in turns. It was a lightish soil, and easy sinking ; so that working with a will, as we did, it wasn't very long before we reached the body.

"It was in a horrible state of decay, but still it wasn't so far gone, but what we could swear to it. We left some of our party with it, and then we started with Alick to take him to the police camp at Kajunga. Now, the creek, about a mile above Kajunga runs at the bottom of a tremendous precipice 300 or 400 feet in height, and along the top of this precipice lay our road. The scrub is very thick about there, and comes pretty well up to the edge of the cliff, so that there is but a narrow pathway of a few feet in width. Well, we had got almost within sight of the township, when who should come out of the bush about a hundred yards a head of us, but Charley. It was broad daylight, so that there was no mistaking him. Well, I can tell you, my heart beat double-quick, and I don't think that any one of us felt quite at his ease. Alick was walking by my side when he caught sight of Charley advancing towards him. With a yell of terror he rushed across the narrow path and flung himself headlong over the precipice. He did it so suddenly that none of us could even offer to prevent him. I sprang to the edge of the cliff just in time to see him strike heavily against a projecting granite boulder, and fall with a dull splash into the dark waters of the creek, which closed over him for ever. When I looked round I saw the supposed ghost gazing over the precipice with an expression of horror and amazement in his face.

"This can't be anything but a man, after all, thinks I, so I marched straight up to him, and I then saw at once that it was not Charley, though the likeness was so striking that at a short distance it would have deceived any one. The mystery was soon explained. He was Charley's brother, Jack Smart, who not finding him in Melbourne, as he had expected, had come up to Kajunga to look after him. The evening before, he had missed his way, and got up to our tents. He had not replied to my welcome, because, being very deaf, he had not heard it. Alick's extraordinary behaviour upon seeing him, had led him to believe that he was amongst a lot of candidates for the Yarra Bend,* so that while we were lugging Alick out of the fire, he quietly sloped into the bush again. Having worked for several years along with his brother in California, he had taken to dress exactly in the same style, which made the resemblance between them almost perfect. Well, you may be sure, when the news of all this reached the township, there was the devil to pay. Everybody knocked off work, and started off to see the place where the murdered man had been buried. There had been a pretty smart shower since we dug the body up, and as a Scotchman of the name of Campbell was looking at the grave, he saw something bright among the dirt that had been thrown up. He stooped down and picked it up, and what should it be but a nugget of pretty nigh three ounces, a small piece of which had been washed clean by the rain. Well, he jumped straight into the grave, and drove his pick in at once, and Rush Oh ! was the order of the day. Claims were marked out on every side, the corpse was left to the care of Jack Smart and the police, who had just come up, and the gully was soon alive with the whole population of Kajunga, mad with excitement. I had marked out a claim about fifty yards from the grave, claim as it was called, and was hard at work sinking for my bare life, when some one touched me on the shoulder. It was Hepe.

"'Well,' says he, 'what I said has come true. He found the claim, but he never handled the gold.'

"Well, whether it was chance or not, I cannot say, but everything Hepe told us, that night came to pass ; for that was the best rush ever known on Kajunga, and the grave claim was allowed on all hands to be the best hole on it ; and yet those who worked it never benefited by it, for the two Campbells who had it, after working it right out, all except one pillar, attempted to take that away without putting in proper props, so the roof of the drive fell in on them, and they were both killed. What became of the gold they took out of it was never known. No government receipts were found either on their bodies or among their things, nor could an ounce of gold be discovered though search was made wherever it was thought they might have stowed it away. My belief is that they planted it somewhere in the bush, but where, no one will ever know, for it ain't likely that pick or spade will ever be plied upon the old Kajunga again.

"'And what amount of gold do you think they took out of their claim ?' said I.

"'Well, me and my mate cleared nearly 2000*l.* a man after all expenses paid. The American hole, which was the best after Campbell's, turned out, I know, upwards of 5000*l*, so that I should think there must be between 5000*l.* and 6000*l.* lying somewhere handy if one only knew where to drop upon it ; but prospecting for that lot amongst all these wild gullies would be but a poor spec, I reckon. And now, mates, my yarn is clean spun out, and as we must be up with the sun in the morning, I shall say good night.'

"So saying, he knocked the ashes from his pipe, rolled himself in his blanket, and in a few minutes was sound asleep, an example we were none of us slow to follow."

AN OLD CHUM.

* The Yarra Bend is the Melbourne Madhouse.

A DEFINITION.

SHE asked the Professor : he shook his white head,
And tried very hard to be firm ;
"An Album is not much in *my* way," he said :
"Pray, madam, define me the term."

She smiled on his spectacles : quite shut him up
With a smile that all argument ends :
"Why, Doctor, I thought you'd been better brought up.
An Album's a HANDBOOK of Friends."

H. M. MOULE.

THE SILVER CORD.

BY SHIRLEY BROOKS.

CHAPTER LXXXIII.

It was late in the night, and the moonlight again lay upon Versailles, and Laura was at her window.

Her brother-in-law would see her early in the morning.

Versailles had long been silent, and the only sounds that came upon the ear of the watcher were the calm voices of the bells that told the hours, and the occasional sweep of the wind through the silvered trees. And little she heeded either, for her thoughts were of the same hour in an English home, and of children in the deep still sleep of happiness.

How long she had sat at that window she knew not. But she believed herself to be standing near the little bed of her youngest child, and softly drawing back the clustered hair from his forehead, when she heard her name uttered, and she was again at the foliaged window of her house of exile.

Startled, first, and then with a shudder that agitated her whole being, Laura made a faint effort to reply, but the word died upon her lips, and she became stone-cold with terror.

For she knew the voice but too well.

"You are there, I can see you," said Ernest Adair, distinctly, but not aloud.

But Laura could neither answer, nor make a sign, nor obey the instinct that bade her draw away from the window.

"You hear me, but you will not reply," he said. "It is not needful. You have the victory, and you have deserved it. But go to England, or your triumph will be useless. You hear me. Go to England."

Her hand had lain among the foliage, and an involuntary movement detached a leaf, and it fell.

"I understand you," said Adair. "That is a sign that you hear, and will obey my counsel. Lose no time, for death is busy among us. Farewell."

He picked up the leaf, but she did not see the action, and she heard no more. Henderson found

her on the bed, when morning brought the faithful attendant to the room, and Laura was lying near the wall, and with her hands tightly clasped over her eyes, as if to shut out some horrible image. Yet she had slept, thanks to the overmastering excitement of the past day, and she woke, pale as ashes and distressingly prostrated, but in full possession of self-consciousness.

In a few minutes, however, she sprang up, hastened to the drawer where she had placed the volume of letters so strangely obtained, and hurried from the chamber, which she would not enter again.

A small room on the lower floor was hastily arranged for her, and here she awaited the arrival of Charles Hawkesley.

Laura spoke not, and Henderson attended her with silent assiduity, placed before her food which the girl had to remove untasted, and performed such few offices of the toilette as Laura would bear.

"Stay in the room," were almost the only words that Mrs. Lygon uttered, and they were said in a tone of entreaty, all unlike her usual calm voice of gentle command. The girl stood and watched her, and counted the minutes until Hawkesley came.

Then, relieved from her guard, Henderson fled from the room and from the house. For her own inferior class of courage had fairly broken down, and she dreaded to be near Mrs. Lygon when the discovery of the truth should be made. Yet, true to her self-imposed duty, she lingered near the door, and expected to see Mr. Hawkesley rush out and hastily summon her to the aid of her mistress.

No such hasty summons came.

More than an hour passed from the time at which Hawkesley had entered the room. Then, Laura herself appeared at the door of the house, beckoned Henderson in, gave her orders to come on to Paris to an address in the writing of Mr. Hawkesley, and soon afterwards left the house with her brother-in-law.

The girl watched them as they went away, and observed that Laura kept her eyes upon the ground. This of course Henderson did not understand.

Nor did Charles Hawkesley. For, informed by Aventayle that the truth had not been told to Laura, Hawkesley had resolved to continue to withhold it until Mrs. Lygon had been removed from Versailles. It was his intention to conduct her to Paris, and then, if she would be guided by him, to escort her to England. But, in the meantime, he had the last duties to perform to him who had died in the house at Versailles.

They reached Paris, and on the way Charles Hawkesley explained to Laura that he wished her to remain there for two days, after which he proposed to take her to England. In the meantime he would place her in a lodging where she would be entirely freed from intrusion by friend or enemy.

"Have I an enemy?" said Laura, in a low voice.

He understood her, but made no direct reply. She gave a silent assent to the arrangement he proposed, and he drove with her to the lodging he had decided on, gave all directions for her comfort, and a special and private order that on no account should either French or English journals be brought to her. Then he took an affectionate leave of her, promising an early return, and left her, thoughtfully sending in a few books in the hope that Laura might avail herself of the poor yet not altogether unavailing distraction which any attempt at diversion of the current of the mind from its course of sorrow will sometimes bring to the weary.

But he might have spared this care. In another hour Laura was on the road to England.

CHAPTER LXXXIV.

Charles Hawkesley hastened to the bureau of M. ——, and, early as it was, he found that official in attendance.

"I suppose that I have nothing to tell you," said Hawkesley.

"Nothing," replied M. ——, with a manifestation of sincere sorrow—with a regret that was not a mere manifestation. "The past is past, and nothing so sad has chanced within my memory. I will not afflict you with my sympathy, Mr. Hawkesley, but be assured that I, too, have a right to be afflicted at the death of a brave, good man. I honoured him much, and when the time comes I may be able to prove to you that I have not used mere words of custom in saying this. It is more to the purpose that I should speak of the future."

"The necessary formalities—"

"Must be strictly observed, of course, but shall be performed with every delicacy and rapidity. You will desire to charge yourself with the details of the funeral. I will send to you a person who will make this duty as light as possible—who will carry out all your directions with perfect intelligence."

"I thank you, M. ——. And, now, has the murderer been arrested?"

"I am to conclude that you fix the deed upon one person only?"

"Have we not ample proof?"

"Of that we shall have to speak hereafter. But, be this as it may, the man Adair will be seized in due course. Up to within the last hour, he had not been captured."

"Surely it is impossible that he should escape?"

"I have seen such escapes that I have resolved to call nothing impossible to a clear-headed and resolute man, but I cannot doubt that we shall secure him, if it is desired."

"If it is desired!" echoed Hawkesley, astounded.

"I have, I see, given you a new thought, Mr. Hawkesley," said M. ——. "Do not reject it, however, merely because it has surprised you."

"Surprised is no word for what you cause in my mind."

"Listen, nevertheless, and once more let me beg you to believe in my assurance that I am profoundly grieved at what has chanced."

"You have used that word twice."

"It was accidentally, then, but we need not pause upon that. Mr. Hawkesley, I believe that if I resolve to capture this man Adair, I shall

have him. Whether I do so shall depend upon your own decision, and that I will not ask you to give hastily. In the meantime, beyond a certain *cordon*, Ernest Adair shall not pass. If you, on consideration, call for his arrest, it shall be made. But I am prepared to give you a stronger proof of my regard for the memory of him who is gone than you perhaps can appreciate. If you decide that it will be better for Ernest Adair to escape, that escape shall not be impossible."

"The assassin!"

"I will not try to enforce my own view by any o :the lesser arguments which have occurred to me. I will not urge on you that we have no proof of the origin of the final quarrel that ended so miserably—that the probabilities are all against its having been provoked by the weaker man, and not by the stronger—that French juries have sometimes a strange tenderness for a scoundrel whose history can be mixed up with a sentimental story like that of Adair's. I will suppose that he has committed wilful murder, and that he will be found guilty of it, and executed. What is now a mystery, save among a few relatives, and among some officials who are as mute as the tomb, will then become common scandal in Paris and London. It is not my duty—on the contrary, it is far away from my duty—to place this consideration before you; but I loved your friend, and I take all the consequences of setting all this before you."

"It does not weigh with me, M. ——," said Hawkesley. "Justice demands that the miscreant who betrayed my dear friend's honour, and who has taken his life, should come out on a French scaffold, and die."

"You speak of justice, but you mean vengeance. But that is a common confusion of thought."

"Let it be so," said Hawkesley, sternly. "I would myself stand by and see the wretch's head fall."

"Do you think that I do not share your indignation? But is there not a higher duty than the gratification of a just revenge? Will you resolve on proclaiming to the world that the noble-minded Urquhart was a dishonoured man?"

"He was not dishonoured," returned Hawkesley. "An honourable man is robbed, but the deed of the scoundrel who pillages him does him no dishonour, and the crime of a bad man and a bad woman inflicts no shame upon the memory of Robert Urquhart. He suffered a great misfortune, and we will punish the villain who inflicted it."

"Come and say this to me in six hours, and I will act upon what you say. But there will be one thing more for you to consider. Were the name and fame of Urquhart alone involved, and as he has happily left no children to bear the brand of disgrace, specially no daughter whose husband the world will call a bold man, there might be nothing more to say, and I would telegraph that Adair should be at once arrested. But the subject of our interviews in this room, Mr. Hawkesley, has not been the misfortune of Adair, but of another equally honourable man, whose reputation you were still more eager to protect."

"Lygon. I have thought of that," said Hawkesley.

"You could not fail to think of it. But have you considered well what must inevitably happen if this criminal procedure continues? Do you think that Adair on his trial will be more reserved than Adair in this room? Will he, in view of the guillotine, respect the name of your sister?"

"Do you not know that we have seized the letters, M. ——, the villain's proofs, as he calls them?"

M. ——'s well-trained features gave no sign that he was hearing news. But he said:

"I learn this for the first time, Mr. Hawkesley, and I own it to you with perfect frankness. Others will have to explain how it is that I hear it first from you. But accept my admission as another proof that I am acting loyally by you. Who has the letters?"

"Mrs. Arthur Lygon."

"That, then, was the packet which you carried when she left the terminus with you, and you drove away to the lodging. They should have known better than to describe it as—as a dressing-case," said M. ——, taking up a scrap of paper that lay beside him. "It is in Mrs. Lygon's possession, of course?"

"Yes, and he will be a shrewd man who gets it from her keeping."

"We are on grave business, and it is not worth while for me to invite you to come in three hours and see it on this table," said M. ——. "Let it remain in the poor lady's keeping—she clings to it doubtless as a sheet anchor. Yet will your possession of it prevent scandal? Will not Adair rejoice in describing its contents, and in challenging you to produce the letters?"

"Who will believe a miscreant and assassin?"

"The world, which always believes the worst. And, besides, the letters are inextricably mixed up with the case. It is impossible that the treacherous revelations of Adair can be checked, if he is once arrested, unless, of course," added M. ——, with no affectation of coolness, but in the tone of remonstrance which he had hitherto employed, "unless he should be permitted to evade a trial by placing himself beyond the reach of this world's justice. Of this I fear there is no chance. He will have leisure in confinement to calculate the odds too well. He would be a fool to destroy himself. If he lives, he will reveal the double mystery which has come into his keeping."

"How was it," said Hawkesley, with a passionate oath, "that Urquhart failed to crush the very life out of him!"

"Aye," repeated the other. "It was strange. So strange that those may be pardoned who believed that the issue which has happened would be impossible, and therefore left events to take their course."

"What do you mean?"

"No matter. I will tell you another time. Now, will you leave me? You have a melancholy occupation before you, and that claims your first attention. I will send to you, as I have said, a man whom you can trust. Afterwards, Mr. Hawkesley, give your best consideration to all that I have said. Remember, I am counselling you neither way, but I am setting the whole case before you, and I am ready to act as your calm

judgment may decide. You have before your eye a grim picture of a merited punishment. We may never be able to realise it. But, Mr. Hawkesley, even if we should, shall we have done what is best and kindest? It is a good sight to see a scoundrel's head fall where it can plot crime no more, but it is a better sight to see a loving woman restored to the arms of her little children. Choose which picture you will have, and come to me again. And I swear to you that nothing shall be lost by your taking time for consideration."

"He will not escape?"

"Nothing shall be lost."

At this moment a signal was given that a subordinate had something to communicate, and the drawer in the wall gave M. —— another scrap of paper. He read it quickly.

"Stay, Mr. Hawkesley," he said. "I have something for you. Do you know that Mrs. Lygon is now at the Northern Railway, about to depart for England?"

"It is impossible!" exclaimed Hawkesley.

"It is true—read for yourself."

And he handed across the scrap of paper, which contained the information he had given.

"What does this mean?" said Hawkesley, bewildered.

"She is alone, you observe."

"Alone, too."

"That is of no consequence. And she had better return alone than in the society in which she came over to France."

"You put a thought into my head. What if that fiend is again upon her track."

"Be calm," said M. ——, laying his hand on Hawkesley's arm. "I give you my word of honour that Ernest Adair is within four miles of the house at Versailles. He has nothing to do with her journey."

"If he appears before her, he will kill her," said Hawkesley.

"He will not appear before her, I tell you, and why should he attempt a new violence? Ah, the letters!"

"No, I do not mean that, I do not mean that. We have not told her who has fallen—she believes that it is her enemy."

"Ah! And the world is now clear before her, and she rushes back to England fearlessly, the first moment that she is set free. A brave lady. You must not stop her, Mr. Hawkesley; we can do so, of course, at the first station, on pretext that we want her as a witness, but it must not be. Let her go."

"Go—I am rejoiced that she has gone, though she might have trusted me with her intentions. But she has gone with a belief that *he* is dead, and when she learns the truth—"

"Yes, let us consider. That complicates her position, poor lady. And yet let her go. Mr. Hawkesley—may I ask you a question which implies the most offensive suggestion, and yet—"

"You would ask whether I believe her innocent. Yes, as God shall judge me."

"Then let her go home."

"I will not seek to stop her. *Can she have seen her husband?*"

"We will ascertain."

He wrote some lines, despatched them, and renewed the conversation.

"Have you, Mr. Hawkesley, informed Mr. Lygon of the truth? No, I know that you have not done so personally, for you passed the night at Versailles, but you may have written."

"I thought it better to entrust the mission to Mr. Aventayle, as I had little time to spare, and Mrs. Lygon was, of course, my first consideration."

"You sent him up; but has he discharged the duty?"

"I go from hence to the hotel."

"It might be well not to go without knowledge as to whether the lady has met her husband. Shall I ask you to wait?"

M. —— went out, and Hawkesley was left to revolve the question whether Urquhart should be avenged, or Laura should be saved from a new peril.

But, upon this occasion, he was not allowed very long to deliberate. M. —— came in to him with the double information that neither Mrs. Lygon nor Mr. Aventayle had seen Arthur. The former fact was stated, the second was equally clear, for Lygon had not opened the door of his room since the preceding night. It was not the business of the chief of the police to know how this had been ascertained, but his employé knew that the door in question opened outwards, and the rest of the evidence was simple enough.

"Then it will be my business to tell him," said Hawkesley.

"Yes," said M. ——, "and also, if I may suggest this, to ascertain his thoughts on the subject on which we have spoken."

"Possibly," said Hawkesley, thoughtfully.

"He is surely, of all persons, the most interested in the decision," said M. ——.

"It is true. When can I see you again, M. ——?" said Hawkesley, somewhat abruptly changing the immediate subject before them.

"Always. But do not hasten. I have told you that time is not of vital consequence. One thing more. You have sent the truth to England. Your friend Aventayle has telegraphed in your name."

"Yes, I begged him to do so."

"I mention it only because in the event of Mrs. Lygon going to the house of her sister, the facts will at once become known to her."

"That is true," said Hawkesley, "and it did not occur to me."

"Why should it? You had intended to break the truth yourself to Mrs. Lygon."

"This is most painful!" exclaimed Charles Hawkesley, walking about the room in excitement. "Why did she not remain, as she promised?"

"I must not ask the reason of your vexation."

"Yes," replied Hawkesley, frankly, "it is this. I have desired my wife to tell the terrible news to her sister Bertha, who is now lying ill in my house. The scene will be a most sad and agitating one, and I did not think of causing my wife the second affliction of having to make the revelation to Mrs. Lygon, who will hasten to her with the belief in which she has left Paris."

"Your concern at this moment is for your own wife."

"Certainly it is. Does it appear strange to you?"

"Do not speak with irritation. I was plotting how to meet this new trouble, Mr. Hawkesley. There is a way, of course, but to adopt it would be to stop Mrs. Lygon in her journey."

"What is it?"

"I could easily cause the truth to be told to her at Boulogne, or at Folkestone—or perhaps—yes, I will undertake to let it meet her on her arrival in London."

"No. I will not cross her path with another grief. If she goes to her sister's, let her learn the truth there. No one will tell it her more gently, or advise her more wisely."

"This is for yourself to decide. Should you think differently some hours hence, there will still be time to interpose."

"I will now go to the hotel."

"To remain there, if you will, until a person comes to you from me. After you have dismissed him, it will be for you, Mr. Hawkesley, and for your brother-in-law, to decide on the very grave consideration which I have taken the liberty of suggesting.

"Grave indeed," muttered Hawkesley, as he went out, "and I find myself exchanging smooth words over the question whether an infernal murderer and villain shall escape us. It is like a dream—it is like a dream."

CHAPTER LXXXV.

Cautiously and thoughtfully as the telegraphic message, dispatched by Aventayle to Mrs. Hawkesley at the request of her husband, had been worded, in order to soften as far as possible the epigrammatic curtness of such messages, and to do away with the startling effect which the hardness of the official hand, in lieu of that wont to be so welcome, produces upon those unaccustomed to such communications, there was still the cruel fact which no care could render less cruel. Beatrice learned that her husband's valued friend, the husband of the feeble woman on the sick bed above, had been stricken down in his strong manhood, and that her weak sister was a widow. Shocking as was the news, melancholy as was the thought that he concerning whom it was sent had been the subject if not of harsh judgment, of suspicion and mistrust on the part of Beatrice when she last wrote, it was far more shocking to her when she came to recal the circumstances under which he and Bertha had parted for ever, and the nature of the revelation which it became her duty to make to the scarcely penitent creature who manifested so inadequate a sense of her sin, so vague a dream of her future.

For herself, Mrs. Hawkesley, with some self-reproach, owned that horror had more share than actual grief in the sensations with which she had to struggle. That she had never thoroughly liked, perhaps had never thoroughly appreciated Urquhart, has been made clear in an earlier part of our story. The negative feelings with which she had regarded him had been altered into something almost resembling hatred by the circumstances which have been told. Chiefly had his unhesitating judgment on Laura, his imperative demand that Lygon should be convinced of her worthlessness on the strength, not of evidence examined by himself, but of testimony that had been conclusive to Urquhart, confirmed Beatrice in her hostile feelings towards him, nor had they been softened by the effect which Robert Urquhart's sentence had produced upon the mind of her own husband. She was the best of wives, and not the less so that she had the genuine wifely belief that the best of husbands submit to few influences save those of home. Beatrice, therefore, was well prepared to be impressed, even by the careless and non-consequent tales of Bertha, and at the moment of the arrival of the despatch she had no inclination to retract a syllable of the imputations which she had conveyed to her husband.

Then came the telegraph message, and Urquhart was gone, and that strange revulsion, which the head cannot justify and which the heart cannot refuse, that disposition to see only what was good in those who are no longer with us for good or for evil, followed, and Beatrice's affectionate nature was more afflicted than she could have imagined possible from aught connected with the stern, rough Urquhart. Before she could give herself up to the task of breaking the news to her sister, Mrs. Hawkesley had her own self-rebuke—remorse were too strong a word—to deal with, and it was with a doubly sorrowful heart that she addressed herself to the thought how she might in the gentlest manner open to Bertha the tidings that he whom she had so wickedly wronged was beyond the reach of her penitence.

"Aunt, I wish you would not have letters," said little Fred Lygon, who had stolen into the room where Beatrice, not heeding him, was once more reading the message.

"Do you, darling?" said his aunt, too accustomed to the ways of childhood to be startled at any child-appearance from any quarter in which playfulness could reveal itself. "Why, dear Fred?"

"Because letters make you look ugly. Tell the postman not to bring any except they come from mamma or papa."

She kissed the child, and went to her own room, whence, after some time, she passed across to Bertha's, with a tremor foreign to her usually calm nature.

"I thought that you were never coming any more," said Bertha, raising herself in the bed, and speaking fretfully.

"I have not been away long, dear," answered Beatrice, more gently, perhaps, than she would have replied on another occasion. "I had a good many orders to give, and most of them were for you."

"It is more than an hour," persisted Bertha, "for I have heard the church clock strike twice; but you think that because I am ill in bed I must believe anything you like to tell me."

"My dear Bertha," said Mrs. Hawkesley, coming near her, "you cannot feel that you have been treated with any neglect here. I am sure that it has been a labour of love with us all to do all that we can for you."

"I am not complaining," retorted Bertha. "You are always finding fault with me, and I wish I were dead."

"Bertha," said her sister, very gravely, "do not speak lightly of death. It may be that you will hear of it sooner than you expect."

"Preaching does me no good, Beatrice, as you might know by this time. I am much obliged to you, of course, for all that you have done, and to Charles for having brought me home here, but what has happened has happened, and we cannot alter it by talking. I wish I were well enough to go away from you all, and not be a trouble and a shame to those who must hate me."

"You have no right to talk in this unkind manner, Bertha, dear. I think that you are stronger and better to-day, and I want to speak to you very seriously, but not in the way of preaching, as you call it, though I am sure you have not heard much that deserves the name, and nothing that has not been meant affectionately."

"Give me some of the lemonade. It is not fresh, and it is quite warm, but it is good enough for me."

"Fresh is being made for you, dear. Now, can you listen to me for a few minutes, as I have something to say which you must hear?"

"If I must I must, and it is of no use asking. I dare say that I am as well to-day as I shall be to-morrow."

"I have a letter from Paris, a very sad letter."

"What has happened?" said Bertha, eagerly. "He is not coming over after me—do not say that."

"Indeed he is not."

"You are quite certain?"

"Bertha, I have a message for you which you will remember to the last hour of your life," said Beatrice, desirous to bring her sister into a more fitting frame of mind to receive the fatal intelligence.

"It is of no use sending me reproaches. As soon as the doctor will let me, I will go away, and be out of the reach of you all."

"And where will you go, Bertha?"

"I do not know. I suppose Charles will advise me. I suppose that *he* will do something for me when he has calmed down, and will not let his wife be without the means of living."

"Whom do you mean by he?"

"Whom should I mean—my husband."

"You have no husband, Bertha."

"Beatrice," said Bertha, clutching at her sister's arm. "What do you mean? He has divorced me?"

"You are divorced indeed."

"But that is impossible. It is not true, Beatrice; you are saying it to work upon me. There are no divorces in France. I know that, though you think I know nothing. It is wicked of you to play upon my feelings."

"You are divorced for ever, Bertha. Mr. Urquhart is gone."

"Gone!"

"He is dead."

Mrs. Hawkesley turned away, that she might not see the agitation which she felt that her words must produce in the face of her sister. Beatrice even listened for the rapid breath, for the sob, but she heard nothing, and her immediate impression was that Bertha must have fainted. The next instance Beatrice was about to throw her arms round Bertha, but paused, so utterly different was the result of her words from that which she had expected.

Bertha was lying back on her pillow, but her cheek had not lost the fever flush, and her eyes, undimmed with tears, were even brighter than before. She was muttering something, but Mrs. Hawkesley was too much shocked to seek to hear what it was—and as she looked, the expression on her lip was assuredly not that of grief, and Beatrice struggled against the impression that it partook of an opposite character. There must have been seen in Beatrice's face something of the indignation which she felt, or else Bertha's own conscience must have accused her of heartlessness, for she raised herself, and said, though in no tone befitting the occasion—

"It is very shocking. How did it happen, Beatrice?"

"Suddenly."

"Ah! He told me more than once, poor fellow, that he knew that it would be sudden when it came. Poor Robert!"

And she hid her face in her handkerchief, but when she withdrew it, there were no tears glistening on her cheek.

"It was sudden indeed, Bertha. He died a violent death."

"My God! One of his railway accidents—was it so, Beatrice?"

"He died by the hand of a murderer."

This time the face of Bertha became white indeed. The fearful news had found its way to her selfish heart, and in the agitation with which she clung to Beatrice there was no feigning.

"Don't tell me that. Say it is not so, and that you were only trying me?"

"Do you dare to think that I would speak falsely on such a matter? Bertha, your husband, your noble husband, has been killed in his own house, in the house that was yours until you left it of your own will."

"Do not speak to me so. I am too weak to bear it, I am indeed. Tell me—no, do not tell me until I am stronger. He has been killed. Was it a robber that broke in—yes, tell me that and no more."

"He has been killed by the worst of robbers—by the man who robbed him of the heart of his wife."

Bertha gazed at her for a few moments, and then, with a sort of cry, said,

"You are speaking falsely to me after all. He is dead—yes, and he has died of a broken heart—say it is so."

"His heart was too proud to break for what you could do, Bertha," replied her sister. "He has been killed, I tell you, and the man who has killed him is Ernest Adair."

"Then Robert must have attacked him, and Adair must have acted in self-defence. It is very dreadful, but it must have been so, and every one has a right to defend himself. But it is very dreadful," she repeated, shrinking from under the kindled eye of her sister.

"It is dreadful," repeated Mrs. Hawkesley, slowly, "but not so dreadful as this. And your first impulse is to find an excuse for the murderer."

"No, no, I did not, I do not. I was only saying—how eager you are to judge me!—I was only saying how it must have been, for I remember that poor Robert declared he would one day be the death of Ernest."

"Of Ernest?" said Mrs. Hawkesley, bitterly. "Can you use the name as if—O! I cannot speak to you, Bertha. May it please God to bring you to a fitter state of mind! I cannot speak to you. There is the telegram; read it if you please, and if you can, pray to be forgiven the fearful wickedness which has brought a good man to such a grave. Oh! Bertha, Bertha!"

And, weeping the only tears which had been shed at that interview, to which she had looked with so much agitation, Beatrice hastened from the room.

"What would she have had me say," murmured Bertha, when she was alone. "Throw myself back in an agony, and declare that I loved him better than my life. I did not, and I will not say so."

(To be continued.)

SHADY VALLEY.

The time was toward the heats of June,
And all the mellow afternoon
With my ripe heart was just in tune,
As I lay a-dreaming.

For yes, my heart was ripe with love;
The very airs that stirr'd the grove
Blew kisses o'er me from above,
As I lay a-dreaming.

The river glided smoothly by—
The blue bright bird shot silently
Between my covert and the sky
As I lay a-dreaming.

By drooping alders doubly bound,
The water slid without a sound
Until, below the rooted ground
Where I lay a-dreaming,

It smote a bank of ruddy loam,
Where, underneath, a secret dome
Of pebbles fretted it to foam
As I lay a-dreaming.

But further, where the stream was wide,
The kine were standing side by side
Cooling their knees against the tide,
As I lay a-dreaming.

And still beyond, were orchards green,
Red cottage roofs, and in between
Bright meadows, where the scythe had been
While I lay a-dreaming.

And over all, the hollow hills,
Fill'd with that purple light, which fills
Our hearts too with such regal thrills,
As we lie a-dreaming.

But my low nest was shut within
To such a leafy calm, wherein
My thoughts went freely out and in
As I lay a-dreaming.

The squirrel on his branch at play—
The blossom falling from the may—
No creatures moved but such as they,
Where I lay a-dreaming.

So sweet a spot, so soft a breeze—
Such beauty of enfolding trees!
Ah! what could mar my luscious ease
As I lay a-dreaming?

A country wench came by, to see
Whereas her missing kine should be;
And this is what she said to me
As I lay a-dreaming:

"Git up, ye dawdlin' gaapin' loon!
Ah'd liever gang mah wa-s to t' toon
An' fettle t' sheep this efternoon
Nor lig theer a-dreamin'!"

I look'd at her in strange surprise:
I could not think in anywise
She was an angel from the skies,
Though I lay a-dreaming.

For oh, too deep was the disguise:
The hand with which she veil'd her eyes
Seem'd like a Titan's hand in size,
As I lay a dreaming.

She was a woman though, and young—
The very creature I had sung
In fancy, with a poet's tongue,
As I lay a-dreaming.

Therefore I spake and answer'd her:
"Maiden, you do but come to stir
My soul, and make it joyfuller
To lie here a-dreaming.

"For you too, gracious as a fawn,
By ferny glade and mossy lawn
Full oft have loved, at eve or dawn
To lie thus a-dreaming.

"And all the interwoven grace
Of sound and hue that fill'd the place
Has doubtless 'passed into your face,'
As you lay a-dreaming.

"Oh, you then, nursed in summer woods,
And lull'd by rolling waterfloods,
Will give me leave, in these high moods,
To lie here a-dreaming."

The maiden stared, but answered not:
Yet, striding slowly from the spot,
I heard her say—I know not what—
As I lay a-dreaming.

"Yon chap's a snivellin' tiv hissell,
An' wat he meeans Ah canna tell;
He's daft, Ah doot, or drunk wi' yell
Te lig theer a-dreamin'."

Arthur J. Munby.

QUEER CULPRITS.

According to Jewish law, "If an ox gore a man or a woman, that they die, then the ox shall be surely stoned, and his flesh shall not be eaten: but the owner of the ox shall be quit." After giving this command, Moses proceeds to enforce the doctrine of the responsibility of the beast's owner, and to ensure his punishment, should he wittingly

let a dangerous animal run loose; also to make provision for his security under some extenuating circumstances. These commands were carried into the laws of mediæval Europe; the jurists, at the same time, introducing refinements of their own, and enforcing them in numerous cases, which afford matter for curious inquiry, and are full of technicalities and peculiarities, at once amusing and instructive, as throwing light on the customs and habits of thought in those times.

Now take the case of a child injured by a sow, or a man killed by a bull: the trial was conducted in precisely the same manner as though either sow or bull were morally criminal. They were apprehended, placed before the ordinary tribunal, and given over to execution.

Again: an inroad of locusts or snails takes place. Common law is helpless, it may pronounce judgment, but who is to execute its decrees? Temporal power being palpably unavailing, the spiritual tribunal steps in; the decision of the magistrates being useless, perhaps excommunication may suffice. This, then, was an established maxim. If the criminal could be reached, it was handed over to the ordinary courts of justice; if, however, the matter was beyond their control, it fell within the jurisdiction of Ecclesiastical Courts. Poor culprit, not a loop-hole left by which to escape!

Let us consider the manner of proceeding under the former circumstance. A bull has caused the death of a man. The brute is seized and incarcerated; a lawyer is appointed to plead for the delinquent; another is counsel for the prosecution. Witnesses are bound over, the case is heard, and sentence is given by the judge, declaring the bull guilty of deliberate and wilful murder; and, accordingly, must suffer the penalty of hanging or burning.

The following cases are taken from among numerous others, and will afford examples:—

A.D. 1266. A pig burned at Fontenay-aux-Roses, near Paris, for having devoured a child.

1389. A horse tried at Dijon, on information given by the magistrates of Montbar, and condemned to death, for having killed a man.

1386. A judge at Falaise condemned a sow to be mutilated in its leg and head, and then to be hung, for having lacerated and killed a child. It was executed in the square, dressed in man's clothes. The execution cost six sous, six deniers, and a new pair of gloves for the executioner, that he might come out of the job with clean hands.

1499. A bull was condemned to death at Cauroy, near Beauvais, for having in a fury "occis" a little boy of fourteen or fifteen years old.

A farmer of Moisy let a mad bull escape. The brute met and gored a man so severely that he only survived a few hours. Charles, Count de Valois, having heard of the accident whilst at his château of Crépy, ordered the bull to be seized and committed for trial. This was accordingly done. The officers of the Count de Valois gathered all requisite information, received the affidavits of witnesses, established the guilt of the bull, condemned it to be hung, and executed it on the gibbet of Moisy-le-Temple. The death of the beast thus expiated that of the man. But matters did not stop here. An appeal against the sentence of the Count's officers was lodged before the Candlemas parliament of 1314—drawn up in the name of the Procureur de l'Hôpital at Moisy, declaring the officers to have been incompetent judges, having no jurisdiction within the confines of Moisy, and as having attempted to establish a precedent. The parliament received and investigated the appeal, and decided that the condemnation of the bull was perfectly just, but found that the Count de Valois had no judicial rights within the territory of Moisy, and that his officers had acted illegally in having taken part in the affair.

Here is a list of the expenses incurred on the occasion of a sow's execution, for having eaten a child:—

To the expenditure made for her whilst in jail . 6 sols.
Item. To the executioner, who came from Paris to Meulan to put the criminal to death, by orders of the bailiff and the Procureur du Roi . . . . 54 sols.
Item. To a conveyance for conducting her to execution . . . . 6 sols.
Item. To cords to tie and bind her . 2 sols. 8 deniers.
Item. To gloves . . . . . 2 deniers.

The charter of Elenora, drawn up in 1395, and entitled "Carta de logu," containing the complete civil and criminal code for Sardinia, enjoins that oxen and cows, whether wild or domesticated, may be legally killed when they are taken marauding. Asses convicted of similar delinquencies—common enough, by the way—are treated more humanely. They are considered in the same light as thieves of a higher order in society. The first time that an ass is found in a cultivated field not belonging to his master, one of its ears is cropped. If it commits the same offence again, it loses the second ear; should the culprit be hardened in crime, and inveterate enough to trespass a third time, it is not hung, does not even lose its tail, but is confiscated to the crown, and goes to swell the royal herd.

During the fourteenth and fifteenth centuries, the guilty animals suffered death on the gallows, and our sires considered that such a punishment must strike terror into the minds of all cattle owners and jobbers, so as effectually to prevent them from suffering their beasts to stray at large over the country. Later on, however, these capital condemnations were done away with, the proprietor of the animal was condemned to pay damages, and the criminal was killed without trial.

One more specimen, and we shall pass to cases coming under Ecclesiastical Courts.

Country folk believe still that cocks lay eggs. This is an old superstition, people holding, formerly, that from these accursed eggs sprang basilisks, or horrible winged serpents.

Gross relates, in his "Petite Chronique de Bâle," that in the month of August, 1474, an abandoned and profligate cock of that town was accused of the crime of having laid one of these eggs, and was brought before the magistrates, tried, convicted, and condemned to death.

The Court delivered over the culprit to the executioner, who burned it publicly, along with its egg, in a place called Kohlenberger, amidst a

great concourse of citizens and peasants assembled to witness such a ludicrous execution.

The poor cock no doubt suffered on account of the belief prevalent at the period that it was in league with the devil. A cock was the offering made by witches at their sabbaths, and as these eggs were reputed to contain snakes—reptiles particularly grateful to devils—it was taken as a proof of the cock having been engaged in the practice of sorcery. "There is nothing, then, remarkable in the fact that, at a time when superstition did violence to religion, reason and law, an unfortunate cock should have been condemned to the flames, along with the egg it was reputed to have laid, since that egg, in the mind of the judges even, was regarded as an object of legitimate terror—as the production of a demon."

We shall pass now to the second part of our subject—namely, proceedings against snails, flies, mice, moles, ants, caterpillars, &c.

It has frequently happened, in all parts of the world, that an unusual number of vermin has made its appearance and destroyed the garden produce, or that flies have been so abundant as to drive the cattle mad from their bites. In such cases the sufferers had recourse to the Church, which hearkened to their complaints and fulminated her anathema against the culprits. The method of proceeding much resembled that already stated as being in vogue in the ordinary tribunals. The plaintiff appointed counsel, the court accorded a counsel to the defendants, and the ecclesiastical judge summed up and gave sentence.

All requisite legal forms of law were gone through with precision and minuteness, to exemplify which we shall extract some details from a consultation on the subject, made by Bartholomew de Chasseneux, a noted lawyer of the sixteenth century.

After having spoken, in the opening, of the custom among the inhabitants of Beaume of asking the authorities of Autun to excommunicate certain insects larger than flies, vulgarly termed *hurebers*, a favour which was invariably accorded them, Chasseneux enters on the question whether such a proceeding be right. The subject is divided into five parts, in each of which he exhibits vast erudition.

The lawyer then consoles the inhabitants of Beaunois with the reflection that the scourge which vexes them devastates other countries. In India the *hurebers* are three feet long, their legs are armed with teeth, which the natives employ as saws. The remedy found most effectual is to make a female in the most *dégagé* costume conceivable perambulate the canton with bare feet. This method, however, is open to grave objections.

The advocate then discusses the legality of citing insects before a court of justice. He decides that such a summons is perfectly justifiable. He proceeds to inquire whether they should be expected to attend in person, and, in default of their so doing, whether the prosecution can lawfully be carried on. Chasseneux satisfies himself and us that this is in strict accordance with law.

The sort of tribunal before which the criminals should be cited forms the next subject of inquiry. He decides in favour of the Ecclesiastical Courts. The advocate proceeds to convince his readers, by twelve conclusive arguments, that excommunication of animals is justifiable; having done so, he brings forward a series of examples and precedents. He asserts that a priest once excommunicated an orchard, whither children resorted to eat apples, when—naughty chicks!—they ought to have been at church. The result was all that could be desired, for the trees produced no fruit till, at the request of the Dowager Duchess of Burgundy, the inhibition was removed.

He mentions, as well, an excommunication fulminated by a bishop against sparrows which, flying in and out of the church of Saint Vincent, left their traces on the seats and desks, and in other ways disturbed the faithful. Saint Bernard, be it remembered, whilst preaching in the parish church of Foigny, was troubled by the incessant humming of the flies. The saint broke off his sermon to exclaim, "Oh, flies! I denounce you!" The pavement was instantaneously littered with their dead bodies.

Saint Patrick, as every one knows, drove the serpents out of Ireland by his ban.

This is the form of excommunication as given by Chasseneux:—"O snails, caterpillars, and other obscene creatures, which destroy the food of our neighbours, depart hence! Leave these cantons which you are devastating, and take refuge in those localities where you can injure no one. I. N. P.," &c.

Chasseneux obtained such credit from this opinion that, in 1510, he was appointed by the authorities of Autun to be advocate for the rats, and to plead their cause in a trial which was to ensue on account of the devastation they committed in eating the harvest over a large portion of Burgundy.

In his defence, Chasseneux showed that the rats had not received formal notice; and before proceeding with the case, he obtained a decision that all the parsons of the afflicted parishes should announce an adjournment, and summons the defendants to appear on a fixed day.

On the adjourned trial, he complained that the delay accorded his clients had been too short to allow of their appearing, in consequence of the roads being infested with cats. Chasseneux made an able defence, and finally obtained a second adjournment. We believe that no verdict was given.

In a formulary of exorcisms, believed to have been drawn up by S. Gratus, Bishop of Aosta in the ninth century, we find unclean beasts excommunicated as agents of Satan.

From such a superstition as this sprang the numerous legends of the Evil One having been exorcised into the form of a beast; as, for instance, by S. Taurin of Evreux (Bolland, Acta SS., 11 Aug., p. 640, col. 1); and by S. Walther of Scotland, who died in 1214, and who charmed the devil into the shapes of a black dog, pig, wolf, rat, &c. (Bolland, 3rd Aug., p. 264). The devil Rush, in the popular mediæval tale of "Fryer Rush," was conjured into a horse, and made to carry enough lead on his back to roof a church.

Felix Malleolus relates that William, Bishop of

Lausanne, pronounced sentence against the leeches which infected the Lake of Geneva and killed the fish, and that the said leeches retreated to a locality assigned them by the prelate. The same author relates at large the proceedings instituted against some mosquitoes in the 13th century in the Electorate of Mayence, when the judge, before whom they were cited, granted them, on account of the minuteness of their bodies and their extreme youth, a curator, and counsel who pleaded their cause, and obtained for them a piece of land to which they were banished.

On the 17th of August, 1487, snails were sentenced at Mâcon. In 1585, caterpillars suffered excommunication in Valence. In the 16th century, a Spanish bishop, from the summit of a rock, bade all rats and mice leave his diocess, and betake themselves to an island which he surrendered them. The vermin obeyed, swimming in vast numbers across the strait, to their appointed domain.

In 1694, during the witch persecutions at Salem, in New England, under the Quakers Increase and Cotton Mather, a dog was strangely afflicted, and was found guilty of having been ridden by a warlock. The dog was hanged. Another dog was accused of afflicting others, who fell into fits the moment it looked upon them; it was also put to death (T. Wright, Sorcery and Magic, vol. iii.). A Canadian bishop, in the same century, excommunicated the wood pigeons; the same expedient was had recourse to by a grand vicar of Pont-du-Château, in Auvergne, as late as the eighteenth century, against caterpillars.

The absurdity of these trials called forth several treatises during the middle ages. Phillip de Beaumanoir in the thirteenth century, in his "Customs of Beauvoisis," complained of their folly; and in 1606, Cardinal Duperron forbade any exorcism of animals, or the use of prayers in church for their extermination without licence.

A book published in 1459, "De Fascino," by a Spanish Benedictine monk, Leonard Vair, holds up the practice to ridicule. Eveillon, in his "Traité des Excommunications," published in 1651, does the same.

One curious story more, and we shall give a detailed account of one of these trials.

We have taken this from Benoit's "Histoire de l'Edit de Nantes" (tom. v., p. 754), and give it in the writer's own words. "The Protestant chapel at La Rochelle was condemned to be demolished in 1685. The *bell* had a fate sufficiently droll: it was *whipped*, as a punishment for having assisted heretics; it was then buried, and disinterred, in order to represent its new birth, in passing into the hands of Catholics. . . . It was catechised, and had to reply; it was compelled to recant, and promise never again to relapse into sin; it then made ample and honourable recompense. Lastly, it was reconciled, baptised, and given to the parish which bears the name of Saint Bartholomew. But the point of the story is, that when the governor, who had sold it to the parish, asked for payment, the answer made him was, that it had been Huguenot, that it had been *newly converted*, and that, consequently, it had a right to demand a delay of three years before paying its debts, according to the law, passed by the king for the benefit of those recently converted!"

We propose now giving the particulars of a remarkable action brought against some ants, towards the commencement of the eighteenth century, for violation of the rights of property. It is related by P. Manoel Bernardes in his "Nova Floresta" (Lisboa, 1728), and is quoted by M. Emile Agnel among his "Curiosités Judicaires et Historiques;" to whom and to the paper of M. Menabréa, entitled "Procés fait aux Animaux," in the twelfth volume of the Transactions of the Chambéry Society, we are indebted for much of our information.

"Action brought by the Friars Minor of the province of Pridade no Maranhao in Brazil, against the ants of the said territory."

"It happened, according to the account of a monk of the said order in that province, that the ants, which thereabouts are both numerous, large, and destructive, had, in order to enlarge the limits of their subterranean empire, undermined the cellars of the Brethren, burrowing beneath the foundations, and thus weakening the walls which daily threatened ruin. Over and above the said offence was another, they had burglariously entered the stores, and carried off the flour which was kept for the service of the community. Since the hostile multitudes were united and indefatigable night and day,

Parvula, nam exemplo est, magni formica laboris
Ore trahit quodcumque potest, atque addit acervo
Quem struit . . . (Horace, Sat. i.),

the monks were brought into peril of famine, and were driven to seek a remedy for this intolerable nuisance: and, since all the means to which they resorted were unavailing, the unanimity of the multitude being quite insurmountable, as a last resource, one of the friars, moved by a superior instinct (we can easily believe that), gave his advice that, returning to the spirit of humility and simplicity which had qualified their seraphic founder, who termed all creatures his brethren—brother Sun, brother Wolf, sister Swallow, &c.—they should bring an action against their sisters the Ants before the divine tribunal of Providence, and should name counsel for defendants and plaintiffs; also that the bishop should, in the name of supreme Justice, hear the case and give judgment.

The plan was approved of; and after all arrangements had been made, an indictment was presented by the counsel for the plaintiffs, and as it was contested by the counsel for the defendants, he produced his reasons, requiring protection for his clients. These latter lived on the alms which they received from the faithful, collecting offerings with much labour and personal inconvenience; whilst the ants, creatures whose morals and manner of life were clearly contrary to the Gospel precepts, and were regarded with horror, on that account, by S. Francis, the founder of the confraternity, lived by fraud; and not content with acts of larceny, proceeded to open violence and endeavours to ruin the house. Consequently they were bound to show reason, or in default, he concluded that they should all be put to death by

some pestilence, or drowned by an inundation; at all events, should be exterminated from the district.

The counsel for the little black folk, replying to these accusations, alleged with justice to his clients, in the first place: That, having received from their Maker the benefit of life, they were bound by a law of Nature to preserve it by means of those instincts implanted in them. *Item*, That in the observance of these means they served Providence, by setting men an example of those virtues enjoined on them, viz., prudence—a cardinal virtue—in that they (the ants) used forethought, preparing for an evil day: "Formicæ populus infirmus, qui præparat in messe cibum sibi" (Prov. xxx. 25.); diligence, also, in amassing in this life merits for a life to come, according to Jerome: "Formica dicitur strenuus quisque et providus operarius, qui presenti vita, velut in æstate, fructus justitiæ quos in æternum recipiet sibi, recondit" (S. Hieron., in Prov. vi.); thirdly charity, in aiding each other, when their burden was beyond their strength, according to Abbat Absalon: "Pacis et concordiæ vivum exemplum formica reliquit, quæ suum comparem, forte plus justo oneratum, naturali quadam charitate alleviat" (Absalon apud Picinellum, in Mundo symbolico, 8); lastly of religion and piety, in giving sepulture to the dead of their kind, as writes Pliny, "sepeliuntur inter se viventium solæ, præter hominem" (Plin., lib. xi. 36); an opinion borne also by the monk Malchus, who observes, "Hæ luctu celebri corpora defuncta deportabant" (S. Hieron., in Vita Malchi).

Item, That the toil these ants underwent far surpassed that of the plaintiffs, since their burdens were often larger than their bodies, and their courage greater than their strength.

Item, That in the eyes of the Creator men are regarded as "worms;" on account of their superior intelligence, perhaps superior to the defendants, but inferior to them morally, from having offended their Maker, by violating the laws of reason, though they observed those of nature. Wherefore they rendered themselves unworthy of being served or assisted by any creatures, since they (men) had committed greater crimes against heaven than had the clients of this learned counsel, in stealing their flour.

Item, That his clients were in possession of the spot in question before the appellants had established themselves there; consequently that the monks should be expelled from lands to which they had no other right than a seisure of them by main force.

Finally, he concluded that the plaintiffs ought to defend their house and meal by human means which they (the defendants) would not oppose; whilst they (the defendants) continued their manner of life, obeying the law imposed on their nature, and rejoicing in the freedom of the earth; for the earth belongs not to the plaintiffs but to the Creator: "Domini et terra et plenitudo ejus."

This answer was followed by replies and counter-replies, so that the counsel for the prosecution saw himself constrained to admit that the debate had very much altered his opinion of the criminality of the defendants. He had, the learned counsel for the defendants argued, admitted that the action was brought by brethren against sisters, brethren Monks against sister Ants. The sister Ants conform to the law of nature imposed on them, continued the counsel for the insects; the brother Monks, claiming to be ruled by an additional law, that of reason, violate it, so that they place themselves only under the law of animal instinct, the same which regulates the ants. The latter are not raised to the level of man, but the friars have lowered themselves to that of brutes. Consequently, the action is not between man and beast, but between beast and beast. All arguments founded on the assumption of higher intelligence in man consequently break down.

The judge revolved the matter carefully in his mind, and finally rendered judgment, that the Brethren should appoint a field in their neighbourhood, suitable for the habitation of the Ants, and that the latter should change their abode immediately, under pain of major excommunication. By such an arrangement both parties would be content and be reconciled; for the Ants must consider that the Monks had come into the land to sow there the seed of the Gospel, and that they themselves could easily obtain a livelihood elsewhere, and at less cost. This sentence having been given, one of the friars was appointed to convey it to the insects, which he did, reading it aloud at the openings of their burrows.

Wondrous event! "It nigrum campis agmen," one saw dense columns of the little creatures, in all haste, leaving their ant-hills, and betaking themselves direct to their appointed residence."

Manoel Bernardes adds, that this sentence was pronounced the 17th January, 1713, and that he saw and examined the papers referring to this transaction, in the monastery of Saint Anthony, where they were deposited.

We might conclude with a still more extraordinary trial, recorded in the Eyrbyggja Saga (Ed. Thorkelin, Havniæ, 1787), which took place in Iceland during the twelfth century, where a house had been haunted nightly by a band of ghosts, and the inmates instituted legal proceedings against them, somewhat in the manner above recorded; with this striking difference, that the ghosts attended the trial in person.

The story, however, is long, and an outline of it has appeared in the Icelandic travels of Captain Forbes, R.N. We have omitted the account accordingly, though with regret, as it is full of most singular details.

S. Baring-Gould, M.A.

COUNT DE ST. GERMAIN.

The last century was very fertile in adventurers, who cleverly took advantage of the struggle continually going on between superstition and scepticism to enrich themselves at the expense of their dupes. Such men as Cagliostro could only exist at a period when people still believed in the philosopher's stone, and hoped to restore their estates injured by frantic extravagance by the employment of the Great Secret. Among these

adventurers, one who made a great sensation in his day—and probably the best of the gang—was a person who began to be talked about in 1750, first under the name of the Marquis de Montferrat, then at Venice as the Count de Bellamare, at Pisa as the Chevalier Schœning, at Milan as Chevalier Welldone, at Genoa as Count Soltikoff, and at Paris as Count de St. Germain, which name he retained till the end of his life. His speciality was, that he gave himself out as a practical proof of the possibility of extending the limits of strength and life far beyond the ordinary compass, if not of attaining eternal youth and physical immortality. No one was ever able to discover his real origin, or the country where he was born, and even Frederick the Great speaks of him in his Memoirs as a man whose secret could never be discovered. When St. Germain alluded to his childhood, which he was fond of doing, he represented himself as surrounded by a numerous suite, enjoying a delicious climate on magnificent terraces, just as if he had been heir-presumptive to some king of Granada in the Moorish times. An old Baron de Stosch declared that he had known, during the regency, a Marquis de Montferrat, who passed as the natural son of the widow of Charles II., King of Spain, by a Madrid banker; others took St. Germain for a Portuguese Baron de Betmar; others, again, for a Spanish Jesuit of the name of Aymar; while, on the other hand, many declared that he was an Alsacian Jew, of the name of Wolf, or else the son of a customs-officer at San Germano in Savoy, called Rotondo. One day, when in a violent passion, the Duke de Choiseul declared that he was the son of a Portuguese Jew, which would coincide to a certain extent with the version of Baron de Stosch. He spoke English and German well, Italian admirably, French with a slight Piedmontese accent, and Spanish and Portuguese in perfection.

The Duke de Choiseul had a grievance against St. Germain, because he had served as the instrument in an intrigue which the King, or rather the Marshal de Belle-Isle, had formed without the cognisance of the Minister of Foreign Affairs. The Duke's favourite plan—which he regarded to some extent as the glory of his political career—was the reconciliation and intimate alliance he had succeeded in establishing between the Houses of France and Austria. Belle-Isle, the old adversary of Austria since the war of succession, eagerly combated the Minister's policy; but Louis XV. and the Pompadour were tired of the war, which did not progress as they wished. Choiseul also desired peace, but doubts were entertained whether he sought it as actively as the other party desired. St. Germain was among Belle-Isle's intimate friends, and often gave him remarkable advice. At this period he told the Marshal that he was on very friendly terms with Prince Louis of Brunswick, who was then at the Hague, and assured him that nothing would be easier than to open negotiations for peace by the intermediation of this prince. The king and the minister of war therefore sent St. Germain to the Hague; but Count d'Affry, the French envoy at that court, discovered the secret of this mission, and immediately sent off a courier to Choiseul, complaining bitterly that peace was being arranged under his very eyes by a perfect stranger. Choiseul sent back the same courier at once to d'Affry, with despatches enjoining him to demand most emphatically from the States General the extradition of St. Germain, who was to be sent in handcuffs to the Bastille. The following day Choiseul communicated d'Affry's despatch to the council, read the answer he had sent, and then, looking boldly at the king and Belle-Isle in turn, he said:

"If I did not await the king's orders in this matter, it resulted solely from my conviction that no one here would dare to treat for peace without the cognisance of your majesty's minister for foreign affairs."

The king looked down like a culprit, Belle-Isle did not say a word, and Choiseul's measures were approved. But, for all that, St. Germain was not put in the Bastille. The States General certainly displayed a readiness to consult the king's wishes in this matter, and at once sent a large body of troops to arrest St. Germain; but as, at the same time, they secretly warned him of what was taking place, he had time to escape and seek shelter in England. Thence he proceeded to St. Petersburg, where, we are told, he played a part in the revolution of 1762, though it is impossible to discover in what character. One thing is certain, that at a later date he became an intimate friend of the Orloffs. When he appeared at Leghorn, in 1770, with a Russian uniform and name, he was treated by Alexis Orloff with a degree of respect that haughty personage showed to few. And Gregory Orloff, who met him, in 1772, at Nuremberg, with the Margrave of Anspach, called him his *caro padre*, gave him, it was asserted, 20,000 Venetian sequins, and said of him to the Margrave, "That is a man who played a great part in one revolution." From St. Petersburg he proceeded to Berlin, and then travelled through Germany and Italy. He resided a long time at Schwabach and the court of the Margrave of Anspach, whom he accompanied to Italy. Eventually, he settled at Eckernförde, in the duchy of Schleswig, near the Landgrave Charles of Hesse, who was a great professor of the hermetic sciences, and consequently the prey of a multitude of charlatans. It was at the court of this prince that he died, wearied of life, in 1780. During the latter part of his life he was only attended on by women, who nursed and pampered him, and in their arms he heaved his last sigh, after watching his strength gradually expire. His papers passed into the hands of the Landgrave Charles, from whom no information could ever be drawn as to the enigmas St. Germain's life offered to his contemporaries, and who, besides, was not competent to appreciate the character of individuals of that class.

Altogether, it may be said of St. Germain, that he seems to have been one of the most inoffensive of the charlatans of the eighteenth century, and that his work had no other object than to allow him to enter the fashionable world and share in its pleasures: to lead a comfortable life at the expense of a few great lords, and amuse himself at the astonishment his eccentricities excited. For

this purpose, he profited very cleverly by the mystery that surrounded his birth, the possession of some chemical secrets, and the very rare advantage of retaining for many years that appearance of vigour which led to the belief that his exterior always remained the same; a fact which may possibly be explained by the employment of certain cosmetics, the secret of which his chymical researches had supplied. It is possible, moreover, that during his repeated journeys through Europe, this man, who was not restrained by any regard for social position, might have been employed in secret intrigues that constantly extended his sphere of action. He seems also never to have aimed at exercising lasting influence, and to have been exceedingly modest in his pretensions.

He was of middle height, and powerfully built; and, indeed, retained the most robust appearance for a long time. Ramon, envoy from France to Venice, asserted that he knew him in that city in 1710, as a man who appeared of about fifty years of age. In 1759, he was assumed to be sixty; and Morin, Secretary to the Danish Legation, who made his acquaintance in Holland in 1735, asserted five-and-twenty years later that he did not then appear a year older. In Schleswig, he retained to the last moment the appearance of a "well conserved" man of sixty. If all this be exact, he possessed either rare good fortune or great skill. Possibly, though, the Venetian St. Germain of 1710 was not the same; and, if this hypothesis is admitted, there would be nothing extraordinary in what we are told on this subject.

It is certain, however, that he sought to make persons believe that he had attained an extraordinary age; and he employed for this purpose various artifices, though he never made any positive assertions. Still, we must remark, in his defence, that he never went so far, as has been said, as to assert that he was a contemporary of Pontius Pilate, to whom he had rendered certain services, or boast of the efforts he had made at the Council of Nicea to promote the canonisation of St. Anne. These stories emanate from a mystification which was carried on far too long, and practised by a Parisian joker of the day, who possessed a peculiar talent for counterfeiting people, and who was eventually surnamed "My Lord Gower," because he mainly exercised his talent at the expense of newly-landed Englishmen. This individual was introduced to circles where St. Germain was unknown, and he was passed for the latter, and exaggerated his part, though he did not meet with less credulity on that account. Still, it is true that St. Germain credited himself with several centuries of life: if he were speaking with a weak-minded person, of events that occurred in the reign of Charles V., he would confide to him quite naturally that he was present at them; but if he had to do with a less credulous person, he contented himself with describing the slightest details with such vivacity and minuteness, and even the chairs and seats the actors occupied, that his hearer must fancy he was listening to a man who had really been witness of the facts he narrated.

At times, for instance, when alluding to a conversation with Francis I. or Henry VIII., he would feign absence of mind, and say, "The king then turned to me and said—," but immediately recollecting himself, he would recal the last words, and add, "and said to Duke so and so." He was thoroughly acquainted with anecdotic history, and in this way composed pictures and scenes drawn so naturally, that no eye-witness could have described in a more effective manner than himself events that happened in past ages. "Those humbugs of Parisians," he said one day to Baron Von Gleichen, "imagine that I am four hundred years old, and I confirm them in the idea, because I see that it affords them such pleasure. Still, for all that, I am many years older than I appear."

He possessed a great number of chemical receipts, especially for the composition of various cosmetics, and colouring matters, a very fine alloy of copper and zinc, and also for the manufacture of false precious stones, as it seems. He one day showed Baron Von Gleichen, in addition to a small collection of exquisite paintings, among which was a Holy Family by Murillo, a mass of diamonds so brilliant and large, that Gleichen fancied he gazed on the treasures of the Wonderful Lamp, and there was nothing to prove that the stones were false. But he no more asserted that he possessed the universal specific, than he did the Philosopher's Stone. He lived most temperately, never drinking at his meals; and the only medicine he took consisted of senna, prepared by himself. This was the sole advice he gave to his friends, when they consulted him on the art of living for a long while. It is true, though, that he spoke now and then with mysterious emphasis of the profundities of Nature, and opened up a large field for the imagination with reference to his learning and illustrious descent.

Differing from other charlatans, he never offered to sell governments the art of making gold; but, in accordance with the greatest lights of the age in which he lived, he pointed out to them the means of enriching themselves indirectly by the employment of all sorts of economical receipts, as well as great financial operations. While he thus had all the appearance of a man seeking to make a fortune, he was one day arrested in Piedmont on account of a note which was alleged to be false; but he produced more than 100,000 crowns in excellent securities, immediately paid the suspected note, and was so infuriated with the governor of the town, that the latter immediately had him set at liberty, with many humble apologies for the mistake that had been made.

He treated the Margrave of Anspach in the coolest possible way, like a young man who as yet knew nothing about superior things. To add to the consideration he enjoyed at that little court, he at times showed letters from Frederick the Great.

"Do you know that handwriting?" he said one day to the Margrave, showing him a letter still in its cover.

"Yes, it is the king's private seal."

"Well, you shall not know what is inside," and he coolly returned the letter to his pocket.

Such are all the facts I am enabled to collect with reference to Count St. Germain, who greatly excited public curiosity in his day. Possibly he

was a rogue. I am not at all prepared to deny it; but at any rate he did not prey on public credulity to the extent of other men of his stamp. I have collected this memoir of him, merely to show by what clumsy artifices our ancestors could be gulled.

Lascelles Wraxall.

OUR SECRET DRAWER.

There is a secret drawer in every heart,
 Wherein we lay our treasures one by one;
Each dear remembrance of the buried past;
 Each cherished relic of the time that's gone;

The old delights of childhood long ago;
 The things we loved, because we knew them best;
The first discovered primrose in our path;
 The cuckoo's earliest note; the robin's nest;

The merry hay-makings around our home;
 Our rambles in the summer woods and lanes;
The story told beside the winter fire,
 While the wind moaned across the window panes;

The golden dreams we dreamt in after years;
 Those magic visions of our young romance;
The sunny nooks, the fountains and the flowers,
 Gilding the fairy landscape of our trance;

The link which bound us later still to one
 Who fills a corner in our life to-day,
Without whose love we dare not dream how dark
 The rest would seem, if it were gone away;

The song that thrill'd our souls with very joy;
 The gentle word that unexpected came;
The gift we prized, because the thought was kind;
 The thousand, thousand things that have no name.

All these in some far hidden corner lie,
 Within the mystery of that secret drawer,
Whose magic springs, though stranger hands may touch,
 Yet none may gaze upon its guarded store.

Isabella Law.

HOW I INVESTED MY LEGACY IN THE PURCHASE OF LEASEHOLD PROPERTY, AND WHAT CAME OF IT.

"Look here, John!" cried my wife one evening, as we were reading the "Times"—I absorbed in the debates, and she conning the supplement. "Here's a chance of investing our money," and she read as follows.

£500. Any person possessing this capital can obtain $27\frac{3}{4}$ per cent. by the purchase of first-class long Leasehold Property, at low ground-rents, let to tenants of the highest respectability. Apply to Mr. Jollybold, on the premises, Arethusa

Villas, Arethusa Park. Omnibuses to the Bank, 4d. No Agents need apply.

"Why, John," added she, "that makes nearly 140*l*. a year. Only think of that!"

"Nonsense, my dear," I returned. "You must have made a mistake. The advertisement means 27*l*. odd as the income, and that is rather more than five per cent."

"It does not say 27*l*. annual income, I tell you," she returned; "but 27¾ per cent."

I read the advertisement myself. There it was clear enough. Twenty-seven and three-quarters per cent. on an investment of 500*l*.

"Ah!" I replied, "some tumble-down cottages, I dare say."

"But it says let to tenants of the highest respectability."

"Well," I rejoined, "I should consider those who paid their rent, tenants of the very highest respectability, to whatever station of life they may belong."

"Nonsense, John," said my wife. "Artisans don't want omnibuses to the Bank at fourpence."

Upon second consideration I acknowledged she was right. Artisans do not usually take fourpenny rides every morning.

"There seems a genuineness about it, too," she added. "No agents need apply. At any rate, it is worth looking after. It's time we did something with the money."

The money here alluded to was 500*l*., which I had received under the will of a deceased aunt, and of course it was necessary that we should invest it in the most advantageous manner. I was doing tolerably well in the cheesemongery line, and was paying my way, which is something in these hard times. I did not want the capital in my business, and we were consequently upon the look out how to make the most of it. My wife had examined the "Times" supplement every evening for a couple of months, and we had answered several advertisements, but nothing seemed likely to suit.

"What do you say, John?" continued she. "Shall we go and look at the property?"

I agreed to this proposition, and on the morrow we visited Arethusa Park. We had some little difficulty in finding Mr. Jollybold, described in the advertisement as "on the premises." As Arethusa Park contained some fifty or sixty houses, we didn't know which house to apply to, and after making various inquiries without effect, I looked in at the Freeholders' Arms, a large flaring public house in the vicinity, and by a curious coincidence Mr. Jollybold was there in the parlour. He was a huge fellow with a very red face, and husky voice.

"I have called, Mr. Jollybold," I said, "in answer to your advertisement."

"Just so," replied Mr. Jollybold.

"Would you be kind enough to show me and my wife the property?" I said. "She is waiting outside."

"With pleasure," returned Mr. Jollybold, tossing off the remains of a glass of brandy and water.

"Would you be kind enough," I began, as we walked down the park towards Arethusa Villas, "to explain to us how so large a per-centage as 27¾ per cent. is to be made? Is it quite genuine, or is it a trick in the advertisement? We know that people advertise all sorts of things now-a-days, so that we hardly know how to give credit to honest representations."

"Perhaps you don't know much about house property?" said Mr. Jollybold.

"No," I said. "The fact is, I have never yet dabbled in bricks and mortar, but having had a legacy left me of about the sum you mention, I thought I might possibly—if all things suited—try the nature of the investment."

"Just so!" replied Mr. Jollybold. "And you'll find it a speculation unequalled at the present day. I only wish I had more money to put in it, and I'd very soon make my fortune."

"I should think you would," said my wife, "if near 30 per cent. is made of money."

"Thirty per cent!" cried Mr. Jollybold, "not 30 but 300! Why, look here," he said, pointing to some houses on an adjoining estate. "The man who took that land had the whole five acres for 100*l*. a-year, and relet it at 600*l*. a-year. He sold his improved rents for near upon 12,000*l*. Can California or Australia beat that?"

"Well, no," I said, "I should think not. But is there anything, Mr. Jollybold, to be done in a similar way with the property we are come to look at?"

"To be open and candid," replied Mr. Jollybold, "I don't think there is. You might, perhaps, put a couple or three pound on the ground-rent of each house if you wanted to sell, but as you'll do pretty well as it is, I should advise you to keep 'em. This is the property," said he, stopping before four large semi-detached houses, with long flights of steps, porticoes, and fine cornices and balustrades at the top.

"Why, you don't mean to say these four houses are to be sold for 500*l*.!" I exclaimed with astonishment.

"I do," returned Mr. Jollybold, "and no nonsense about it either."

"But I certainly cannot understand you. Why these houses let, I should think, for 50*l*. or 60*l*. a-year!"

"65*l*. a piece—260*l*. a year for the lot," said Mr. Jollybold.

"Then there's ground-rent," I said, "to be deducted."

"That's 10*l*. a house," he replied, "and a very low rent too for such houses."

"But I don't yet quite understand, Mr. Jolly bold, how you make out with an outlay of 500*l*. I am to get 27¾ per cent.?"

"Perhaps not. Not being acquainted with the ins and outs of house property, you don't very likely understand what the 'equity of redemption' means?"

"Equity of redemption," I said, "no, I don't."

"Well that's what I've got to sell," returned Mr. Jollybold. "You don't expect to buy the land when you get a lease, do you? but you have the use of the land all the time you pay the ground-rent, don't you?"

"Yes," I said, "until the lease is out."

"Just so," returned Mr. Jollybold; "and when

you mortgage a house you have the use of it just the same all the time you pay the interest, don't you?"

"Of course. But are these houses mortgaged, Mr. Jollybold?"

He seemed to consider this a good joke, and he could not help indulging in a gruff laugh. "Is anybody stupid enough," he rejoined, "to build houses without hiring money? and how do you think I could sell you these to pay 27¾ per cent. if they wasn't mortgaged? And—"

I stopped him here, and said, "As that is the case, Mr. Jollybold, I would rather have nothing to do with the property, and so I wish you good afternoon."

"You must excuse me," he said, "for laughing at your observation, but as you are not up to the nature of building transactions, you of course require an answer to your question, how I can sell you these houses to pay 27¾ per cent.? Well, it is just here. They are let at 65*l.* a piece; this makes 260*l.* a-year for the whole. Now, deduct 40*l.* for ground rent, and 7*l.* for insurance, and that leaves 213*l.* Then they are mortgaged for 1500*l.* at 5 per cent., and this gives another deduction of 75*l.*, and leaves a yearly gain of 138*l.*, and this I am willing to sell for 500*l.*"

I made the calculation on a piece of paper. There was no mistake about it; 138*l.* per annum for 500*l.* gives 27¾ per cent.

"And your interest in these houses, over and above the mortgage, is your equity of redemption, Mr. Jollybold?"

"Just so!" said he; "and now, having made these calculations, I should think you could see the advantage of using other people's money as well as your own."

"But in case the money is called in?" I suggested.

"There's always plenty of people to let you have money on mortgage," he said; "and there's only the expense of shifting from one to the other, which is very trifling."

"Then there's repairs," I said.

"Repairs to these houses!" he replied. "Why they haven't been built twelve months yet, and are let to first-class people. Bless you! them houses will be better when the tenants leave 'em than when they went in. Repairs! Why tenants of this sort don't send to you when a nail wants driving, or a window clatters. They're above it. Now there's Mr. Coffers, head clerk at a Lombard Street bank, lives in No. 1, and I should say if he's laid out a penny on that house since he's been in it he has spent 50*l.* in fittings. And this tenant at No. 2 is a merchant in a large way of business in the city, and *he* aint likely to be bothering you every day. I *have* had tenants in 20*l.* a-year houses as did dip into your pockets, but when you have property like this there's no mistake about it. Just look in and see one of them. They're all alike. Let's go into Mr. Coffers'."

Mr. Jollybold, having received permission of the servant, ushered us into the double drawing-room of Mr. C., elegantly furnished, and abounding in mirrors and nick-nacks. My wife and I looked more at these than at the rooms, but Mr. Jollybold requested us to notice the splendid marble mantelpieces, the enriched cornices, the china finger-plates, and the plate-glass windows. I confess I had an itching to become possessed of such desirable property, on such apparently easy terms: and my wife, I am sure, had similar feelings. How it would magnify the legacy in the estimation of our neighbours! As Mrs. Coffers was upstairs, we did not see the upper floors, but contented ourselves with looking into the back garden, through the drawing-room window. It was tastefully arranged, and sparkled with geraniums, calceolarias, and various other flowers.

"Well, now, what do you think of it?" said Mr. Jollybold, as we came down the steps. "Did you ever see better finished houses? Don't they do credit to a man's taste? And if you had seen the kitchen floor you would have said, 'Jollybold does know how to arrange houses.' Talk about convenience!—there," said he, "I'll defy any man to plan more convenient houses than them."

"And are they well built, Mr. Jollybold?"

"They're built too well, sir. Leasehold houses ought to be built to last only one day longer than the lease, and then they ought to tumble about the freeholder's ears. But as for these houses, they'll last three times 99 years, and when the leases are out, they'll be rather better than they are now, for then they will be thoroughly seasoned."

"What do you say, my dear?" I said to my wife; "shall we entertain the offer?"

"I think, if Mr. Jollybold would say 450*l.*," she replied (she has a shrewd way of business, has my wife) "we might do so."

"Now, that is tolerably good, ma'am," said Mr. Jollybold; "you must excuse me for saying so, but you came here doubting if my representations were correct, and now you find everything honest and straightforward, you want to beat me down in price. I mean business, sir," he said to me, "and I don't abate one penny—and if you don't take the houses, I have a customer who will; indeed, he had only left the Freeholders' Arms five minutes before you came in."

"And you didn't close the bargain?" I said.

"No, sir. He wanted the purchase to stand over for a couple of months, and offered an extra 50*l.* if I would agree to it, but I said 'No, if I have a customer he must be a ready-money man.' So, sir, if you are prepared with the money, there's the houses."

"I have the money," I replied, "and could pay for them to-morrow."

"Oh, yes!" continued my wife. "Our stockbroker could sell out at an hour's notice."

"Just so!" said Mr. Jollybold; "and the sooner you have the property, the sooner you will get 30 per cent. instead of 3 for your money."

The thought struck me if Mr. Jollybold was making 30 per cent., why did he want to sell such desirable property, and I asked him what had induced him to put the houses in the market.

"It is just this," he said. "I'm building at other places, and I must cover some of the land by a certain time, or forfeit my agreement; I therefore want the money at once—not from poverty, but for keeping the ball moving."

Although I did not understand much about building matters, I knew that builders were speculating men, and speculating men of necessity require money. I consequently accepted Mr. Jollybold's explanation; but in order to be cautious, I said "I don't doubt your veracity, Mr. Jollybold, but as we are strangers, I should like to have some corroboration of the particulars as to lease, term, and so on."

"Do you know Driver and Tartar of Boswell Court?"

"How strange!" I exclaimed. "My aunt's solicitors!"

"Then you are prepared to credit them?" said Mr. Jollybold. "They are the identical men that prepared these conditions."

And he took from his pocket the particulars and conditions of sale of Arethusa Villas.

"Oh! then," I said, "you have offered the property by auction? How was it it did not sell? Your auctioneers are men of celebrity."

"They have too much business," said Mr. Jollybold. "They sent a clerk down to look at the property. He made himself jolly at my expense at the Freeholders' Arms, and at the time of sale the auctioneer himself didn't know if Arethusa Park was at Highgate or Brixton, and so I lost the sale."

"Might that be the reason why you put 'No agent need apply' in your advertisement?"

"One reason. But I like old Ben Franklin's maxim—'If you want a thing done, do it yourself,'—and I know you quite agree with me in this, or you would have sent an agent to negociate for you; instead of which, like a wise man, you make every inquiry yourself and sift things to the bottom, and then have the satisfaction of knowing that you are dealing with an honest man who has nothing to conceal."

"I confess candidly," I said, "I am quite a novice in these matters; but every man can make common-sense inquiries and judge for himself."

"Just so!" replied Mr. Jollybold, "and any man of common sense can understand what is meant by this rigmarole of conditions of sale, although filled with lawyer's lingo. Here's the condition for limiting title" (pointing out the clauses to me), "and here's the clause that the property is sold subject to the mortgage, as I told you. You also notice that what I said of the ground-rent and so on is correct. And so we may as well adjourn to the Freeholders' Arms and sign the contract."

"I should like some consideration before doing so," I said. "I feel disposed to purchase the houses, but if you will allow me, I will take these conditions home with me to look over, and if I think there is nothing objectionable, I doubt not we shall come to terms."

"Appoint your own time," said Mr. Jollybold, "but let it be early, as I have a good deal of business to transact."

"The day after to-morrow?"

"I am afraid," said Mr. Jollybold, "I couldn't say that day. Say to-morrow, at your own house. Perhaps you'd give me your address?"

"John Fingudgeon, Cheesemonger, Little Turnwheel Street."

"To-morrow, ten o'clock," said Mr. Jollybold, "and I'll call upon you."

We shook hands and parted.

"Don't you think it will be a capital speculation?" said my wife. "And only think how we shall rise in the estimation of our neighbours. I have heard from two or three quarters that people fancy that the legacy was 2000*l.* at least, and won't they believe it when they hear we have bought four such large houses? How uncommonly fortunate I noticed the advertisement!"

"I hope it will be all right," I said; "but I should like somebody's opinion about this rigmarole of conditions, which I don't understand."

"Oh, nonsense, John!" returned my wife. "Why you know that hundreds of houses are sold by auction to people who have never even seen them before, and they are all sold under conditions; besides, Driver and Tartar, your aunt's solicitors, wouldn't put in anything but what was quite right and proper, so you needn't fear anything."

I saw plainly enough she was looking forward to the important addition to our income of 138*l.* per annum.

We had scarcely discussed matters thus far when Mr. Jollybold presented himself.

"I quite forgot," said he, "when you left me, that I had business to transact to-morrow that would prevent my calling upon you, and as a few hours can make no difference, you may as well pay me a deposit of 50*l.*, and settle the matter at once."

"I would much rather put it off till to-morrow," I said; "and, in fact, I have not 50*l.* in the house."

"It don't matter, 25*l.* will do," said Mr. Jollybold; "just to bind the bargain."

I hesitated, and advanced various objections, which Mr. Jollybold very readily answered, and in half-an-hour I had signed the conditions to purchase the equity of redemption of Nos. 1 to 4, Arethusa Villas, for 500*l.* My wife and I retired to rest perfectly satisfied with our day's work.

The next morning I called on Messrs. Driver and Tartar, in Boswell Court, informed them of my purchase, and asked their opinion of the speculation.

"We don't know anything except from representation," said Mr. Driver; "but, as the percentage is large, we should say decidedly it is a good speculation."

"But is there anything you know of likely to detract from it?" I asked.

"No. For leasehold property, I should say it was good, and you need not trouble yourself about the money being called in. The mortgagee is a wealthy man, and don't trouble himself all the time the interest is punctually paid."

I left Mr. Driver doubly satisfied with my speculation. In due time the necessary assignment was prepared, and I entered upon the property. Having to pay 45*l.* for legal expenses I confess rather astonished me, and, to tell the truth, rather inconvenienced me in my business. I thought the amount large, and told Driver so. (We had agreed that he should act for both parties to save the expense, and he had estimated the

cost to me at first at 15*l.* to 20*l.*) He assured me "that various unexpected matters had turned up, which had taken a good deal of trouble to arrange," but that now I was perfectly safe, and had nothing to do but to receive the proceeds of the property. I consoled myself with the thought that 45*l.* would soon be met by the rents coming in, and in another three months I should more than make it up.

Legal matters having been settled, I went to introduce myself to the tenants. Mr. Coffers, No. 1, was not at home. Mrs. C. received me somewhat distantly, but congratulated herself on having a fresh landlord, "for Mr. Jollybold," she said, "was a low, ignorant fellow, and any change would doubtless be a change for the better." No. 2 was also not at home, but Mrs. Crantin no sooner became acquainted with the purport of my visit than she requested me to look down into the kitchen and see if I could apply some remedy to prevent the chimney from smoking, which was at present intolerable. Cook would also show me where the pipe was stopped that had caused the back area to become flooded, which was in such a state that Mr. Crantin had threatened to call in the inspector of nuisances and compel Mr. Jollybold to remedy it; but I as the new landlord would do it as a matter of course for the sake of the property. I promised to get it done.

No. 3 *was* at home. His name was Dunderly. He was an elderly gentleman attached to scientific pursuits, and appeared in a dressing-gown and slippers, although it was five o'clock in the afternoon. The other portions of his attire were decidedly seedy, his hair was unkempt, and his beard of a fortnight's growth.

"And so you have bought the property, Mr. Fingudgeon, eh?" said Mr. Dunderly: "and I hope, as you are no doubt a capitalist, you will do what I have been asking that lubber, Jollybold, to do ever since I took the place—to build me a laboratory at the back of the house. The fact is, I am damaging the property against my will, in carrying out my scientific experiments. Just look here," and he opened the folding-doors between the front and back drawing-rooms. "Notice the ceiling."

I looked up and saw a part of the plastering had fallen, showing the bare laths, and the whole ceiling was quite black.

"I can't help such accidents occasionally," he said, "when trying experiments with new gases. One of my retorts burst by the explosion of a new gas I was experimenting upon, and you see the effect. Now, if you were to build me a laboratory which would stand these effects, I should not be necessitated to conduct my experiments in this room."

I thought I would be candid with him at once, so I told him I could not allow my house to be used in such a manner, and should expect him to put it into repair, and desist from carrying out his experiments there in future.

"My dear Flintgibbon—"

"Fingudgeon," I suggested.

"Fingudgeon, I stand corrected. My dear Fingudgeon, don't you know I have a clause in the agreement with Jollybold that I may use this room until the laboratory is erected—you don't know it?"

"No," I said.

"Just like Jollybold. I thought he would take somebody in with these houses. But he's a shrewd fellow after all. I tell you what it is, Findragon, I was kicked about from pillar to post for half a dozen years until I met with this house. There wasn't a landlord who would let me one, as my propensities are so well known, until Jollybold let me this. 'I don't care,' said he, 'how you use the house, only do me the kindness to keep the laboratory door shut, in case any one comes to look at the house, and I'll give you a compliment when I catch a flat to buy 'em.' And so he has caught you, Pinbutton, has he?" said Mr. Dunderly.

I felt irritated at his calling me so constantly out of my name, and with his impudent manner. I told him I would see my solicitor as to the way in which he was using the house, and he might very soon find himself troubled with law proceedings. His conduct I considered disgraceful.

"My dear Grimgibbon, don't be so foolish," he said. "Out of nothing, nothing can come. It's no use going to law with a penniless fellow, and I shall always be penniless while I carry on these experiments, and I shall carry them on until I die. Probably blow myself to atoms, and some day, not unlikely, you will find the greater portion of my remains sticking to the laboratory rafters. But whatever you do, my dear Primbudgeon, don't go to law."

I left Tenant No. 3 in a pet, and was really glad that when I knocked at No. 4 the door was not answered.

When I got home my wife thus accosted me:

"John, I have been making a calculation of the profits we shall get out of our new houses, and I am going to keep an account of what they cost, and how much they bring in. See! I have put down on one side—

Purchase £500
Law Expenses . . . £45

and we shall soon have the quarter's rent come in, which I shall put down on the other side. But how do you like the tenants?"

"No. 1, as you know," I said, "is highly respectable. No. 2 seems pretty good, but wants some repairs."

"Not so soon, surely? Why Mr. Jollybold said there would be nothing wanted for a long time to come."

"It seems the kitchen chimney smokes, and I suppose the landlord has to attend to that."

"And No. 3 tenant?" asked my wife.

"He's a curious fellow, very fond of experimenting on gases, and so on." I was ashamed to tell her of the reception I had met with.

"And No. 4?"

"The tenant was not at home."

I sent a jobbing bricklayer to No. 2, who ran me up a long bill. He was a great chimney doctor, and he declared the lady was delighted, as he had made it draw 'first-rate, like a furnace.' I could not help thinking I was being drawn myself as I told my wife to put down 6*l.* 13*s.* 2*d.* on the same side of the account.

The purchase was settled about a month before the quarter, and I was rather glad that the quarter came round so early, as I began to be in want of money. I waited for a fortnight, and then wrote a polite note to each of the tenants that I would call on a certain day for the rent. I did so, with the following result:

No. 1 was prepared with the money *minus* a deduction of 1*l*. 8*s*. 6*d*., nine months' sewers rate; 2*l*. 4*s*. 3*d*., nine months' property tax; and 18*s*. 6*d*. land tax. "And then there's this little bill of 2*l*. 18*s*. 9*d*. for repairing the cistern, whitewashing the ceiling, and part papering the staircase, where the wall was damaged by the water," said Mrs. Coffers, "making a total deduction, according to Mr. Coffers' account, of just 7*l*. 10*s*.; and here is Mr. Coffers' cheque for the remainder."

"You must excuse me, madam," I said; "but I have only had the houses a month, and you have brought me in bills of nine months' taxes, and the repair of cistern."

"Oh!" she said, "that is a matter that required immediate attention, and you could not expect us to send all the way to Little Turnwheel Street for a plumber." The allusion to my address she accompanied with an evident sneer.

"I should like to consult Mr. Coffers," I replied, "before I give you a receipt."

"It's no use your calling at the Bank," she said. "He cannot attend to you there, and he does not like to be disturbed when he comes home to dinner. The taxes you are charged with have to be allowed to the tenant in the rent, and you must apply to Mr. Jollybold if he did not allow you the deduction when you purchased the houses. Mr. Coffers, thinking probably you might be ignorant of these matters (another sneer at Little Turnwheel Street), requested me to give you this information; and he has left a receipt, drawn in a proper manner, which you will be kind enough to sign."

After a little demur I did so, and left with a cheque for 8*l*. 15*s*. instead of 16*l*. 5*s*.

Mr. Crantin, No. 2, was not at home, and Mrs. Crantin knew nothing about business matters. I must call at Mr. Crantin's offices in Polyblank Court.

I had not much hope of Mr. Dunderly.

"Ah! Flintbudden," he said, "how are you? Brought a builder to set out my laboratory? Upon my word you are a genuine fellow. I am glad to have such a man for a landlord. I don't regret that Jollybold met with such a customer for his houses."

"I don't congratulate myself on having such a tenant as you are, Mr. Dunderly—so I tell you plainly. You know very well I don't intend to build your laboratory, and it is only press of business that has prevented me from troubling you with law proceedings for wilful damage to my house."

"Well, I can assure you, Pindudgeon—"

"I must beg of you to call me by my proper name," I said, snappishly. "My name is Fingudgeon, and you have called me a dozen other names at least."

"I beg your pardon, Fingudgeon, but that is such an outrageous combination that our chemical couplings are as nothing to it. Let me see, what were we talking about?"

"The object of my visit," I said, "you know from my letter."

"What letter? I have been so much engaged lately in carrying out a series of valuable experiments which are destined to confer such immense benefits to mankind at large, that I have overlooked matters relating to one's self. And so you wrote to me, did you? And as you are here, perhaps you will be good enough to tell me what was the purport of the letter, to save me the trouble of looking for it."

"Plainly, then, Mr. Dunderly, I have called for the quarter's rent, which I apprised you, by letter, was due a fortnight ago."

"No wonder then," he replied, as coolly as possible—"no wonder I didn't pay any attention to it. Do you know I never pay any attention to mere applications for money by a private individual. In fact to me they are a matter of rejoicing, and I pass them over to my wife with the remark, 'Luck again, my dear. Jones, or Brown, or Smith, or Green—as the case may be—will wait another month before they take proceedings;' and, I assure you, I let 'em wait," said Mr. Dunderly, with a chuckle.

"But rent is an obligation that cannot be passed over so lightly," I said.

"Quite right, Pillgudgeon," he replied; "and the more cautious a man ought to be, when he pays his rent, to know that he is paying it to the right party."

"You don't doubt my authority to collect my own rents, do you, Mr. Dunderly?"

"I have no doubt," he said, "that you are an honourable man, Mr. Flintgudgeon—there, I am right in your name for once—and that your address is Little Turnwheel Street, but in what direction that locality may be I know no more than Jupiter; but as for any legal proof that you have purchased this house of Mr. Jollybold, you have given me none. I have no doubt that Jollybold has sold his interest in it, but it does not of necessity follow that you are the purchaser, or that you have any more right to demand the rent than any lawyer's clerk out of luck who might call in on speculation. I should not pay him of course, but as you are in reality as much a stranger to me as any lawyer's clerk (and I assure you a much greater stranger than some), I must request you to give me some more definite evidence of being Mr. Jollybold's successor than you have yet done, Mr. Filgudgeon."

"I'll go and fetch Mr. Jollybold, who will at once convince you. We will settle that in ten minutes, Mr. Dunderly."

"Will you?" he returned. "Then I expect you'll take an aerial flight, and a pretty quick one, Mr. Findudgeon."

"What do you mean?" I said. "Mr. Jollybold wrote to me, only a week back, that he would call on me in a few days in answer to a letter I had written him."

"You don't know Jollybold has emigrated then?" he replied; "why he's halfway to the

Polynesian Islands by this time. He's been gone a month."

"You surprise me!" I cried; "Jollybold emigrated?"

"Yes, Mr. Flintgudgeon. Jollybold has emigrated to one of the Polynesian Islands, and I have no doubt, by his shrewdness and perseverance, he will open up the country, provided the natives don't eat him first; but I don't think they will do that, as he would be rather gross eating."

"But I received a letter from him only last week."

"From Gibraltar, or some other port?"

"No, from the post-office, round the corner."

"Another proof of Jollybold's shrewdness," said Mr. Dunderly, "but carried a little too far. He needn't have deceived you, Flintdudgeon, after he had pocketed your money. He might have told his amanuensis that you were an exception."

"However," I said, "that does not alter the matter. You are living in the house and must pay the rent; and if you don't do so, I shall take legal proceedings."

"A man occupying a house, undoubtedly implies an obligation to pay rent," replied Mr. Dunderly; "but you must recollect I have not yet attorned to you as my landlord."

"Attorned?" I said, "I don't understand you."

"Don't you?" he returned; "then there's a nut for you to crack. But whatever you do, Flintgibbon, don't go to law!"

"Much as I detest law," I exclaimed, "I don't intend you shall get the better of me, and so you shall see, Mr. Dunderly;" and I left him in a worse pet than on the previous occasion.

On ringing at No. 4, I was greeted by a baker-boy in the following manner:

"No go, my man," said the boy. "You needn't lose your time chiming there. They've stepped it."

"Stepped it!" I exclaimed, "do you mean to say that Mr. Kankerdale has left?"

"Rather!" replied the boy, "and you're jolly lucky if they don't owe you anything."

I made inquiries at a neighbouring grocer's shop, and was informed that Mr. Kankerdale had always been looked upon as doubtful pay; that he had run in debt right and left, until proceedings were taken against him. He had then disposed of his furniture under a bill of sale, and had finally decamped with the key. "And lucky it was for Jollybold," said the grocer, "that he hooked the Turnwheel cheesemonger before he emigrated."

I was ashamed to confess that I was the individual alluded to, and at once returned home without making further inquiries with a cheque for 8*l.* 15*s.* in my pocket instead of 65*l.* less property tax, as I had anticipated. On my entrance, I found a note awaiting me being an application for a quarter's ground-rent.

"Well," said my wife, "that's only 10*l.* and not much to pay out of 65*l.*"

"I wish I had 65*l.* to pay it out of," I said, "but unfortunately I have not taken enough to pay even this small demand." I was some time before I could bring my wife to understand the precise state of affairs

"I'd go and consult Driver at once," she said. "I would not be dictated to by tenants. I'd show they had a landlord to bring them to book."

I thought I had better call on Mr. Crantin, the tenant of No. 2, at his offices in Polyblank Court. After waiting for an hour and a half in a musty office, in the company of a small boy, perched on a high stool, Mr. Crantin came in. I asked him civilly for the rent, and he opened his cheque-book and commenced filling up a cheque.

"By-the-bye," he said, "there's a deduction this quarter of 5*l.* as per agreement."

"What for?" I asked.

"Why, haven't you your agreement? I'll show you mine."

He soon found it, and by it I saw Mr. Jollybold had agreed to return 5*l.* a year.

"It's usual," he said, "with these builders, to keep the rents up, and return you a portion afterwards. It makes the houses sell better."

"Then," I replied, "you only really pay 60*l.* a year?"

"Exactly. Then, I think there are a few deductions for rates and taxes. So you had better call again, as I haven't got the papers with me; and when you do so, bring me a note from Jollybold, to say that he has transferred his interest to you, will you? Good morning."

Feeling rather tender upon the point of 45*l.* for law expenses, I resolved to consult a neighbouring broker on the best way of proceeding against Mr. Dunderly and Mr. Kankerdale. I knew Grinder as a shrewd fellow who had had considerable experience in distraints, and he, at any rate, would not charge me six and eightpence every time I consulted him.

"I'll tell you what it is," said Grinder. "I know what *I* should do with Master Dunderly. I'd put a man in. That'll bring him to his senses."

"But he told me, Grinder, that he had not attorned to me as landlord. What does that mean?"

"It means that he has not paid you any rent, or in any other way acknowledged you as his landlord, that's what the lawyers would tell you; but Lor' bless you!" said Grinder, "when you once put a man in he'll be sure to look about him. If he's rusty at fust he'll cool down before the five days is out, and stump up the ready."

"And suppose he don't pay in the five days?"

"Why then we condemns and sells his traps," said Grinder.

"But suppose, Grinder," I said, "he brings an action?"

"Let him," said Grinder. "I'll guarantee you against all law-suits."

Inasmuch as Mr. Grinder was not worth ten pounds, his guarantee was not very valuable; but as he was an experienced man, I determined to sign a warrant to distrain on Mr. Dunderly's goods, and leave Grinder to fight it out.

"And now, as to Kankerdale's house?" I inquired. "How can I get possession of that?"

"Leave that to me as well," said Grinder. "I'm up to a move or two. I'll get a man to slip in the back way. He will open the front door. I, as your agent, will (quite by accident) be passing

that way, and will go in and take possession. And there you are!"

"Capital thought, Grinder," I replied; "I am glad I spoke to you."

"Well, I haven't been in the business five-and-thirty year," said Grinder, "without knowing something of the dodges to be played."

The next evening Grinder called. "How have you got on with Dunderly?" I said.

"In all right," replied Grinder; "although I thought the old blade would be too chary for me. He kept me dodging about till late in the afternoon, but I managed it at last. Uncommon short of furniture though. The front parlour may fetch eight or ten pound, the rest aint worth above four or five more. I aint surprised a bit. People who come it tidy in the parlour is very often short otherways. I shall send the old man I put in a shake down, for there aint anything to sleep him at present."

"And did he object to the proceedings?"

"He was tolerably cheeky," said Grinder; "especially when I put his old bottles and jars down in the Inventory. He declared I was making an excessive levy,—that they was worth 40*l.* or 50*l.*, and a good deal more rubbish of the same sort. But Lor! such coves always is fussy. 'I'm an old blade,' I says, 'at this work, and you don't frighten me.'"

"And what do you think he'll do, Grinder?"

"Pay the rent and expenses," said Grinder, "if he's any respect for his old bottles and jars. That's what he'll do."

"And how about No. 4?"

"Not quite so satisfactory. In course I took your word for it, that there was nobody in the house, so I gets a man to go round to the back, and as luck would have it, he finds a window-sash undone. He pops in, and was going up the stairs to open the front door, when he meets a one-eyed old customer lame with one leg, and deaf as a post. 'What do you want here?' says One Eye. 'I'm come from the landlord,' says Joe. 'Can't hear you,' says One Eye—'write it down on a bit of paper,' which Joe did. 'Now, put down the address,' says One Eye, and Joe, thinking he might be took up for housebreaking, did that too. 'Very well,' says One Eye, 'that will do, you can go out of the front door if you like,' and so far the old man behaved very civil. "So I suppose," said Grinder, "you'll have to wait a little longer there. But it was an uncommon good job old One Eye was so civil."

I thought I had better be prompt with my ground-rent, so I called upon Mr. Marker, my ground landlord, on the following day, to pay the quarter due. He was an octogenarian, with a black scull cap on. He was seated at a writing-table, apparently making up his accounts.

"And what do you want?" said Mr. Marker, as soon as I had been ushered into his presence by a slip-shod girl.

"I've called to pay some ground-rent for Arethusa Villas," I replied.

"Oh! I beg your pardon. Sit down. Sit down, Mr. ——"

"Fingudgeon," I said.

"Sit down, Mr. Fingudgeon," continued Mr. Marker; "I'm sorry I didn't recognise you."

This was not to be wondered at, as he had never to my knowledge seen me before.

"You have purchased Mr. Jollybold's property, I think?" said Mr. Marker; "and very glad I am it has got into other hands. Jollybold was a bad fellow. I always had the greatest difficulty in getting my rent. Ten pound, I think, less property tax, Mr. Fingudgeon?"

I really felt it was fortunate that it was no more, and that Mr. Jollybold had not in this instance deceived me.

"And now, Mr. Fingudgeon," said Mr. Marker, handing me the receipt, "as you are a fresh tenant, I may as well see your Insurance receipt."

"I have unfortunately left it at home," I replied.

"But you have paid your Insurance, of course?"

"Oh, yes! I paid it the day after it was due."

"Very proper," said Mr. Marker. "Nothing more necessary for a leaseholder to see to than the Insurance;—600*l.* a house in the Sun Office," he suggested, referring to an account-book.

"No, sir," I said; "in the Phœnix."

"And do you know the consequence of that, sir?" said Mr. Marker, looking up from his book over his tortoiseshell spectacles.

"No, sir," I replied; "I suppose one office is as safe as another. My wife's brother being an agent to the Phœnix, I gave it to him."

"Well, sir," said Mr. Marker. "That is a breach of covenant, and do you know that the consequences of a breach of covenant are ejectment?"

"But won't the Phœnix do, sir?" I said.

"No," he replied, "the Phœnix won't do. I suppose you have not had much experience in leases?"

I told him the present was the first house property I had been interested in.

"Well then," said Mr. Marker, "I won't be hard with you as you are inexperienced, but everybody must pay for experience, so I will compromise the matter for 50*l.*"

"Fifty pounds!" I exclaimed, "and what am I to pay you 50*l.* for?"

"For a waiver of the breach of covenant. But if you prefer it," said Mr. Marker, "I'll bring an action of ejectment. It's fatal to your lease, sir, depend upon it, so you had better pay me 50*l.* than lose two or three thousand."

"Fortunately," I replied, "I am not so much interested in the property as that."

"If you have mortgaged then," said Mr. Marker, "you are open to an action from the mortgagee for the amount of his claim in case I oust you from the property; at least I imagine so. But if you don't understand these matters you had better refer me to your solicitor."

I gave him Messrs. Driver and Tartar's address, and left Mr. Marker, somewhat dispirited.

I did not like to tell my wife of these repeated drawbacks to the property, and began to inwardly curse Mr. Jollybold and the newspaper that had so unluckily raised our expectations of 27¾ per cent., and I am sorry to say also inwardly blamed

my wife for drawing my attention to the advertisement, although it was equally my fault in purchasing Arethusa Villas. I had one satisfaction, it was my own and not my wife's legacy, and she could not therefore blame me for spending her money.

I was serving in the shop the next day, when a shabby-genteel fellow, with a greasy hat, inquired if my name was John Fingudgeon.

I replied in the affirmative.

"I have to serve you with a writ of action for trespass in the matter of No. 4, Arethusa Villas," said the shabby man. Almost immediately afterwards I received a letter from Mr. Dunderly to the following effect:

My dear Fingudgeon,—I advised you not to go to law. To take the law into your own hands or to trust a bungler is even worse folly.

A man, calling himself Grinder, made a distraint on my goods and chattels on the 16th inst.

Please to look to your almanac, and you will see that the sun retired behind the horizon at 6·17 on that day. He made his levy at 6·22, which was, consequently, according to distinguished authority, an illegal act, and you thereby render yourself liable to an action, with which I shall proceed, unless you compromise the matter to my satisfaction.

I need not further allude to the attornment, as your lawyer will advise you on that subject.

I suppose everybody must buy their experience. You have doubtless bought it long since in the matter of cheese; you are now doing so in the matter of bricks and mortar. Yours very truly,

Diogenes Dunderly.

As it was now necessary that I should apply for legal assistance, I at once started off to Boswell Court to see Driver.

"I am glad you have called, Fingudgeon," he began, "I was just going to write to you. How on earth came you to alter your insurance? I have received notice of action for ejectment from Old Marker, and, depend upon it, if we don't make a compromise you will lose the property. The expenses are not much at present, but we had better come to terms with him at once."

"He asked 50*l.*," I said, "but I would not consent to that."

"Leave it to me," said Driver, "and I will make the best terms I can. He is a crotchety old gentleman."

I was obliged to consent, for I knew nothing how to proceed to conciliate Mr. Marker. I then introduced the matters of Tenants 3 and 4.

"Here's a nice kettle of fish, Fingudgeon," said Driver. "You have no answer to Mr. Kankerdale, and the result is doubtful with Dunderly."

"But is not Grinder responsible for the distraint?" I said.

"You will, of course, be made a party to the action, and Grinder is not worth a shot. His making the levy five minutes after sun-down is clearly illegal, and it is a question of some importance whether a landlord has a right to distrain upon a tenant who has not attorned to him. It will be better to compromise both cases."

I need not trouble the reader with minute particulars of these transactions. Messrs. Driver and Tartar managed to conciliate all parties at a very considerable expense to me, so considerable indeed that I was compelled to borrow upon my stock and furniture, which had the effect of weakening my credit with the commercial world. I did fortunately get my rent of tenants Nos. 1 and 2, and after six months' trouble, and a cost of 50*l.* for repairs, I got possession of Nos. 3 and 4, but without receiving any rent. They stood empty for six months, and just when I had let them at 50*l.* per annum, I received intimation from the executors of my mortgagee—who had died suddenly—to pay in the 1500*l.* Driver tried his best to get the mortgage transferred, but no one would let me have the money. I tried sale by auction, which cost me another thirty pounds, and, like Mr. Jollybold's trial-sale on a former occasion, there were no bidders, and at last the houses fell into the mortgagee's hands, and I lost my 500*l.*

The result of my speculation was as follows, for the twelve months I possessed the equity of redemption of that desirable property—Nos. 1 to 4, Arethusa Villas. My wife gave up keeping the accounts in disgust, but I have taken the amounts out of my cash-book; and, as I look over the items, I feel myself a sadder, although a wiser man.

	£	s.	d.
Purchase-money	£500	0	0
Expenses of transfer	45	0	0
Settling three actions	162	5	6
Expenses borrowing to pay above	35	3	4
Repairs to the four houses	65	2	3

Loss	£847	4	3

From this experience I would advise ignorant persons to pause before they invest their savings in the purchase of "desirable household property to pay 27¾ per cent." Venditus.

AN ARTIST'S RAMBLE ALONG THE LINE OF THE PICTS' WALL.

PART I.

It was about the end of August in the year 18— that my friend H—— and I passed by the good ship City of Hamburgh from the Thames to coaly Tyne, and landing at Wallsend, a place of fame wherever a sea-coal fire is appreciated, we trod Northumbrian ground, for the first time on the part of H——, but not so on mine, for there are few portions of that picturesque and historic land with which I am unacquainted. The object of our journey was that of a sketching tour, H—— having in view the wild moorland scenery of Tynedale, I, the vestiges of antiquity in which the county abounds. With those objects in contemplation, we resolved to take the line of the Picts' wall for our guidance, and accordingly commenced our walk at Wallsend, the eastern extremity of the wall, for it would appear that the Roman engineer did not hold it necessary to carry this great work to the German Ocean, which washes the rocky base of Tynemouth Priory, about

four miles to the eastward—a space commanded by the position of this extremity of the wall. This site is recognised as the Segedunum of the Romans, and traces of the station are still visible on the spot called the Well or Wall Laws, about six yards south of the engines of Wallsend colliery. In Horsley's time there were distinct traces of the ramparts of this work, and evident remains of two turrets at the western and eastern corners of the station, and another at the south-west corner. A wall and other works have extended to the river, where the remains of a quay and the traces of a causeway in communication with it mark the spot where, upwards of sixteen centuries ago, the Roman vessels loaded or discharged their cargoes, long ere the coal trade was dreamed of, and where now the staithes appertaining to the waggon-ways of Bigge's Main, Fawdon, Cox Lodge, and Wallsend collieries render the scene a right busy and a black one. The name of this station is derived by Wallis, the historian of Northumberland, from the Roman *seges*,—corn—and the British *dun*, a hill, and he conceives that here was a magazine for corn shipped from the more southern provinces of the empire. Although I have said that Wallsend is recognised as Segedunum, there is no direct evidence by which it can be exactly identified with the station so named in the *Notitia Imperii*, a list of the several military officers and magistrates of the eastern and western empires, with the names of the places at which they were stationed, probably composed about the end of the reign of the Emperor Theodosius the younger, before the Romans were compelled by home disturbances to abandon this island. The sixty-ninth section of this document contains a list of the prefects and tribunes under the command of the Honourable the Duke of Britain. That portion of the list which refers to the stations between the Tyne and the Solway is headed *Item per lineam valli*—also along the line of the wall, and contains references which the wall-pilgrim may consult with advantage.

Before setting forth, being anxious to tread upon sure ground, we cast about in order to obtain the best information for our guidance in identifying the several stations, and above all, to make a sure start; we therefore consulted the volume of Dr. Bruce,* the latest and best of the wall guides. The Segedunum of the Notitia immediately follows the title *per lineam valli*, but the point is at which end of the line to place it, to discover, indeed, whether we are to proceed with the names set down in the list from east to west along the line, or the contrary way. "The stations on this list are manifestly," as Horsley observes, "set down in some order, so that if we ascertain the identity of some of them, we may form a pretty correct estimate of the position of the intermediate, or neighbouring stations. When in the remains of a station inscribed stones are found bearing the name of a cohort mentioned in the Notitia, the inference is natural, in most cases at least, that the Imperial Notitia will furnish us with a key to the ancient designation of the station, and the argument is perfect when the designations thus obtained correspond exactly in the order of the places as given in the Notitia." Dr. Bruce points to an example in the station of Chesters, on the North Tyne, where several slabs have been found bearing the name of the second ala or wing of the Astures.

ALAE
II ASTVR(UM).

"Now as the Notitia represents this ala or troop of cavalry to have been stationed at Cilurnum, the probability is that the camp on the west bank of the North Tyne is the Cilurnum of Roman Britain.

"Immediately following the second wing of the Astures at Cilurnum on the Notitia list is the first cohort of the Batavians at Procolita. Now the station immediately west of Chesters is Carrawburgh, and here a slab and an altar have been found inscribed with the name of this very cohort. The conclusion is natural—Carrawburgh is the Procolita of the Notitia." In this way a succession of stations have been identified from Segedunum (Wallsend) to Amboglanna (Bird Oswald) in Cumberland; but here, from the land being more under cultivation, traces are less evident, and no inscriptions have been found to identify the stations westward of this point. No inscribed stones of any consequence have been found at Wallsend, although it is conjectured many have been worked into the masonry of the colliery for which the station served as a quarry. But this deficiency was in a measure made good by the discovery, at Tynemouth, where it is supposed there was a Roman fort, of an altar, the inscription on which reads as follows:—

I (OVI) O(PTIMO) M(AXIMO)
AEL(IVS)RVFVS
PRAEF(ECTVS) COH(ORTIS)
IIII LIGNO
NVM

From Wallsend the wall ran westward, and, passing Walker, i. e., the town by the wall, and climbing Byker Hill, it proceeded to the bank overlooking the Ouse Burn, a stream which runs into the Tyne on the eastern boundary of Newcastle, where there was a castellum or exploratory tower. Descending the hill from thence, where the fosse is still to be traced, it crossed the burn and reached the Sally Port-gate of the mediæval walls of Newcastle, where there was a castellum, and crossing the top of the hill, called the Wall Knoll, it passed a small stream called Pandon Dean, by an arch near the Stock Bridge. Ascending another hill it crossed the Lort Burn by an arch, and reached the site now occupied by St. Nicholas' Church, and formed the rampart of the next station.

Newcastle—the Pons Elii of the Notitia—has afforded a position of great strength and command. It is supposed to have taken its Roman appellation from the Emperor Hadrian, who was of the Ælian family. He rebuilt Jerusalem and bestowed on it the name of Ælia Capitolina.

Evidences that the old bridge stood upon a Roman foundation were evident on its being rebuilt after the great flood in 1771. The wall formed the

* The "Notitia" list of stations is printed in Dr. Bruce's compendious history of the Roman Wall.

northern rampart of Pons Elii. Horsley considered that each side of this station measured six chains, and that its east wall ran at right angles from the wall where the St. George's Porch of St. Nicholas' Church is situated, and continued along the brow of the hill—at the part called the Head of the Side—till intercepted by the earthen rampart called Hadrian's Vallum, near the east-end of Bailey Gate. The old castle is conceived by Horsley to have stood a little more to the south-east than the present castle, erected in the reign of William the Conqueror, and from which the town took its name of Newcastle. On the brink of a height looking down upon the bridge, masses of strong masonry and a chaos of Roman ruins were found when the ground was cleared for building the present Moot Hall; likewise a Roman doorway, walled up, a well, and a quantity of the *débris* common to Roman stations. It is highly probable that the new castle was built from the stones of its predecessor; and Brand expresses his belief that inscriptions belonging to the station of Pons Elii lie concealed in the walls of the present castle.

From St. George's Porch the wall stretched through the garden of the vicarage and intersected the line of the town wall a little to the north of the west gate, then mounting the rising ground it reached the station of Condercum. There are plans of this station, and of the Roman hypocaust, found near it, in Brand's "History of Newcastle," drawn in 1751, by Robert Shafts, Esq. Some altars and inscriptions were found here; one of them, discovered in 1669, is referred by Horsley to the time of the Emperors Marcus Aurelius and Lucius Verus. This altar is dedicated to Jupiter Dolichenus, who presided over mines, and this has led to a supposition that the coal seam of this neighbourhood had been wrought by Roman hands. Coins, bronzes, and other Roman relics, have, from time to time, been found here. For nineteen miles out of Newcastle, the Carlisle road runs chiefly upon the foundation of the wall. At East Denton the wall becomes visible in a fragment thirty-six feet long, having three courses of facing stones on one side, and four on the other. Beyond Denton Burn, the wall, turf-covered, travels with the road, but apart, for some distance, and here the vallum is very prominent. Near Denton Hall, formerly the residence of Lady Mary Wortley Montague, a mound indicates the site of a Mile Castle. Before crossing Walbottle Dean, the vallum appears very distinctly, skirting the road which here runs upon the wall again, and as it approaches Heddon-on-the-Wall, the fosse appears on the right of the wall, and the vallum, boldly prominent on the left. Here a considerable length of the wall, with four courses of facing stones, is very perfect. At this part the ditch or fosse is carried through freestone rock. About a mile to the north of Heddon-on-the-Wall are some tumuli. Past the eighth mile-stone is Rutchester—probably a corruption of Roodchester, from a rood or cross. This station is recognised as the Vindobala of the Notitia. The wall intersects its east and west ramparts. It includes an area of nearly five acres. At an ancient stronghold which has been converted into a farm-house, Hutton, in his famous Wall Pilgrimages, experienced a churlish reception, as he considered; perhaps it was only a manifestation of the canny north country way—kindly but cautious — for he himself admits that his travelling appearance was not prepossessing; but he has his fling in the following homely verse:

> I saw old Sir at dinner sit,
> Who ne'er said "Stranger, take a bit,"
> Yet might, although a poet said it,
> Have saved his beef and raised his credit.

The above tower has the repute of being haunted by a tricksy, but not malevolent sprite called Silky. The tower is reported to have been raised by William of Welton, a worthy whose strength is still proverbial in those parts. One of his feats of prowess is said to have been exhibited when age had deprived him of sight. This blind Samson, sitting outside the tower, called a plough-boy to him, and asked him to let him feel his arm, as he wished to find what sort of bones folk had now-a-days. The lad, apprehensive of his grip, held forth instead of his arm the iron plough coulter, which Will forthwith snapped in twain, pensively observing: "Men's banes are nought but girsels (gristles) to what they were in my day."

The Wall and Vallum near Heddon-on-the-Wall.

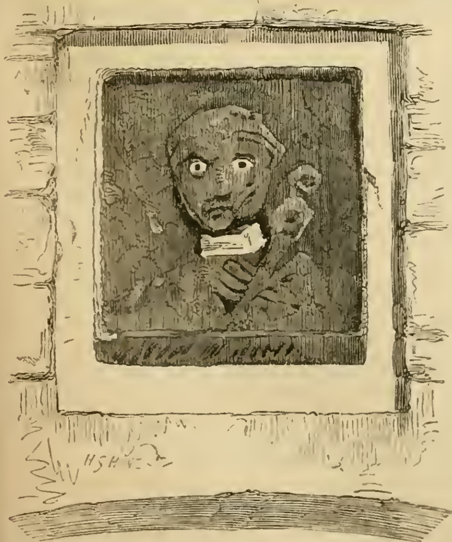
Near Halton Castle is the station of Halton Chesters, the Roman Hunnum. An aqueduct of about three-quarters of a mile in length was opened out, and it is remarkable that it lay on the north, or hostile side of the wall, where the supply of water was liable to be cut off by the enemy. The foundations of a building were likewise found one hundred and thirty-two feet in length, containing eleven apartments, the first of which was forty-three feet long, and twenty wide. It is conjectured to have been the apartment appropriated to persons waiting their turn for the bath, the other rooms being for the hot, cold, tepid, and sweating baths used by the Romans; who, doubtless, derived health and vigour from their scrupulous attention to cleanliness. The greater part of these interesting remains have been demolished and the station

itself is nearly concealed by an overgrowth of vegetation.

A little further on, the road, which here travels on the site of the wall, is carried over a small stream, by a culvert of Roman masonry four feet in width, and the same in height.

Beyond the sixteenth mile-stone, on the ascent of the hill of Stagshaw Bank, the ancient Watling Street crosses the road at right angles. This road, planned for the promotion of intercourse between the northern and southern parts of Britain, appears, in many parts, very perfect. A fort called Portgate formerly stood here to guard a passage through the wall, but no traces of it remain. We had walked thus far along the line of the wall, noting its features as we went along; but before proceeding further it was agreed that we should stay a while, both at Corbridge and Hexham, in order to make a survey of those places and their surroundings. We, therefore, returned upon our track as far as Halton Castle, and proceeded, passing Aydon Castle, romantically situated on the edge of the steep and wooded banks of a stony brook; and, anon, we found ourselves snugly established at the Angel inn at Corbridge, in the full enjoyment of a goodly refection, being a compromise between tea and dinner.

After this refreshment, we sauntered by the margin of the Tyne, accompanied by our intelligent host, to see the vestiges of the Roman bridge which crossed the river, about half a mile to the west of Corbridge. The water being low, these remains were clearly visible, consisting of large masonry with luis holes bound together by strong leaden cramps, but the traces of the station with which the bridge communicated have become almost entirely obliterated. Camden conjectures this to have been the *Curia Ottadinarum*, noted by Ptolemy, but Horsley makes it the Corstopitum of



Bust of Mercury built into the wall of a cottage at Corbridge.

Antoninus. It is said, by tradition, that King John had the area of this station dug up in all directions, in a search for treasure which, as he believed, lay buried there. On sallying forth the following morning, H—— was struck by the odd appearance of a small bust of Roman sculpture, apparently—by the appurtenance of the caduceus—a head of Mercury. This had been built in over the door of a cottage. It was painted black with a white neck-tie. While he stood, with his hands in his trousers pockets, absorbed in the contemplation of this eccentric image, the owner of the cottage stepped out, and said:

"Ye'll be admirin' ma piper?"

"Piper?" quoth H——.

"Ay, just a piper; dunna ye see the chaunter ower his shouther?"

"But what in the world made you paint him in that way?"

"What for? why to make him look bonny. Aw call him the Black Prince; ay, money a ane stops to look at ma Black Prince: some say he's King Brutus. Why, man, the Duke, hisself, smiled at it, as he walked by."

When I joined the pair, I suggested that it would be well to get off the paint, but the man grew indignant, vowing he had given the piper a coat of paint every year since he came to the cottage, and we left him. H——, however, as often as he went that way, would stop, and gaze intently on the black abomination, and the solemn abstraction of his look began to impress the iconoclast with a degree of misgiving of which I took advantage to press the removal of the paint, but though evidently shaken, he still refused to give in, until the keeper of a small chemist's shop opposite, who had joined us, pronounced the talismanic word, "whisky," in my ear.

"Now," I said, "just you get off the paint. I will order some stuff from the chemist to wash the Black Prince's face; ay! and some whisky to wash your own throat when all's done."

The victory was gained.

"There's ma thumb on't," he said; and we left him to wash the blackamoor white.

This happy conclusion was effected just as we were departing westward, and when we returned, there was Mercury restored to his original complexion, and our convert standing, with his fingers, which he had burned with the caustic agent used to remove the paint, wrapped in rags, proudly contemplating his performance. Many of the houses in Corbridge exhibit fragments of sculpture and inscribed stones from the Roman station, either worked in promiscuously, or for the sake of decoration. In one house a quern had been worked in the angle of a wall. A Roman eagle composed part of the masonry of a pigsty. Some Roman altars appeared built into the wall of the vicarage, and among the medieval masonry of a peel-tower, at the end of the town, there appeared a large Roman inscribed stone, quite perfect. The church-tower appeared wholly composed of Roman stones. In the churchyard, there is a tower which Camden calls, "a little turret built and inhabited by the vicars." H—— and I sat down in the evening to draw this tower, from points of view somewhat apart. While I was thus engaged a butcher suddenly stood before me with the head of

a black-faced ram, which he had just hewn from the carcass, saying :

"There's a pictur!"

"Yes," I quietly observed, "that would please Sir Edwin Landseer."

"O, your friend, yonder!" he exclaimed. "He shall see it," and rushing to my unconscious companion, shoved the black and gory trophy under his nose, with a suddenness that well-nigh had the effect of a Medusa's head upon him, exclaiming :

"There, Sir Edwin! match me that, if you can!"

The Corbridge folk are not possessed of much deference, especially the boys: the latter, wherever we turned, hailed us as the "strange men." While I was drawing the interior of the tower, which is roofless, I was fairly bombarded by the boys on the outside of the door, which I had secured, with volleys of stones; and when I remonstrated, saying it was very uncivil treatment of a stranger, their spokesman up and said :

"Hoot, aye! we ken nout about civility here; we're real bad uns, we are!"

Next morning, when at the same task, I saw the large eyes of a brat glowering through a loophole, and, after a long silent stare, I heard his wooden clogs clattering over the pavement, he calling: "Eh! they've getten the strange man in the lock-up, now!"

It appears the tower is occasionally used as a cage for offenders, but I was told they mostly let themselves out.

Fortified Vicarage in the Churchyard at Corbridge.

We now wended on our way to Hexham, as I was desirous of showing my companion the stately Abbey church and its Saxon crypt constructed of Roman stones, some of them bearing Roman inscriptions. The day after our arrival, being Sunday, we were setting out in order to attend Divine Service, when the handmaiden, who waited on us at the hostel of the White Hart, inquired what we would take for dinner, and volunteered the recommendation of a fool and bacon, at which H——, who had not yet overcome the dialect, looked disconcerted till I explained that a fowl was meant.

Next day we devoted to a survey of the antiquities of the place, to describe which would require more space than I can here command; but I cannot quit Hexham without mention of an odd illustration of the proverbial inch given and ell taken. In scrambling among some pigsties, that we might get a better view of part of the Abbey church, I was struck by the complacent grunt of a fat hog, in full enjoyment of his *dolce far niente*, and remarked to his owner, who looked on with the satisfied look of one who beholds a prospect of fat bacon, "Your pig is a true gentleman; he has nothing to do, and he does it." H—— told me after that the man had said to him, aside, "Sir, your friend made a remarkable observation—particler. He said ma pig was a gentleman, for he had nothing to do, and he didn't even do that." Leaving Hexham, we turned back and took up the line of the Wall, where we had left it, at Portgate, and submitted our steps to its guidance. In the plantations on the hill, after passing the seventeenth milestone, the works appear in great boldness, and, just before reaching the eighteenth milestone, we observed the remains of a Mile Castle. And now we began to descend the hill towards the north Tyne, and reached St. Oswald's Chapel. In a field near to the chapel, called Molds Close, a quantity of bones and fragments of weapons have been turned up, from time to time. According to tradition, a fight was won here, after which England rose in greatness and prosperity; but when another battle shall be won on the same field, her decline will as surely ensue. This prophecy is supposed to have a vague reference to the battle in which King Oswald first raised the standard of the Cross, and vanquished the fierce British chief Cadwallon. In commemoration of this event the convent of Hexham erected the chapel in honour of St. Cuthbert; and the canonised saint Bede, who calls this fight the battle of Heavensfield, says it was fought just north of the Roman wall, and informs us that "It was a custom continued a good while before his time, for the monks of Hagulstad (Hexham), who lived near that place, to go thither every year, on the day before that of his death, and there to say vigils for the health of his soul, and the morning after to offer the sacrifice of the holy oblation, with lauds to him." A large silver coin or medal of Oswald was found on repairing the chapel. In the grounds of Brunton, still lower down the hill, a remarkably fine fragment of the wall appears. It is seven feet high, and contains nine courses of facing stones entire. At Chollerford, the North Tyne was crossed by a bridge, the remains of which are now in process of excavation, and present a striking example of Roman masonry, being of a very massive character, and finely wrought and jointed. Approaching the bridge from the east, the works are quite perceptible. On the west bank of the river is Walwick Chesters, identified with the Roman Silurnum. Here we look down upon the ground plan of a Roman station, with its narrow streets, at right lines, as we might look upon a plan drawn out upon paper. The station contains an area of upwards of six acres; it is of the customary parallelogram form, the corners being slightly rounded. Between the station and the river are the traces of

suburban buildings. Within, and near the middle of the station, is a vaulted chamber, or cell, which is entered by a descent of four steps. At the threshold was found the original door of wood, sheathed with plates of iron, the whole being firmly riveted together with large square nails. The roof is vaulted over, and the side walls incline slightly inwards. Some excavations near the eastern rampart have brought to light a series of eight apartments. A street, three feet wide, increasing to four feet, is met at right angles by another, paved with flag stones, which leads to the entrance of a large apartment, under the floors of which are flues for warming the building, similar to those at Halton Chesters. In one of the rooms a cistern, or bath, was found. From this chamber passages on the right and left lead into apartments, in one of which the statue of a river god—perhaps, it has been surmised, the genius of North Tyne—was found. This figure is much superior to the ordinary pitch of Roman provincial art. Indeed, although carved in a coarse material, it is conceived in a high style of design. A bank, overhanging the river, at a short distance from the station, is conceived, from the discovery of several sepulchral monuments, to have been the Roman cemetery. It is a spot well suited to the quiet and sanctity of death, the west wind sighing through the grove that overshadows it, and the river flowing round the base of the hill towards the most beautiful of its many fine curving sweeps, might sound to the fanciful ear like an everlastingly murmured dirge for the repose of the departed who rest there.

At Walwick Chesters, many fine pieces of sculpture and architectural fragments are preserved, together with a dedicatory inscription of the soldiers of the second wing of the Astures, which appears to have been appended to a temple. This having fallen to decay, was restored by command of Marius Valerianus, under the superintendence of Septimus Nilus, Prefect. This stone has the peculiar interest of having furnished the key by which the succession of stations became identified by collation with the Notitia.

On the summit of Warden Hill, sometimes called Castle Hill, to the south of the Chesters, and near the confluence of the North and South Tyne, there is a circular camp, which comprehends an area of about two acres. The circular form indicates a British stronghold, but it may have been appropriated by the Romans as a look-out post, as it overlooks the country surrounding the station and bridge to a considerable distance. This elevation commands a fine view of the vale of the South Tyne, on whose southern bank the venerable towers of Hexham are conspicuous. Following the works over the hill of Tower Tay, from the summit of which an extensive prospect is obtained, including the groves of Nunwick, and, on the other bank of the North Tyne, Chipchase Castle, the ancient stronghold of the Herons, a bold undulation of hilly country is bounded by the grey peaks of the Cheviot Hills. Near Tower Tay are the remains of a Mile Castle. Here the fosse of the wall and the vallum are hewn out of the solid basalt rock.

The next station, being the seventh, on the Roman line, is Carraw, the Roman Procolita. It was garrisoned by the first Batavian cohort—that which fought with Agricola against Galgacus, in the great battle of the Grampian Hills. A mutilated stone, bearing the word BATAVORUM, was found among its *débris*. This station is a mere heap of shattered ruins. Leaving Carraw, we have before us a succession of four mountainous ridges which face the north in crests of perpendicular crags, some higher than others, and forming a mass of basalt that crosses the country in a rugged line bearing north by east to the sea at Holy Island. The wall rises boldly as we approach the central portion of the barrier, which, in harmony with the scenery, pursues a more determined course, and presents itself in more imposing masses. Where the wall tops the crown of the crag, the north fosse disappears, and the vallum follows the course of the wall at the bases of the hills. Those inaccessible precipices offer to the north a barrier to which the wall cannot have added strength, and it must have been carried over them chiefly to shelter the guards and sentinels against the bitter northern blast.

On the side of the hill at Sewingshields are the remains of a Mile Castle. From this height, looking northward, a dreary stretch of waste and moss land extends from the base of the crag as far as the eye can reach, while, on the south, the view is rich and extensive, Hexham being clearly visible, nestled in an inflexion of the woody banks of the Tyne. Northward of the crag, there stood a border tower, called Sewingshields Castle, but not a stone remains. It is said to have suggested the idea of Scott's "Castle of Seven Shields." A buried treasure, it was believed, lay concealed within its walls.

Seven monarchs' wealth in that castle lies stow'd,
The foul fiends brood o'er them like raven and toad.
Whoever shall guesten these chambers within,
From curfew till matins, that treasure shall win.

But as there is no longer a chamber to "guesten" within, the adventure is nought, and the prophecy fulfilled.

The waste ridge of Cheviot shall wave with the rye,
Before the rude Scots shall Northumberland fly,
And the flint cliffs of Bambro' shall melt in the sun,
Before that adventure be peril'd and won.

Among some traditions told by the people hereabout, I select one communicated to Dr. Bruce by Mr. Adam Cranston, Master of Grindon School, relative to an odd plan practised by the Scots of angling for Romans. "The Romans are said to have been remarkably lazy, so much so, that in the hot weather of summer, having almost nothing to do, they lay basking in the sun, on the south side of the wall, almost in a state of torpor. The Scots were in the habit of watching their opportunity, and, throwing hooks with lines attached to them, over the wall, caught the poor Romans by their clothes or flesh, and by this means dragging them to the other side, made them prisoners."

In some of the local traditions, King Arthur and Queen Guenevra are the hero and heroine. A column of basalt in the neighbouring crag is called King Arthur's Chair.

Beyond Sewingshields is a gap in the crag,

called the Cat Gate, which may have been used by the Romans as a sally-port, when they made a foray on the Scots. Next comes Busy Gap, where the wall, being more upon the level, is greatly exposed, and a provision has been made for increasing its strength by the projection of a triangular rampart to the north. Busy Gap was notorious of yore as the chief resort of border reivers and mosstroopers. To this place of ill repute Camden refers, as "a place infamous for thieving and robbing," and says, "I could not with safety take the full survey of it (the wall) in this neighbourhood, for the rank robbers thereabout." In Newcastle, formerly, to call a brother burgess "a Busy Gap rogue," was a matter liable to the censure of a guild, as is attested by an entry in the books of the Company of Bakers and Brewers of Newcastle-on-Tyne. A custom still kept up in Newcastle is significant of the terms which the townsmen held with those of the more immediate border. At eight o'clock on the eve of the day for holding the annual horse and cattle fair, the great bell of St. Nicholas is tolled.* This is called "the thief and reiver bell." At the close of the fair the bell is again tolled. This custom was formerly intended to intimate a kind of armistice, by virtue of which the Bordermen were to consider themselves free to come and go, unquestioned and scatheless, during the interval between the tollings of the bell.

The next Mile Castle is situated opposite to a farm-house called the Kennel. Hodgson describes it as having, when it came under his notice in 1832, an interior wall on every side, and conjectures that the central area had not been roofed over, but only the space between the double walls. Something similar is observable in the imputed Celtic building of Chun Castle in Cornwall, and the Norman keep of Coningsburgh Castle in Yorkshire, the space between the double walls being reserved probably for dormitories and that in the centre for cooking, eating, and in-door recreation. Housesteads, the Roman Borcovicus, is allowed to be the finest position upon the Roman line. The impulsive Stukeley terms it the Tadmor of Britain; Dr. Bruce, with greater propriety, the British Pompeii. When Stukeley saw this station, the very disorder of its ruins may have had its effect on the imagination; but now, the progress of excavation has created a more intelligible interest in the light thus thrown upon its order and details. The inscriptions, altars, statues, and fragments of sculpture, which raised the admiration of former visitors, are now to be sought for in the Museum of the Society of Antiquaries of Newcastle, but the gates, streets, and divisions of the station, so far as the excavations have reached, present a series of details calculated to excite the most lively interest. The four gates of the station have been cleared. They are double, so that the station is only accessible by passing through two lines of defence. The gateways have been closed by heavy two-leaved gates. The jambs and pillars of all the gateways are composed of large and massive stones of rustic masonry, the central pillar, taken at the second course of masonry, measuring six feet square. Between each portal is a large stone on which the gates have closed. On either side are guard-rooms, nearly perfect, with the exception of the roof. At the south gateway and outside the wall of the station there is a building, concerning which H—— and I had some discussion, my notion being that it was the bakery of the station; and while I was trying to prove this, a shrewd looking labourer, who was poking about some *débris* at hand, observed, "If you'll excuse me, gentlemen, its nowther the one thing nor the 'tother of what ye're talkin' aboot."

"Indeed!" I asked, "And pray what may it be?"

"It was just Johnny Armstrang's malt-kiln," was the reply of this second Ochiltree.

A little upwards of a century ago Housesteads was possessed by a family of the name of Armstrong, descendants of the famous Johnny, who sold it and the adjacent land for the sum of fifty-eight pounds. The farm now lets at the rate of three hundred pounds of annual rent.

At this suggestion of our new acquaintance, we were induced to view this building with a medieval, rather than a Roman eye, and it became evident that the subject of our inquiry had been no other than the Peele of some reiving Armstrong, consisting of a basement, wherein his cattle were housed, and over this a tower in which he had his abode, and, behind, a kiln in which he dried his corn: for in the days of Border strife, when one man sowed and another reaped, it was not always expedient to leave a crop till it should mature into full ripeness. The compactness with which the streets and houses are packed within the walls of the station indicates the necessity of housing a large body of men in as limited a compass as possible. The houses are very small and the streets exceedingly narrow. One street led from the north to the south gate, which appears to have been crossed by another from the east to the west gate, the centre being marked by a large square column. Traces of more spacious buildings appear in the northern quarter of the station, one of which measures seventy feet in length and eight feet in breadth. This has been, apparently, a chamber for the transaction of public affairs. Two hypocausts have been found within the walls, and one outside the station, by the Knag Burn, a stream which runs to the eastward; in the latter the flues were found to be full of soot. The station of Housesteads includes an area of nearly five acres. The suburbs have been very extensive. A little to the south, extending westwards, the hill-side has been scarped in flights of terraces similar to the hanging vineyards seen in Italy and on the steep sides of Lebanon. A stone-cased well of Roman masonry lies a little to the west of the station, but none has been discovered within its walls. In the Notitia, Borcovicus is the station of the *Cohors Prima Tungorum*. Inscriptions having reference to this cohort have been found in the station.

J. W. Archer.

* The great bell of St. Nicholas still performs one or two other old-fashioned functions. It still tolls the curfew, which, in my recollection, was the signal for a general closing of shops. "The great bell of St Nicholas Church," says Braud, "is tolled at twelve o'clock at noon on this day (Shrove Tuesday), shops are immediately shut up, offices closed, and all kinds of business ceases, a sort of little carnival ensuing for the remaining part of the day." This is called the pancake bell. I believe it is still rung, but the closing of shops has long been discontinued.

THE SILVER CORD.

BY SHIRLEY BROOKS.

CHAPTER LXXXVI.

When Mr. Berry left Mrs. Hawkesley, after the interview in which he had made his strange revelation, he went over to Canonbury Square, and sent in his name to her father.

Archibald Vernon was in his favourite position, on a sofa drawn so comfortably near the window as that the light fell full upon his newspaper, while the curtain shaded him from the glare. He was, of course, in a morning robe and slippers, and the air from the opened sash played pleasantly with his soft white hair—once or twice he had permitted himself the fancy that he was somewhat in a draught, but having deliberately balanced the comparative inconvenience of moving, and that of enduring the slight breeze, he had decided in favour of bearing the latter until some one else should come in and close the window for him. And he was deep in the long-winded sentences of a President's Message.

Mr. Berry followed close upon the servant, and Mr. Vernon, though rather vexed at being interrupted so soon after breakfast, rose to receive him with the courtesy habitual to the man whom the world had used so ill.

"It is some years since we met, Mr. Vernon," said Berry, "but I need not recall myself to your recollection."

"My sojourn in Lipthwaite," replied Mr. Vernon, smiling, "was so pleasant in many respects, that I am not likely to forget a Lipthwaite friend. Pray sit down."

And being on his feet, Mr. Vernon availed himself of the opportunity of closing the window.

"Have you read the Message?" he asked, pointing to the "Times." "It is singularly interesting."

"What message?" replied Mr. Berry. "Some telegraph?"

"The President's Message. We have been expecting it most anxiously for some days."

"Not I. I really forget who is President, and I am sure I did not know that he was going to issue a message. I suppose that it is all moonshine and verbiage, as usual?"

"I see you retain your old Tory notions, Mr. Berry," said Mr. Vernon. "We used to battle over them in Lipthwaite, you will remember. Do you recollect contending that the barren platitudes we call a speech from the throne were better than the well-reasoned and eloquent essay which a republican president addresses to the people?"

"I dare say that I did. I know that I should take the same side, if I cared enough about politics to discuss such matters now."

"Now, my dear sir? Why, politics now have a commanding interest, a grand importance which they have never had before. Every event has its significance, and all events are tending to bring on a great and mighty change, a regeneration of mankind."

"Mankind wants regenerating, badly enough, but I don't suppose it will be done by Presidents' Messages and newspaper gabble. However, if such things amuse you, you are right enough to look after them. I shall not interrupt your studies very long, but I shall be glad of a little conversation with you."

"Nothing disagreeable, I hope," said Mr. Vernon, with sincerity, and looking keenly at Mr. Berry.

"We are both of us too old to be afraid of disagreeable subjects," said Berry, who was in no mood to make allowances for the selfishness of his companion.

"The less time we have before us, the more pleasantly we should try to occupy it," said the other. "That is one of the pieces of wisdom which my white hairs have taught me. But, of course, if you feel that there is anything I ought to hear—though I would much rather it were put into writing—"

"I have been a lawyer, Mr. Vernon, and we write when we do not mean to come to the point. I shall not detain you long, and I cannot write what I wish to say."

With a wistful look at the paper, which Mr. Vernon knew would be called for in less than an hour, he begged Mr. Berry to proceed.

"I shall make no apologies to you, Mr. Vernon," said Berry, "for bringing a painful subject before you, for I am certain that as a father you will feel that none are needed."

"Painful," and "a father." The first word was a good deal stronger than "disagreeable," and the second called up a still more unpleasant train of recollections in the mind of Mr. Vernon. How he wished that he had gone out for the walk which he had always intended to take after his breakfast. But there he was, and there was no escape for him.

"None of my children ill?" he said.

"I suppose that, if so, it would hardly have been left to me to inform you."

"Nay, I did not know. Canonbury is a good way from my daughter Beatrice's, and Laura is still, I suppose, in some part of France. To tell you the truth, I do not see either of them quite so often as when we were all at Hermit Hut. But I am glad to hear you say that nothing is the matter."

"I said nothing of the kind, Mr. Vernon," said Berry, whose manner, formerly so genial, had become incisive and unpleasant. "Ill-health is not the worst thing that can come upon us."

"In my mind, the very worst, except perhaps poverty. I hope that, as a professional man, you do not come to tell me of any pecuniary misfortune."

And Archibald Vernon thought, uncomfortably, of the regularly paid rent for his very comfortable board and lodging, and that a quarter would be due in a short time.

"No, sir. But I come to tell you of something that should affect you more than either of the misfortunes which you have mentioned. When I have told you, I shall leave it to you to act as you may think your duty dictates."

"To act" was another phrase that grated upon Vernon's organisation, but he had sufficient reliance upon his own powers of self-conviction to assure himself that it must indeed be a powerful cause that should drive him to any action more distasteful than writing a letter, or perhaps entering a series of protests in his private diary. So he listened with the composure which we feel when we have our destiny in our own hands.

It must be allowed that the tone of his companion was not one calculated to overcome the passive resistance of Mr. Vernon.

"You are a thinking man, Mr. Vernon," said Berry, almost sneeringly, "and, therefore, I address myself to your head, and not to your heart."

The speech was abrupt and offensive, and Vernon felt it, and said with some dignity:

"You will deliver your business in your own way, Mr. Berry. I trust that it may be less disagreeable than the manner in which you seem inclined to open it."

"I dare say that it will excuse any defect in manner, sir. I am too old to be very fastidious, and you are not, I take it, much my junior."

"I am unaware that we are ever too old to be courteous, Mr. Berry."

Mr. Berry looked at him for a moment, and might have intended to make a more harsh reply. But, after a pause, he said:

"Mr. Vernon, when you were in Lipthwaite, I had some opportunity of observing the mode in which you educated your children. I have a perfect recollection of having more than once made you aware that I did not think your system—if it deserved the name—was a proper one, or that it would be attended with happy results. I recollect, also, that though you were always prepared to debate the affairs of Europe, or of Madagascar, or any other place, with the utmost fulness, you showed a touchy impatience at hearing a word upon matters that really concerned you. On one occasion, the last, you met me with an answer that prevented my ever alluding to the topic again."

"It is years ago, Mr. Berry, and I do not remember the circumstance, but it was not unna-

tural that I should decline the advice of a gentleman who had no kind of right to offer it."

"I will not say that I had no kind of right, sir, for it happened that, at the time, I filled a public office in our town, and certain matters came under my knowledge, partly because of my filling that situation. But I used my own judgment, and I decided that I was not warranted in saying more to you than one acquaintance might say, in private friendship, to another. It might have been better had I been less scrupulous, but that consideration is now beside the question. Let me go on to say that subsequent circumstances seemed to show that you had been more fortunate than I thought you deserved to be. Each of your daughters married, and married well, and appeared to lead a happy life. There was, therefore, no more to be said."

Mr. Vernon made no reply.

"I heartily wish," continued Berry, "that it had never been my fortune to bear again of any of the ladies, except that they continued to be good wives to the husbands whom they had been so fortunate as to secure."

"Mr. Berry," said Vernon, reddening, "I do not sit here to listen to anything implying that any husband whom a daughter of mine could marry was not at least as much honoured in the marriage as she could be."

"Those words and that look, Mr. Vernon, would well become a father who had fulfilled his duties to his children, instead of bringing them up with no care except what a day-school could afford, but from you they are simply vain and arrogant. Hear me out, sir. The politics of Europe, and of America," he added with a glance at the paper, "have engrossed your attention so much, that you have not had enough time for so unimportant a question as the position of your own children. A stranger, therefore, has to call upon you, and inform you that of the three children whom you brought up so well, and whose alliance did so much honour to their husbands, one has disgraced her husband, and has fled from France to England to avoid his vengeance, and another has abandoned her home, and fled to Paris, and, as her husband has reason to believe, for the same cause that drove away her sister."

Archibald Vernon, who, at the outset of this brutal speech, had gazed fiercely at Berry, and seemed but to await its close in order to lay a violent hand upon him, turned suddenly pale as the last sentences were uttered, bowed his head into his hands, and broke into weeping.

Mr. Berry looked on with a cold eye.

"I have seen a good deal of suffering in my time," he said in an under-voice, and as he walked to the other end of the room, "but I never noticed that a man who cried suffered long."

And he compared his watch with the clock upon the mantelpiece.

"You have no doubt as to what you are telling me, I am sure," said Mr. Vernon, raising his head, and speaking in a voice of distress.

"I wish for their sakes, and for that of their sister, that I had any doubt," said Berry, from the hearthrug.

"But—but," said Archibald Vernon, rising, and approaching him, "you have not mentioned a name. Which—which—is it Mrs. Urquhart?" he added, in a troubled whisper.

"Mrs. Hawkesley is in her house, and doing her duty," was Barry's indirect reply.

It were harsh to say that a ray of comfort shot through the mind of the father at this assurance—yet it was Beatrice who had the charge and care of his welfare, and it was to her that he turned in any of his small and self-made troubles—let it be said only that the news that his eldest child had gone would have grieved him more deeply than the fate of the others.

"And such is destiny," said Vernon, placing his handkerchief to his eyes, and returning to the couch, on which he threw himself in a despairing manner.

"Destiny!" repeated Berry, again glancing at his watch.

"I have nothing to reproach myself with, Mr. Berry," said Vernon, rising again after some minutes, during which his companion watched him calmly, and without a single word or sign of sympathy. "I repeat that I have nothing to reproach myself with. I acted upon my own conviction that I was pursuing a right course, and if circumstances over which I have had no control have brought grief and sorrow, I can only mourn, but I have no right to condemn the system on which I proceeded. Still, it is sad—most sad."

And again he covered his eyes with his hands.

"I will give him a quarter of an hour," said Berry, "to convince himself that all is well."

"Yes, Berry," said Mr. Vernon, in a melancholy tone, "I am cut to the very soul, but I will not be untrue to my principles. Poor girls, poor girls. The fault is not with me. I am not responsible—deeply, profoundly as I feel the grief. You have differed from me, Berry, as to the mode in which children should be educated, but you will do me the justice to own that I adhered sedulously and conscientiously to my system. I held, and I hold still, that the heart of a child is the flower-garden which it is not for man to lay out according to his own presumptuous fancies—"

"But he should leave it to the devil to sow tares in," said Berry, roughly.

"The devil," said Vernon, raising his hand in deprecation of its being supposed that he believed in such a being, though he was then in too much distress to argue the question. "We have thought differently, my dear Berry, and your views now seem to be triumphant. Poor Laura, poor Bertha!"

"He is comforting, fast," muttered Berry.

"I have not been to blame, I solemnly declare," said Archibald Vernon. "I have sacrificed myself, indeed, and my opportunities, for my children. It was in compliance with the will of narrow-minded relatives, who meant, I am sure for the best, but who were bigoted beyond description, that I buried myself for years in Lipthwaite, where my talents were unavailable, and I could take no part in the great questions of the day. I went further, and if there be any blame attaching to me, it is in this, that I yielded to the will of those relatives, and for the sake of the comforts which their money gave to my dear ones, I per-

mitted them to go to the school in your town. I might have done better to have kept them at home. Yet I am conscious that if I yielded, it was for their sakes, and that I never compromised my own belief that it is not for us to seek to form the natures and characters of one another. Had they not, dear things, gone to that school, they might have been saved from this grief and evil."

And amid all his feeble folly, Vernon unwittingly spoke the truth in these last words.

"He is consoled," said Berry, once more looking at his watch. "And it is under the time. So much for tears."

"You bear this heavy blow well and manfully," said Mr. Berry, "and I was right in saying that I would appeal to your head, not your heart."

But either the tone, or some instinct of nature, made this speech unpleasing to Mr. Vernon, and he turned away in silence.

"I will waste little time on him," said Mr. Berry, contemptuously.

He read the man, but it was in the coarse way, that takes no account of the foot-notes and marginal readings. Those who, early in our story, learned to know Vernon better, will perhaps have fuller knowledge of him. But that weak and superficial nature (inherited by his second child, Bertha, but in her case made painfully frivolous by the want of intellect, and made actively selfish by a feebler organisation than his own) was of the class which beyond most others excites the scorn and hate of a busy, practical mind. Judge Vernon by what we know of him, but do not judge Berry for knowing less.

"I have broken the news abruptly to you, Mr. Vernon," he said, "for with such a story in one's mouth, it is difficult to frame one's lips to delicate language, and when one speaks to a man of resolution and character, the sooner one's news is broken the better. But I beg your pardon if I have been hasty, and I will only say that if you knew what cause of sorrow I have in my own household, you would not be angry that I have few words to spare for the troubles of others."

Mr. Vernon had waved his hand slightly as Mr. Berry began, but, as he concluded, Vernon came up to him, and placed his hand in Berry's.

"You, too, are in affliction?"

"I have left a wife who is, I believe, dying."

"Ah, my friend," said Vernon, "I, too, have known that sorrow. But it came to me when such blows are bitterer."

"I do not wish to speak of my own grief," said Mr. Berry, "but you will remember it when you recall this conversation. But to return to your own family affairs."

"I have heard enough for one sad day," said Vernon, seating himself, with one hand on the end of the couch, and with his handkerchief shading his eyes.

"But you must hear me out, Mr. Vernon," replied Berry, "for it is not probable that we shall meet again, and I have something to add."

"You have no new sorrow to tell me—surely I have nothing to hear that will add to my sufferings?"

"You have asked me for no details, Mr. Vernon."

"Nay, spare me those. I could not bear them. It is enough to know the terrible truth."

"But you have imperfectly listened to what I said, or you would have been eagerly questioning me. I said that in the case of one unhappy person, there was—there were circumstances that would make any action on your part, or that of the family, worse than useless. But in the case of your youngest child you could not have heard me say that there is only a belief that she has forgotten her duty."

"Did you say that? I was so stunned by the first intelligence that I did not catch your words. Pray—pray explain."

"Without going into needless detail, accept this as a fact. Mrs. Lygon fled from her home, but it was partly to obtain the possession of certain letters, of which a dreadful use has been made. Mr. Hawkesley and Mr. Lygon are also in Paris, and they are endeavouring to get at those letters. If they or Mrs. Lygon obtain them, the first impulse will be to destroy them with all their foulness and treachery. If that be done, your child's happiness is gone. Will you believe this from me?"

"Unquestionably. I have known you long and as a man of honour."

"You believe this without asking more questions?"

"Fully."

"And you love your child?"

"Love my own Laura!"

"And you have influence with her?'

"As much as a loving father can have. My youngest child, and perhaps my favourite, though dear Beatrice—"

"You have influence with Mrs. Lygon—pardon my abruptness."

"I have indeed, I hope."

"Then do not lose an hour, but go over to Paris as fast as possible, and see her, Lygon, and Hawkesley, and impress upon them with all the force in your possession that they must bring those letters to England. Do not wait to understand why—you will understand that too well when all is explained, but go at once—go by to-night's train, and help to save your child."

"By to-night's train!" repeated Mr. Vernon, aghast.

"Yes, for a train lost may lose the object, and you will then repent the delay to the last hour of your life."

"I am in no state to travel," said Mr. Vernon, dropping each hand by his side, and looking exceedingly wretched. "Night travelling too. Besides," he added, instinctively feeling that he needed some other justification, "I must see my daughter, Mrs. Hawkesley. I must consult and deliberate with her, and ascertain her convictions as to the propriety of this course."

"I come direct from her, and she begs and implores that you will hurry off to Paris."

This was said so emphatically, that Mr. Vernon received the announcement in helpless dismay.

"But Paris," he stammered, "that is a wide direction—"

"The exact directions are written down on this paper."

"This is most extraordinary. I really feel that I must have time for reflection."

"You have said that you fully believe all I have told you, and that you have influence with Mrs. Lygon, and your daughter Beatrice urgently entreats you to go—you speak of self-sacrifice for the sake of your children, and I am sure that you will not hesitate when you see what vital interests are concerned."

"I would do anything—that is—anything that is reasonable"—said the now thoroughly unhappy Vernon. "But surely a letter—if I were to write to her—it would arrive at the same time, and it would be kinder to her, and more delicate. It would be painful to her to meet her father's eye under the circumstances, and clearly it seems to me that a strong letter—I will write it immediately—"

"It would not reach her, and all will be lost. You, on the contrary, will be with her in a few hours."

"If there were no other difficulty," said Mr. Vernon, "and I see many objections which must be removed before I admit that there is no other, the journey is a long one, and it so happens that—"

"There are twenty pounds, in sovereigns," said Mr. Berry, placing a packet on the sofa beside Mr. Vernon. "You have only to call at this address for a pass, which will be given as a matter of course, and you have nearly all the day before you."

"But my preparations," said Vernon feebly, for he felt heartily ashamed of his attitude of resistance, and yet could by no means bring his mind to the idea that in a few hours from that time he should, of his own will, order a conveyance, and depart for France.

"Preparations—for a night's journey? Take nothing, and get what you want in Paris. The train leaves London Bridge—there, I have written down the exact hour for you. I will say no more. If you go, you may save your daughter—if you do not, believe that it is destiny that has destroyed her, and see what kind of comfort that thought will be upon your death-bed. Do something to atone for the system of neglect that has brought about such misery."

He went out as he spoke. And he had better have left the last words unspoken. For Archibald Vernon was ever one of those who think more of words than things, and who think last words of more significance than the first.

Vernon echoed that last sentence, and pondered upon it, and the longer he did so the more comfort it brought him in his present trouble. Not for the trouble, not the sorrow that the tidings of Berry had caused—for those he had an ample recognition, and they were to be considered and deplored in due course—but his own immediate exigency now demanded all his thought. Before Berry had left, Mr. Vernon had fully resolved that he would write, at all events, before thinking of moving—but how to justify this to himself? He had nearly succeeded, by dint of the hundred objections to action which ever spring to the aid of one who seeks them—when the charge of Beatrice, the direct, urgent charge of the daughter who chiefly ministered to his own comforts came upon him, and he had almost yielded to the belief that he should depart on the errand.

But Berry's last words came to save him.

"'Atone for the system of neglect that has brought about such misery,'" he repeated once more. "How dares he, how dares any man speak thus of the convictions of another? This man, of all, whose whole life has been given to the coarse and selfish prosecution of a pursuit for which there would actually be no place at all, were society what it should be. First, a hard and greedy lawyer, and then, when I knew him, the puppet-official of a miserable borough, a man who blustered at the poor, and fawned upon the rich, and made his gain by it, building himself a house, and buying the land of some client whom he had oppressed into selling it. That man dares to come to me, and in my own room to tell me that my system has brought my children to wrong. And am I to bow to his bidding, and hurry to Paris as if I were his clerk? No. I will not stoop to that humiliation; and dear Beatrice, though she may be angry at first, will own that I was right to vindicate myself. This money is, of course, hers, and I will return it the first time I can get over to Maida Hill. But I will write to Laura—and to make sure that she receives the letter, I will send a copy to Charles and to Arthur. That will be the most prompt and secure method of acting. Dear Beatrice wishes me to go, but her busy mind has not had time to comprehend the delicacy of Laura's position. Beatrice does not, at the moment, see how painful it would be for Laura to meet my eye, but will feel this when I explain the reasons for my course. I will go over to her the first thing to-morrow—or rather, I will write and tell her what I have done, and ask her to come to me, and take away her money. That is clearly my course, and I regret that Berry left the house before I had time to announce to him what it should be. I will, however, write to him also, in a few days, perhaps when I receive a reply from Paris. A coarse, greedy, ignorant man—yet useful enough in his way, I doubt not. Poor Bertha, poor dear child. I should like to hear her own story of her life. When the fitting time comes, I will ask her to send it me—that vulgar lawyer has but one word for every shade of error, and who is he that he should judge a gentle, sensitive woman?"

Many more reflections of this kind occupied Archibald Vernon. Did he deceive himself, or did he endeavour to do so? One would not decide. But as the letters for France could not depart till the evening, a reader will scarcely be surprised at hearing that, after a sigh for the sad things that had come upon his family, Mr. Vernon read to the end of the American Message, or that the letters required too much consideration to be dispatched that day. What the father had been in his youth, he proved in his age.

Mr. Berry had no further business in London, and yet he seemed in no haste to leave it. He chose to walk from Canonbury to the city, although a young walker must have stepped out

well to save the next train for Lipthwaite, and although there was not another until late in the day. Yet we have heard what he told Mrs. Hawkesley of one whom he had left at home—we have heard him repeat to Vernon that a dying wife lay there, and he had spoken the truth.

He went through the formality of entering the station, and of looking at the clock and time-bills, and seeing that he had missed the train. He then took careful note of the next departure, and went out. And the old man turned back into the old city, and wandered aimlessly through the narrow and quaintly-named streets and lanes, sometimes standing still with no apparent object, sometimes watching the sturdy labourers, as they loaded or unloaded carts, and sometimes following with his eye the slow ascent of huge sacks to the hooded doors of the warehouses—but Mr. Berry could have given but poor account why he had stood still, or what he had seen. But he wandered on, and twice crossed the river, by different bridges, and lingered so long upon the lonely arches of one of these that he became an object of interest to an officer on duty, who watched him so sedulously that even Berry himself became aware that he was dogged.

"You seem to know me," he said at last to the policeman.

"Well, no, sir," said the officer, whose shrewdness told him that the stranger was eminently respectable up to that moment, whatever might be his views for the future; "but don't you find it rather hot, walking about here so long together?"

"It is hot, is it?" said Mr. Berry.

"I would not walk here, if I had no call to it," replied the officer.

"Ah! if you had no call to it," repeated Mr. Berry, mechanically. "Well, perhaps I have no call to it."

"Then I would get in the shade, off the bridge, sir."

"In the shade, off the bridge. I dare say that you are quite right. When *you* come off the bridge here is something to help to cool you."

He put a shilling into the hand of the man, and walked away, but the present, though not unaccepted, did not prevent the officer from following pretty closely, as if to be ready should the suspected man take his advice, and suddenly place himself in the shade and off the bridge by a spring from the parapet. Once through the gate, and Berry's life would be in charge of some other initial and number.

But Mr. Berry had no such thought as that which entered the mind of the officer, and he returned to Lipthwaite by the afternoon train.

Every one about the station knew him, and he imagined that more than one person who would, ordinarily, have addressed, or at least recognised him, seemed to keep out of his way. This idea took stronger possession of him when, in a street leading to the station, a gentleman with whom he was rather intimate crossed over, and thus avoided speech, although saluting Berry as they passed.

"It has happened," he said, "and they don't want to tell me."

He walked out less rapidly in the direction of his house, with that strange sensation which we experience when making our way to a scene in which we are to meet a new expression on every face around us.

At the gate of his house was the carriage of the medical man who was in attendance on Mrs. Berry.

"Is he still here? I am too late—and too soon."

But as he opened the gate, the doctor came from the house, and shook hands with him.

"Well, we are low, but not more so than yesterday," said the medical man, in answer to Berry's look. "There is great persistency, great persistency."

Mr. Berry did not ask for an explanation of the word, but manifested evident relief.

"I had feared to hear a worse account," he said. "My visit to town was on the most urgent business, as you may imagine."

"Certainly, certainly. And this kind of thing may continue a long time, and yet may be abruptly terminated. There is no new symptom to-day. But I want to say a word to you," he added, they being within hearing of his servant. "Just take a turn with me in the shrubbery. She is sleeping now, so that you could not go up. Just a word."

CHAPTER LXXXVII.

The boat from Boulogne to Folkstone was loosed from her moorings, and was beginning her way between the piers of the harbour.

Laura was on board.

She had gone down into the cabin, from an instinct that made her avoid heedless observation, rather than with any view of concealment, and she designed to come on deck again as soon as the vessel should be well on her course. In her hand, from which it never seemed to part, was a large packet, carefully sealed, and directed, to provide against any possible accident, with the address of Mr. Hawkesley. But the care which Mrs. Lygon bestowed upon her charge seemed to render it in the highest degree improbable that it would escape from her keeping.

To the surprise of the few passengers below, the vessel suddenly slackened speed, which it did not resume.

Three or four hurried on deck, to ascertain the cause of the delay, but Mrs. Lygon remained below, almost alone.

She quietly waited the resumption of the voyage, attributing the delay to some casual obstruction, when the steward entered the cabin, and spoke to the only two persons who were in it, besides Mrs. Lygon. They looked a little surprised, but with much docility obeyed the man's invitation to come out with him.

Laura was alone. The next moment there entered a tall gentleman in plain clothes, who advanced towards her, raised his hat, and in English, but with a slight accent, begged to know whether he had the honour of addressing Mrs. Lygon.

Somewhat tremulously, Laura replied in the affirmative.

"In that case, I have also the honour of bearing a message to Mrs. Lygon."

He handed to her a telegraphic dispatch. It was from Charles Hawkesley. And it said,

"*Have no hesitation in handing to the bearer what he will ask from you. It is absolutely necessary. Fear nothing.*"

"Does the message explain itself, Madame?"

"I know the name of Mr. Hawkesley," replied Laura.

"He instructs me to ask you for a packet. By the description in the message to myself"—and he produced another paper—"I should judge that the packet beside Madame is the one in question."

Laura's treasure—her sheet anchor—her last hope! No. She steadily refused compliance, and the stranger, with slight attempt to change her resolve, bowed and departed. On went the vessel, and Laura held her treasure fast when she wistfully gazed on the white cliffs of England.

(*To be continued.*)

THE WORTHIES OF TWICKENHAM.

We know of no place in the United Kingdom, the metropolis excepted, in which there have resided such a number of distinguished persons as Twickenham. We can trace amongst its former inhabitants statesmen, poets, philosophers, painters, authors, ecclesiastics, military and naval men, as well as many women of historical eminence. In the lapse of years it would become difficult to point out the residences and characteristics of these Twickenham worthies, and therefore it is thought that short notices of them would not be found uninteresting as a literary record. It should be stated that Whitton, being a hamlet of Twickenham, such celebrated persons as have resided in that place will be included in the list now about to be given.

Let us begin with Pope and his villa, of which now, alas! but little is left. Here Pope resided with his father and mother about the year 1715. His garden, lawns, and pleasure-grounds consisted of five acres. Horace Walpole tells us in one of his letters that this space Pope twisted, and twirled, and rhymed, and harmonised till it appeared two or three sweet little lawns opening and showing beyond one another, and the whole surrounded with thick impenetrable woods. Here was his grotto, his willow, and the beauteous Thames, on which Pope delighted to be *punted* on fine days. At Pope's death, his villa and grounds were sold to Sir William Stanhope, who hacked and hewed the trees, added to and spoilt the house, and desecrated the whole place. His friend, Lord Nugent, wrote the following sycophantic lines to him on what he called his *improvements* of Pope's grounds:

> And fancy now displays a fairer scope,
> And Stanhope's plans unfold the soul of Pope.

Should we not rather read—

> And Stanhope's wealth destroys the taste of Pope?

Not far from Pope's villa was the lath-and-plaster house built by Horace Walpole in a charming situation, which he called Strawberry Hill. He himself has sufficiently described it in his letters, with its outside appearance and its internal decorations. Here was his printing-press, and here he wrote those letters which will be read probably as long as the English language lasts. At the end of a verdant meadow Walpole purchased a comparatively small house, in which the celebrated Kitty Clive, the actress, resided. He would trip across that field accompanied by his pet spaniel, in order to enjoy the society of that fascinating woman. At his death he left the house to the two beautiful sisters, the Misses Berry, who may be reckoned amongst the Twickenham worthies.

Near to Pope's villa was the residence of Thomas Hudson, an eminent portrait painter, and who married the daughter of Richardson, the painter. Hudson had for his pupils Sir Joshua Reynolds, Mr. Mortimer, Wright of Derby, and many other celebrated painters, who first studied under him.

The extravagant Philip Duke of Wharton, whom Pope satirised as "the scorn and wonder of the age," had a house at Twickenham, pulled down a few years ago. A solitary cedar marks the spot, with a pond near it. A life of him, with his poems, speeches, and letters, was published in two volumes, after his death. He died in 1731, in a convent at Tarragona in Spain.

Lady Mary Wortley Montague lived in a house on the left-hand side of the road leading to Twickenham Common; it may still be known by two finely-carved stone vases on each side of the gateway. At one time she lived on terms of great intimacy and friendship with Pope; but they quarrelled, and hated each other cordially for the rest of their lives. She died in 1762. She deserves the gratitude of her country for having introduced inoculation into it.

That charming actress, Mrs. Pritchard, resided at a small house near the Thames, called Ragman's Castle, and so called from its having been an alehouse and the great resort of beggars. She enlarged it considerably. At her death, in 1758, it became the residence of George Hardinge, Esq., who had been Attorney-General to Queen Charlotte, and afterwards a Welsh judge. Mr. Justice Hardinge was a man of learning, a good lawyer, and of infinite pleasantry and wit. He wrote a series of letters to Burke on his impeachment of Hastings, and many other works. He was the father of that brave Captain Hardinge who lost his life and his ship in fighting an American frigate of far superior force. Mr. Justice Hardinge died in 1816, and his speeches at the bar and in the House of Commons, with his miscellaneous works, and a life of him, have been collected and published.

Close to Ragman's Castle is that fine villa now called Orleans House, from the late King of the French, Louis Philippe, having lived in it when Duke of Orleans. It was built in the reign of Queen Anne by Mr. Secretary Johnstone,* a man whom Pope satirised most bitterly. At his death it was purchased by George Pitt, Esq., better known by the name of Diamond Pitt. It is now the residence of the Duke d'Aumale. This reminds us of the following anecdote. When Louis Philippe was staying at the Star and Garter, Richmond, he walked one day by himself to Twickenham for the purpose, as he said, of seeing

* See Once a Week, vol. iii. p. 110.

some of the old tradesmen who had served him when he resided there. As he passed along that place a man met him, pulled off his hat, and hoped His Royal Highness was well.

"What's your name?" inquired the ex-king. He was told it. "I do not recollect it," said the king. "What were you when I lived here?"

"Please your Royal Highness," replied the man, "*I kept the Crown*," an ale-house close to the entrance of Orleans House.

"Did you?" said Louis Philippe. "Why, my good fellow, you did what I was unable to do."

In the upper part of Twickenham, towards Isleworth, there was a very ancient mansion, formerly the residence of Dr. Corbet, Bishop of Norwich in 1635. Adjoining is a house in which lived Sir Richard Perrin, one of the Barons of the Court of Exchequer, and close to it another in which the Duke of Montrose lived in 1797.

We now approach the hamlet of Whitton. In a conspicuous situation is Kneller Hall, built by and the residence of the celebrated portrait painter, Sir Godfrey Kneller. It is said that he painted so fine a full-length picture of Lady Kneller, that leaving the door of his studio open, Lady Kneller's favourite spaniel got access to it, and seeing, as he thought, his beloved mistress, he jumped up at her likeness and injured the picture, which had been taken from the easel and placed against the wall. The staircase in this fine mansion was painted by Leguerre.

In this hamlet resided Sir William Chambers, whose name will be remembered as long as Somerset House exists. His house was built by Archibald, Duke of Argyle, Effie Deans' duke, who resided here and planted those noble cedars, which are still the admiration of all who see them.

On approaching Twickenham Common, a very pleasing locality, may be seen the house formerly occupied by General Gunning, brother to those celebrated beauties, the Duchesses of Hamilton and Argyle, and Lady Coventry. The Marchioness of Tweeddale resided in it before General Gunning.

Near Twickenham church is a house formerly called York Place, once the residence of the great Lord Chancellor Clarendon. He tells us that when he attended the king (Charles II.) at Hampton Court, he came home every night to his house at Twickenham. This house, from its name, was probably once the residence of James, Duke of York, afterwards James II., as his two daughters, Mary and Anne, afterwards Queens of England, were nursed in it. When he married Lord Clarendon's daughter, he is supposed to have resigned the house in favour of his father-in-law.

On the north side of Twickenham church is a house which stood on the site of one to which Queen Katherine of Arragon retired after she was divorced from Henry VIII. A part of this house is still remaining.

Robert Boyle, the celebrated philosopher, at one period of his life lived at Twickenham; but the locality has not been ascertained. He was the fifth son of the great Earl of Cork, and died in 1691.

Henry Fielding, the author of "Tom Jones," &c., also resided at Twickenham. He died at Lisbon in 1754.

John Donne, the poet, was also an inhabitant of that place. He has been immortalised by Izaac Walton. He died in 1631.

Paul Whitehead, the poet, purchased a villa at Twickenham, where he died in 1774.

But we must not omit to mention amongst the celebrated persons who have resided at Twickenham the Lady Augusta Murray, the unhappy wife of the late Duke of Sussex, and the mother of his two accomplished children. That she supposed her marriage with the duke was a legal, although a clandestine one, cannot be doubted. Well might she exclaim:—

Malus clandestinus est amor, damnum est merum.

That learned divine, the Rev. Dr. Waterland, was vicar of Twickenham. He was the author of many works, and died in 1748. He had for his curate during many years the Jeremiah Seed, whose sermons and other works are still well known. He died in 1747.

Another celebrated vicar of Twickenham was the Rev. George Costard. He wrote and published several works on astronomy, and contributed to the Transactions of the Royal Society, of which he was a member.

We must now notice a house which belonged to Walter, Earl of Essex, the great favourite of Queen Elizabeth. He made a present of it to the famous Sir Francis Bacon, Lord Verulam, and Lord Chancellor, during whose disgrace it was sold. He resided much here, and entertained Queen Elizabeth in it.

Marble Hill, a delightful villa on the banks of the Thames, was built by the Countess of Suffolk, Philip Earl of Pembroke being her architect, and the gardens were laid out and planted by the hands of no less a personage than Alexander Pope. Although Lady Suffolk was celebrated as the mistress of George II., she was gentle and engaging in her manners, and much beloved by all who knew her. Horace Walpole, who lived on terms of great intimacy with her in her later years, says that "her mental qualifications were by no means shining—her eyes and countenance showed her character, which was grave and mild. Her strict love of truth, and her accurate memory, were always in unison. She was discreet without being reserved, and having no bad qualities, and being constant to her connections, she preserved no common respect to the end of her life, and from the propriety and decency of her behaviour, was always treated as if her virtue had never been questioned." Her letters to and from her correspondents, which have been published, prove how much she was respected and beloved. Lady Suffolk died at Marble Hill in 1767, in her 80th year. General Peel, the late Secretary at War, now occupies that place. Mrs. Fitzherbert formerly lived in it.

Richard Owen Cambridge had a beautiful villa on the banks of the Thames, near Marble Hill. He must be well known to the readers of Boswell's Life of Johnson as a man of literary eminence. Here he entertained Sir Joshua Reynolds, Beauclerk, Dr. Johnson, and other members of the literary club.

But it is time to conclude. We might, how-

ever, multiply our list of Twickenham worthies to a great extent, by means of the parish register and the numerous monuments in the church and the churchyard, but we could not point out their residences, which it was one of our objects to do. We will give an inscription on one monument, because of its pleasing literary associations.

To the memory of Mary Beach, who died November the 5th, 1725, aged 78,—Alexander Pope, whom she nursed in his infancy, and constantly attended for thirty-eight years, in gratitude to a faithful old servant, erected this stone.

Edward Jesse.

TARTARS AND TAEPINGS.

A PERSONAL NARRATIVE OF THE RECENT EXPEDITION UP THE YANGTZE KIANG.

The recent expedition up the great river of China, undertaken for mercantile as well as for political objects, promises to be fruitful of great results. We have received from an officer of that expedition the following narrative, which contains information that we think will be new as well as interesting to our readers. On the controversy now going on in this country, respecting the character and conduct of the insurgents, this record will be found to give infermation all the more trustworthy, as the author writes only of what he saw, and has evidently no foregone conclusion to support. It is only necessary to add, in order to understand some of the allusions, that the writer was also with Lord Elgin's expedition up the river two years ago.

"We left Woosung the 12th of February—we, on board the Cowper, going on first as pilot, followed by the Coromandel (with the admiral on board, and bearing his flag), the Centaur, the Atalanta, and the Waterman, and the gun-boats —the Bouncer, Havoc, and Banterer—following behind. The river at this the starting point was about the most dangerous part of the whole trip, being about ten miles broad, and the banks so low that there are no marks to steer by. The breadth of the river makes the stream very shallow—strewed with sand-banks and shoals — which we found out to our cost, for we had not gone on many hours before the Centaur, our largest ship, got fast aground; and after spending the rest of that day, and all the next in vain attempts to get her off, we left her till she should float at the next spring-tides, while we proceeded on to Nankin. So, on the morning of the 15th, we made a fresh start; but, one after another of the vessels got aground (coming off again easily however), so that our progress was slow indeed; and the very next day we, though the pilot-boat, got completely jammed on a bank, and, to make matters worse, it was at the height of the flood, and there we stuck for eight days, as we also had to wait for the spring-tides. The admiral, in the mean time, proceeded to Nankin to make arrangements for the Centaur stopping there, while we in the Cowper enjoyed ourselves as we best could, going on shore, shooting, walking, and boating. The country was a dead flat, and fearfully muddy; but thickly studded with villages and comfortable-looking farm-houses, built entirely of mud from the river. The soil was highly cultivated —not a spot of waste to be seen—and the people seemed happy and contented. They had their troubles, however, for the rebels were, or had been, expected, and a very small attempt at defence was made in the shape of a line of fortification along the bank of the river, which looked very well at a distance, but, on examination, would not stand a kick, being nothing more than turf loosely piled up. The mouths of several creeks were staked so that junks could neither go up nor down; and here and there we found a small military fort consisting usually of twenty men, but wretchedly armed and apparently fit for nothing else than to run away. The people were very civil, and stood and looked at us without fear.

"On the 23rd, the Coromandel joined us with the rest of the fleet; the Centaur having also got off, and accompanied by the Snake, which left Woosung after us, and by good-luck or good management we got off the next day (the 24th). The admiral had been to Nankin, and made all necessary arrangements for the passage of the squadron, and the stopping there of the Centaur. Captain Ward of the Actæon (who accompanied the expedition), had been some distance up the grand canal, which he describes as in a most ruinous condition, and likely it is to remain so; for the one end of it is close to Nankin, the stronghold of the rebels, while the other rests in the capital of the emperor, so that this grand undertaking, going direct from Pekin to Nankin, or rather to the Yangtze, which river runs for more than a thousand miles into the very heart of the country, is rendered through these troubles completely useless, and falling gradually into decay,—a fit emblem of Chinese government.

"On the 24th, as I said, which was a Sunday, we got off, after which we lay quietly at our anchors, for Admiral Hope permits nothing to be done on that day which can be left alone; and the mercantile gentlemen of the party had the mortification of seeing an American merchant steamer—the Yangtze—pass us on her voyage up the river. She belongs to the great house of Dent & Co., who, I suppose, sent her up to get all the news in anticipation of our return, and, at the same time, do a stroke of trade in opium; but as she did not stop or communicate with us in any way, we could only guess at her objects. The next day we spent adjusting the general stock of coals, preparatory to sending the Wanderer back to Shanghai, as she was found to be only a drag on the rest of the squadron, on account of her slow speed. Next morning we made a fresh start, proceeding through a flat alluvial country, every foot of which is cultivated. The second day the appearance of the land rather improved, the country was more hilly and the river narrower, so that we could plainly see the peasantry at their daily labours. In the afternoon we passed Silver Island—a striking object, being a precipitous rock in the middle of the stream, covered to the summit with trees. It did not, however, present the same beautiful appearance as when I saw it two years ago, as the trees were now bare of their leaves. The country here is quite hilly, full of large villages, and no end of fortifications. Just above the island is

Chin-Kiang, situated between two high hills, and surrounded with a wall. On one of the hills we saw the flag of our Consul, which had just been hoisted. This is the place where it is intended that all trading vessels shall show their papers and pay the Customs' dues. The town is little better than a ruin, having been destroyed several times by the rebels, and as often given up. As they retire the Imperialists take possession, and the town begins to recover a little, on which the rebels again attack, for the sake of the plunder. Its chief importance was derived from the grand canal, which comes out upon the river just opposite the town, but which, as I said before, is now useless. Here we found at anchor a portion of the Imperial fleet gaily dressed with flags. Besides the junks, there was what had once been a little coasting-schooner, but now turned into a Chinese man-of-war, and mounting twenty-one guns.

"After leaving Chin-Kiang the country again becomes a dead level, the river broadens, and nothing is to be seen but the tops of high mountains far inland, the ranges running parallel with the course of the river. As we neared Nankin, which we reached the next day (the 28th), the country again became hilly; one of the hills is enclosed within the walls of the city, and is used as a look-out. The city itself lies about three miles back from the river, so that it is impossible for ships—at least, with the range of guns we carry—to bombard it. The river is besides pretty strongly fortified with gun-batteries and other earth-works, which we had good opportunities of viewing when a party of us went ashore. Our object, indeed, was to get into the city; but we found that we must first get a pass, which took up so much time that we had to give up the visit for that day, and we spent our time in rambling about the neighbourhood. Having got inside a rude kind of a wall which surrounds the river fortifications, we found ourselves in what had, at one time, been the suburbs, but now were in a shocking state of dilapidation, having been all knocked down and only partially and temporarily built up again. We hunted up one of the head men of the place, and at last came across a rather dirty gentleman, dressed in a long yellow robe, with a head-dress composed of tinselled paper, with a dragon stuck on each side of a piece of looking-glass, and behind the looking-glass was a tiger standing tail on end, the whole set off with a few beads, and in shape something like a bishop's mitre, though a more trumpery affair could not be seen in a penny gaff in Lambeth. This "swell" took us to his house, treating us to tea, and, after a long conversation with the interpreter, we obtained a pass for ten for the following day. We then got clear of the suburbs, and on to the hills, where we had a view of the lines that the Imperial army threw up while besieging the city a year or two ago. At that time they nearly took the place, as they completely invested the city and the people were starving. But the rebels communicated with their friends outside, who collected a great force, and, at a given signal, the Imperialists were attacked, front and rear, and driven off with great slaughter. I should tell you that the length of their investing wall measures twenty-five miles, so that you may have some idea of the labour the Imperialists had in besieging the city; it runs over hills and through valleys, and is flanked at the distance of every half-mile or so with earthworks, ditches, pitfalls, &c. &c.

"The next day a large party went through the city, accompanied by Mr. Muirhead, a missionary, who has a high character out here. I was unfortunately detained on board by business, but I heard the news from the others, particularly the religious professions of the rebels, the principal of which seems to be that there is one chief ruling Spirit in Heaven and another on earth. The earthly one is no less a personage than the present ruler of the rebels, Chin-Wang, who lives in a kind of sacred state at Nankin, being seen by no men, but entirely surrounded and waited on by women, of whom he is said to have at least 500 in his seraglio. It seems to be the rule in these wars that the young women and girls are spared, and the boys are taken to be trained as soldiers, while all the men, the old and ugly women, and the young children are butchered without mercy. This same Chin-Wang was at one time a pupil in a school at Hong Kong under a Mr. Roberts, who, hearing of the position his old pupil had attained to, paid him a visit, and was well received. In fact, Roberts has been here now several years, only Chin-Wang told him that now he must be his pupil, learn his doctrines, and then go and teach them to his brethren. Those who were inside the city described it as an awful ruin, not a twentieth part of the old houses standing. The Tartar city was enclosed within the general wall, but it had also very strong fortifications of its own, though, with all its strength, it could not resist the assault of the rebels, who massacred the whole population, men, women, and children. The palaces of the king and chief are the only respectable buildings now inside the walls. The population of the entire city is now said to be about 50,000; every one is registered, and put under some board to work, for which they receive nothing but their food, and not too much of that. Mr. Muirhead stated that it was quite a mistake to think the rebels wanted missionaries; the fact is, they want to convert the missionaries to their own monstrous doctrines.

"March the 2nd. We left Nankin, and proceeded through a flat and uninteresting country, and in the afternoon arrived off Wo-hu. Like Nankin, the city proper lies back about two miles from the suburbs that line the river. In the afternoon of the next day a party of us went ashore, and had a long walk over heaps of bricks that had once been streets and houses, but the rebels having taken it, the usual devastation followed. We were conducted all over the place by two sturdy, athletic rebel soldiers, and a more desolate, ruinous state of things it is impossible to conceive. The people were, without exception, in rags, and I did not see one decent shop in the city. The walls, which were falling rapidly into decay, had once been very grand, as was evident by the carved work that still remained over the gates. We calculated from a rising ground that the city and suburbs together must have once covered some seven or

eight miles square, but only a very small portion of that is now occupied. We visited one of their mandarins, and to reach his house had to climb a hill, which I can only compare to a high dunghill. Up one side we went and down the other, being in great danger of slipping and falling at every step—and if we had, what a mess we should have been in ! One of the merchants of our party had a short talk with the mandarin on business. He was a fine energetic man of about twenty-five. He treated us very kindly, giving us the usual Chinese welcome of a cup of tea. Peeping from behind a screen, I saw two or three pretty-looking girls, I suppose his wives, for they have unlimited quantities of that commodity. The river here, 260 miles from the sea, is considerably broader than the Thames at Greenwich. On the bank of the river close to the town, and under the eyes of hundreds of the inhabitants, was to be seen the disgusting spectacle of dogs devouring a human body. The next day we proceeded up the river, passing alternately fleets of the rebels and Imperialists, who must surely have some understanding with each other, as you meet with them frequently within ten miles of each other, yet they never fight. We passed the city of Ngankin, which you may remember had the impertinence to fire at us on our voyage up the river in 1858. It is still in the hands of the rebels, though the Imperialists have completely surrounded them with their lines of circumvallation, and are making their gradual approaches to the city in a series of zig-zags. Not that either party appear to hurry over their work, as, while we passed, one gun about every ten minutes was the average of the firing. The city itself looked in good repair. At the angles of the walls stakes had been driven into the ground in immense quantities. Outside the wall was a beautiful pagoda, strongly fortified, quite surrounded with spikes and *chevaux de frise*: and outside of the city were the usual ruins of suburbs, almost as large as the city itself. I suppose they were considered indefensible, and so they destroyed them. This siege has now been going on to our knowledge for two years, and goodness knows how much longer it may continue. The country for miles round, indeed as far as we could see, looked quite uninhabited, evidently in consequence of the war ; except that at places we passed on the river we saw crowds of people that seemed to have been driven from their homes, and living in temporary huts of straw. The next day, the 5th, we passed a large walled city, Tu-ngliu, in the hands of the Imperialists, who, to make sure of keeping it, have a large army stationed round it. It presented quite a gay appearance as we passed ; banners past all numeration were waving in the sun, every other soldier had one ; if they had fewer banners and more guns it would perhaps be better for the poor people. Farther on we passed a remarkable conical rock in the middle of the river called "Little Orphan," on the extreme top of which was placed a joss-house, and on a narrow shelf midway up another temple ; how ever the people get to it we could not see. At this place the river is remarkably narrow, not more than three-eighths of a mile in width, running rapidly through a gorge between two high mountains. We anchored at dark off the entrance to the Po-yang lakes, and in the morning we found the scenery was grander than ever, hill rising behind hill, till they towered up into mountains, the back ground filled in with a lofty range whose peaks were covered with snow. Here there is a military town called Ho-kow, surrounded with a strong and good wall. This at one time belonged to the rebels, but they left it when the Imperialists took possession. There were only 1000 men of the Imperialist army here, and awful looking wretches they were, the lowest of the low. No wonder they always run away when the rebels approach, for these latter, to do them justice, have the look of men about them.

"Next morning we left Ho-kow, leaving behind the Atalanta and Havoc to survey the lakes. We soon reached Kewkeang, a large and populous city, walled, though not in good repair.

"The country here is evidently more settled and better cultivated, being more out of the reach of the rebels. I was unable to go ashore, but by all accounts the city was like all other Chinese cities, very dirty, though evidently flourishing. Next morning we left, and passed through a beautiful district, the river making many windings among the hills : the valleys were well cultivated, and densely populated villages, pagodas, and towns crowding on the eye. In the evening we anchored off the town of Wang-chow-ho, where we stayed next day, being Sunday. On the other side of the river is another large town, though Wang-chow is the capital of the province. After divine service a party of us went to the opposite town, as the country looked more inviting, and had a pleasant ramble, though we saw nothing remarkable. We were treated by the people with great civility, which was not the case with another party that went ashore at Wang-chow. The people were very insulting, and threw several brickbats at them. They went to complain to the chief mandarin, who made them a humble apology, the substance of which was, that the great literary examination was going on in the town, and that all the "roughs" of the province had collected in consequence. He led them out of the town himself, the crowd following, and occasionally hooting ; and directly he got them outside the gates were shut on the rabble. A word about these examinations. They are held in the capital of the province every three years (I think), for degrees or rather places in the government. The hall in this town is said to accommodate 8000 pupils, each of whom has a separate cell, and all the cells look out into the court-yard, so that though the pupils cannot communicate with any one outside, or with each other, they can be plainly seen by the officers in the court-yard. Well, in these cells they are kept writing the essays, which are not given out till they are all assembled inside, and for three days, while they are writing the essays, they are not allowed to leave their cells on any pretence whatever. I am sure I don't know whom to pity most—the pupils, or the examiners who have to read the thousands of essays all on the same subject.

"Monday, the 11th. We steamed along through a highly populous country, till in the afternoon we

arrived at Han-kow, the termination of our voyage, having been exactly four weeks on the passage. We here met with just such another crowd of boats round us as we had two years before. We found the town in a flourishing condition, much more built up than when I saw it before. The mandarins and people were remarkably civil, and I had several pleasant walks through the towns of Han-kow and Han-yan, which is a large walled city on the other side of the river, and the capital of the province. The walls round this city are extremely thick, and are said to be twenty miles round, though I think that an exaggeration. They enclose, however, a considerable quantity of cultivated ground, and a ridge of hill that runs right across the city. Here we could not move without having three or four soldiers following us to keep the crowd off. There is nothing particular in either of these cities, unless it be a tunnel the people of Han-yan have bored through the ridge I spoke of, from one side of the town to the other. While we were going through we happened to meet the viceroy in state, with a guard of Tartar horse, armed with their six-feet bows; fine, tall, strapping fellows they were too. After the guard followed executioners (horribly ugly fellows), and a "tail" longer than a Highland chieftain's, all wearing gaudy silk dresses ornamented with tinsel.

"On the 13th the admiral decided on going in the Coromandel farther up the river, and agreed to give the gentlemen composing the overland expedition to India a tow up in the junk they had hired as far as he went. The evening before, their fellow journeyers so far gave them a farewell dinner on board the Cowper, which was going off very pleasantly indeed; but while our enjoyment was at its height, and the champagne corks flying freely, we were roused by the cry of "A man overboard," and though every exertion was made, the poor fellow was carried down by the current and lost; he bore the character of a very steady young man. The next morning the expedition started in tow of the admiral, and we rather astonished the Chinese by the cheers we sent after them. The admiral was only five days away, during which time they had ascended 150 miles up the river beyond Han-kow, without any difficulty whatever, the river still continuing as broad and deep as at the town, so that it is quite impossible to say how far ships may ascend. The country up the river was flat and highly cultivated. During the admiral's absence we enjoyed ourselves in fine style, looking about us, and watching the immense trade and traffic of all descriptions that was everywhere carried on. But four-and-twenty hours put a stop to it all. One day, a report was raised that the rebels had taken the city of Wang-chow, where the examinations were going on as we passed it, and that they were marching on Han-kow. Immediately trade was at a stand-still; everyone began packing up; scarcely a shop was to be seen open; and those that were had all in readiness for their occupiers running off. I was on shore the day after the report, and could scarcely believe that I was in the same place. Men, women, and children, loaded with seemingly the first things that came to hand, were rushing out of the town. The scene that presented itself to our view it is impossible to describe. Outside of the city a flat level country was covered, as far as the eye could see, with crowds of people, getting away as hard as they were able; and towards evening the panic became positively frightful. As a party of us were coming along the principal street, trying to stem the torrent that rushed madly past us, one Chinaman who was coming along with the rest, as soon as he saw us, fell on his knees, caught hold of one of our party, whom it seems he had formerly known in Shanghai, and entreated us to go with him to his office; and there he went down on his knees again and seemed to think that now he had got hold of us he was safe. This Chinaman was a banker, and had been deserted by all his clerks and servants, who, hearing the alarm, had rushed out of the office, leaving all their employer's capital exposed, amounting to as much silver as four men could carry, and something like two or three tons of copper cash. We had his silver removed to a place of safety; as for the copper cash the owner was indifferent to it, and seemed to think that neither thieves nor rebels would meddle with it on account of its weight. While thousands were thus escaping by land, thousands more were escaping by the river in junks of every size and shape, from the little ferry-boat into which were crowded fathers and mothers, perhaps grandfathers and grandmothers,—six or seven children, two or three pigs, and a heap of household furniture,—to the large-sized river-junks that seemed to be carrying forty or fifty families. Both the river and its tributary, the Han, were perfectly alive with boats and junks, the passengers having only one object in view—escape from the rebels. I was particularly struck with the passive look of helpless misery in the countenances of the fugitives—no tears, no lamentations; they seemed to take it as a decree of fate, against which resistance and complaint were alike hopeless. As you may be aware, the town has been destroyed two or three times by these blackguards, and each time with great slaughter of the defenceless inhabitants. It is quite unprotected, having no walls, as it is not considered a city by the Chinese, but only as a mart of trade, where the merchants meet to transact business, but consider some other place as their home. It was calculated that of all the people we saw running away at least 10,000 would die of starvation before a month was out.

"We afterwards found it to be quite true that the rebels had taken Wang-chow, and in the simplest possible manner. A hundred men passed through the investing lines at Ngankin, and shaving their heads (for the rebels distinguish themselves from the Imperialists by wearing all their hair), and dressing themselves up as Imperialist soldiers, they entered the town without suspicion, and early next morning opened the gates to their comrades, and the town fell without a struggle. One of the officials at Han-kow being asked what he thought of all these troubles, his answer was to the effect that Providence every ten years sends some minor calamity, such as famine, or inundation; but that every two hundred years some universal calamity takes place, and as the Tartar dynasty has now

been established two hundred years, after overthrowing the Ming, or native Chinese dynasty, who knows but that we are about to have another dynasty? But I find I must curb my recollections, or I shall never finish this letter.

"We left Han-kow on the 18th of March, and proceeded rapidly down with the stream, only delayed at Ho-kow by losing two of our anchors, and spending nearly two days fishing for them, and after all we only found one of them. I went ashore, and had a pleasant but rather tiring walk, climbing to the top of a high hill to get a view of the Poyang Lake; and it certainly was worth the trouble. The hills are bare and sterile, but the valleys present a great contrast, being quite beautiful, and covered with the most luxuriant vegetation. I managed to get a view of the lakes which run up the country to a great extent. The ships left for survey had not been able to do much during our absence. The water was too shallow, and the work must be left to the rainy season. On the 25th we got back to Nankin; and here I had an opportunity to visit the far-famed Porcelain Tower. Our way lay between the walls of the city on one side, and a creek of the river on the other. The wall was at least forty feet thick, of solid stone and brickwork. We tried to enter one of the gates, but were turned back, not having a pass. All round there were remains of what had once been extensive suburbs, but were now only heaps of bricks. Other remains there were, by no means pleasant, in the shape of human bones, lying about. I saw no less than four almost perfect skeletons; and at two gates we passed were crowds of the most wretched human beings I ever saw—loathsome and disgusting—that almost made me faint to see them. At last we reached the Porcelain Tower, or rather, I am sorry to say, its ruins. It is still, however, a pile of forty feet high, built of common brick, and faced with porcelain three inches thick, supported inside with iron ribs; we saw segments of the circles of iron still there. Much of the porcelain lay strewed on the ground. We, of course, loaded ourselves with the best pieces we could find, and I hope some day to show you what nearly broke my back carrying down. Some others of the party, expecting to get a boat, hired Chinamen to carry their loads for them; but, being disappointed in getting one as soon as they expected, the Chinamen struck work, dropped their load, and ran off, so the gentlemen had to pick up the finest of the specimens, and let the rest go. Fortunately, about half-way back, we did manage to get a boat, or I should certainly have dropped the half if not the whole of mine.

"Next day I joined the same party to visit the tombs of the Mings, or old Chinese emperors, and had a most delightful walk in an opposite direction to our excursion of the day before: we had a walk of eight miles between the city walls and the deserted Imperialist lines I mentioned before. From some of the hills we had to cross I got a capital view of the city itself. As I before told you, the principal part is a ruin—certainly more than the principal part. The Tartar city inside is a complete desolation (the rebels are always down on the Tartars, and never spare man, woman, or child of the race when in their power). At some places I found traces of the struggle that had taken place by the number of cannon balls strewing the ground. At the top of the last hill we came in sight of colossal group of animals that form the avenue to the tombs. These figures are double the size of life, carved out of the solid stone. First there are two horses, one opposite the other; then two sitting opposite each other; then four tigers, in the same position as the horses; then four lions, ditto; then four elephants, and last, four dromedaries. This avenue led to a square building, in which was a colossal tortoise, on the back of which was placed a tomb-stone, 30 feet high, inscribed all over with Chinese characters. At right angles from the entrance of the avenue was another avenue, bordered not like the other with animals, but with groups of warriors and priests. This led to an enormous building, but in such a ruinous condition that we could neither make top nor tail of it. That it had at one time been very magnificent was evident by the painted tiles that lay strewed around, the paint of which even now looked quite fresh. There were the remains of a grand gate leading to a vast temple. Then the temple itself was completely in ruins. Part of the terrace only remained leading to a wide bridge, which again led to an enormous pile of square building, having a tunnel through it, which, being on an incline, brought us out on the top, some fifty or sixty feet from the ground, and double that in area. It would require diagrams to give you an adequate idea of the extent and vastness of the whole affair. The stone sculptures were skilfully done, but with an utter want of taste and grace; the animals were heavy and without life in them: and as for the elephants, the ones that were kneeling had their legs turned out instead of inwards, giving them a very odd appearance. The Imperialist lines I mentioned before had gone right through these tunnels, which accounts for the desolation in which we found them, for mere age would not have so destroyed them, though they evidently are of a very high antiquity. The Chinese cannot have the bump of veneration, or they would never have allowed these interesting relics of a past age to be so destroyed. I brought back a few painted tiles from these ruins also, and never did I feel so tired as in carrying them; the weight got heavier every mile, and even now my shoulders ache with the effects of the load.

"We left Nankin on the 28th of March, thoroughly disgusted with the rebels. There was nothing to be had from them, or what they had was frightfully dear; but the fact I believe is, that the poor wretches themselves are almost starving. We arrived at Shanghai on the evening of the next day, and so finished our cruise, of which I have only to say that I thoroughly enjoyed it."

SOUVENIRS.

I loved a lady fair of face,
  A witching girl who made me wise;
I was a city drone, but Grace
  Made me a poet with her eyes;

For Grace was sweet as sweet could be—
To me, at least, divinely fair :
And I believe I loved her—See !
This little curl of golden hair.

This curl upon her brow has gleamed
Beneath the sun's alchemic touch ;
But I, who stole it, little dream'd
That it could ever mean so much :
It summons back her lovely look,
The brow alive with thoughts untold,
The blushing laughter, when she shook
The sunshine from her locks of gold.

We played a little pleasing game,
A playful love, we knew not why :
I made acrostics on her name,
But came to kisses by-and-by.
This sleeping Cupid, red as wine,—
A quiver here, a spire beyond,—
She sent me as a Valentine,
And it reminds me we were fond.

And here,—a book of tender rhymes
That (for a wonder) time has kept:
I read it out a hundred times,
And marked some portions, where we wept:
A foolish volume it may be,
Yet o'er it she has laughed and grieved—
It says, we were so young, that we
Conferred the beauty we perceived.

Well, time passed on. Within, without,
My brain was hot, my face was fired ;
We played our pretty folly out,
Till I grew bold and she grew tired;
Till I grew bold and she grew cold,
Forgetful what the years might bring—
We quarrelled, she not loath. Behold
This tiny, tarnish'd golden ring.

I bought the ring unknown to Grace,
A golden ring my love to crown,
And often, looking on her face,
Dreamed of a cottage out of town,—
A little garden, deaf to fame ;
Till, blind with projects small and big,
Sure of its object, Love became
A gross ambition for a gig !

O, common folly, short and proud !
We quarrelled, parted, turning backs—
The gig came never from its cloud,
The cottage never felt a tax.
I bade, while brow and bosom burned,
A bitter truce to all my joys ;
She married (well, they say), and learned
The knack of rearing girls and boys.

I keep the tokens I have shown,
And hold them very dear, in truth,—
Not for the single loss, I own,
But for the general loss of youth ;
Love dies, but memories renew
The heart whose crust is hard and cold :
Romeo is young at forty-two,
And Juliet can ne'er be old !

R. W. Buchanan.

"PRAY, SIR, ARE YOU A GENTLEMAN?"

On the 23rd of March, 1860, I went to London for a couple of days on business.

Turning the corner of Chancery Lane, I unexpectedly encountered my friend Frank Stonhouse. I call him my friend, though there was a disparity in our ages,—he being forty-five, I thirty years old. He, moreover, was a married man with a family ; I an itinerant animal, without encumbrances, called a bachelor. Still we were very much attached to each other. After an exclamation of surprise and pleasure, Frank rapidly said, "I am very busy now, but you must come and dine with me to-day at seven o'clock."

"Very well," replied I, and we parted.

As my tale will, I fear, be a long one, I must not be prolix at starting, especially as this is but a kind of preface. So fancy, good reader, dinner over—ladies gone to the drawing-room—a most luxurious dessert on the table, and some Madeira.

"Charles," said my friend Frank to me, "I have not opened fresh port for you, because I fancy I recollect your partiality for Madeira ; but I will do so in a moment if you wish it."

"Oh no, thank you," replied I, "this is perfection in the shape of wine, and I assure you that owing to it I shall soon feel happier ; indeed, as happy as a prince, were it not for one thing which I cannot shake off."

"And what is that, Charles?" asked Frank.

"Why, the fact is, that about a month ago I was foolish enough to bind myself by a promise to write six tales. They must be finished by the 31st. I have only written three, and what on earth I am to say in the other three is more than I can imagine : now do help me, there's a good fellow, Frank, and then I shall have a load off my mind."

"Help you ! Not I. Why, you can get out of your predicament easily enough. Remember Truth is stranger than Fiction, and you who lived three years in London, and have been a fair average rover so far through life, can be at no loss for adventures in which you have borne a considerable share, and which, therefore, you can readily describe. Write about your London experience."

"Well, I would do so if I was writing for a periodical, but I am writing for friends who have often heard me repeat whatever was amusing in my London life that would bear narration." Now, do help me, Frank."

The Madeira was beginning to soften Frank's heart : I let it work.

"Charles," said he, after a time, "I will tell you a true tale concerning myself. No one has ever yet heard a word of it. Promise me faithfully not only that you will never reveal my name in connection with it, but that you will so disguise it as to render detection impossible ; and moreover, that you will never again, in conversation with me, allude to the subject."

I promised, wondering what was coming. Two or three times Frank stopped in the course of his story. With difficulty I induced him to continue. In fact, if I had not pretended to wish for another bottle of Madeira (of which I took care he should drink the greater part), I never should have elicited what I wanted. I knew full well that I should have a head-ache next morning, but I also knew that one head-ache and a good story from another person were to be preferred to the three head-aches I should probably get in composing a story myself. I was astonished at the following tale : of course parts of it came out in the shape

of question and answer, parts easily, parts on the contrary, in broken sentences. To avoid all that, I shall make my friend Frank Stonhouse appear to write the tale connectedly throughout. He as chief actor speaks in the first person. I vanish, good reader, entirely from the scene, and beg you to listen to Frank.

"Pray, sir, are you a gentleman?" What a strange question to be asked. It never but once before in my life was put to me, and then at school by a bigger boy than myself, whom I immediately knocked down—but coming from a young lady's lips what could it mean? What was I to answer? Be it known, then, that in the year 18—, I, a young man just called to the bar, had, in spite of the remonstrances of an angry porter, jumped into a first-class carriage of an express train starting from Reigate to London, when it was actually in motion. Seated alone in the carriage was a young lady, about nineteen years old; very pretty, light hair, blue eyes, &c. She was evidently in distress, and I fancied wished me elsewhere. After the lapse of a few moments the question was repeated by my fair interrogator—"Pray, sir, are you a gentleman?" I was about to answer in a bantering tone and manner, when it struck me that her voice had almost faltered as she spoke, and that whatever her motive was she was at any rate in earnest.

"Madam," I replied, "your question is a strange one, but I believe I may say I am a gentleman; still, if you will tell me what you mean

(See page 128.)

by a gentleman, I will answer you with greater certainty than at present I am able to do."

"Sir, my idea of a gentleman is that of one who not only will not take advantage of a lady in distress, but will assist her to the utmost of his power."

"Then, madam, I can assure you I am a gentleman."

"Then, sir, will you be kind enough to put your head out of the opposite window, and not look back till I call you."

I rose to obey, wondering what it could mean, and almost glancing at her to see if she were a robber in disguise. All that she had with her in the carriage was a large bundle.

"Stop, sir," said she, "it is perhaps but right that I should tell you this much. I am running away from my home near Reigate. It is a matter of worse than life and death with me. The train does not stop between Reigate and London, but I shall most infallibly be pursued by the electric telegraph, and detected at the terminus, unless I can contrive by disguising myself to deceive those who will search for me. I give you the word of a lady, that in doing what I am driven to do, I am not acting in any way wrongly,—more I cannot tell you."

She burst into tears, and after a hysterical sob or two, she said, pointing to the window, "And now, sir, will you be kind enough to prove yourself a gentleman, and accede to my request—I am going to change my dress."

I at once arose, and I can safely aver that the longest ten minutes I ever spent in my life were

occupied in gazing with head and shoulders out of the railway carriage on the surrounding scenery. So little, however, did my eyes or my brain take in what was before me, that I could not on my oath have stated whether we passed through a wilderness, green fields, towns, or the sea. At length I was told to look round. I did. Where could the lady have gone? Before me sat a tear-fully-laughing very juvenile middy—costume quite correct—hair short—cap jauntily set on the head. A mass of curls lay in the fair boy's lap.

"Thank you, sir," she said. "You will never fully know what a kindness you have rendered me, and probably we shall never meet again. For your name I will not ask, but if you will give me anything belonging to you to remind me of this hour, I shall be obliged."

I pulled out a small shilling likeness of myself destined for a young nephew of mine, and a lock of my hair, which was wrapped up with it. Without opening the parcel, I said, "Madam, that may serve to remind you hereafter of what certainly has been the strangest chapter in my hitherto not unvaried life."

She put the parcel in her waistcoat pocket, took a pearl ring off her finger and gave it to me, with a tress of her hair, saying, "Keep that, then, to recal to-day. In ten minutes we shall part for ever."

For a time both of us were silent. At last I said, "Madam, if you think that, alone as you are, and probably unaccustomed to London, you can escape the detectives at the station, you are mistaken. I could tell at a glance (to borrow a phrase from your profession) that you were sailing under false colours."

"Indeed," said she, somewhat startled; "well, if you will extend your kindness to seeing me clear of the station, I shall be still more than ever your debtor for life."

"Then there is no time to be lost, the train is slackening speed. Put both your delicate hands at once deep into the pockets of your monkey-jacket—they are not like those of a sailor. Lean back in a careless way; and wait, let me dirty your boots by treading on them. Now put one foot on the seat opposite to you; never mind the clean cushion; throw the other leg negligently over the arm by your side. Don't dream of speaking; I will talk, if necessary. Whistle, if you can, when we stop. Give me your ticket."

It was marked from Dover to London. Capital, thought I; wonder how she got it. Mine was a season-ticket.

"Tickets, sir, please."

I handed both. The middy whistled. The guard and policeman actually looked under the carriage-seats. A long time the train was delayed before it moved into the station. At length it did.

"Now, follow me," I said, "roll in your walk, if you can, mind you keep your hands in your pockets."

"Cab, sir?"

"Yes, now then, in with you, Jack."

"Where to, sir?"

"Hyde Park Corner." I thought I would name a distant place to give my friend breathing time. We moved forward a few paces, and then stopped.

"Now then, Cabby," said I. "What is the matter?"

"Why, sir, blowed if there ain't them perlice at the station gate, hexamining of every cab, and the parties hinside on 'em, and they be doing the same to those who be walking."

My companion turned deadly pale. I pulled out a flask of neat brandy. "Drink two mouthfuls,—down with it, gulp it down,—anything to give you colour."

At the same time I took out two cigars, lighted them, pushed one into my friend's mouth.

"Smoke," said I, "as hard as you can, your safety depends on it."

Two detectives looked in at the window. "Where from, sir?"

I blew a volume of smoke into the man's face, which caused him to rub his eyes and cough. (The middy was puffing literally like blazes).

"Where from?" replied I. "Why from Dover: what on earth do you want?"

Another discharge of smoke settled the matter.

"All right, sir, beg pardon."

I gave him a parting volley of smoke.

"Drive on cabman with the gentleman."

In another minute, after continuing from sheer habit to produce a hazy atmosphere, I looked round. The middy had fainted. No time yet for thinking, but acting. I used my flask again, then a vigorous pinch. By-and-bye the young gentleman came round.

"Well, now you are safe, at least from detection and pursuit, at any rate, for the present; where shall I tell the man to drive to?"

"I don't know; I wish you would tell me where I *can* go for two or three days, till I am able to mature my plans."

"Indeed, I cannot."

"Can you not recommend me to some safe, respectable woman who will not betray me, even though a large reward be offered."

I shook my head.

"Then, surely, you have some lady relations, or lady acquaintances in London, who will take pity on me, or (I had told her I was a barrister), you could conceal me till the end of the week in your chambers in the Temple."

"With regard to the last, you know not what you ask," I said. "Even if I were to give you the key of my chambers, and go into the country, not returning till you had left London, it certainly would come out some day, and then in the eyes of a censorious, wicked world, who judge others by themselves, your character would be irretrievably blasted and ruined, and mine not much improved, though that is of little consequence as I am a man, and society, thank Goodness, judges us very leniently, and yet it might be awkward, as I am engaged to be married. With regard to my lady acquaintances, I know many who would take pity on you, as you wish, if you would disclose all the facts of the case, but——"

"Oh! I cannot, will not, do that; I would die sooner. Do, *do* help me in my distress."

"Indeed, I do not see what is to be done."

I looked out of the little back window of the cab, stealthily. "Wait a bit," I said, "here is a fresh difficulty, listen to me speaking to the driver,

and be prepared to act accordingly." We both leaned forward. "Don't look round, cabman, put your hand back, there are two pounds for you as your fare. Take no notice of me whatever, but listen and obey my directions. We are followed, as I have ascertained by looking back several times, by a Hansom. Your number, I expect, is marked plain at the back of your cab?"

"Yes, sir."

"I thought as much. Well, in the Hansom sits a gentleman I wish to avoid (I knew him to be a detective, but did not choose to enlighten Cabby). I *must* avoid him."

"All right, sir. Come up old hoss." (Lash, lash.)

"No, no, that won't do, his horse is better, his cab runs lighter than yours. Now, attend. Just beyond that large van of Pickford's, which is standing still in the distance, there is a turn to the right which cabmen sometimes take when driving to Hyde Park Corner. It is moreover an unfrequented street. If I mistake not there is just room for you to get round inside the van. At any rate, you must try it. I will pay for any damage done. The Hansom being broader will be obliged to sweep round outside, and may be stopped a little by the stream of carriages."

"There is no room for me, sir, there."

"There is, you *must* try it. The moment you are round the corner, slacken your pace to a slow walk, and the instant you hear the door slam, drive on to Hyde Park Corner at your usual pace. Tell my following friend what you like when you get there. Now, there is another pound for you. Go at it hard—neck or nothing."

Cabby obeyed. A bump, a scrape, an oath, a "Now then, stoopid, where are you a driving to?" and we were in the smooth water of a quiet street. The pace slackened—we jumped out—I slammed the door—Cabby drove on. We vanished into a shop, and had the inexpressible pleasure of seeing the Hansom roll by, steadily trotting after its fast receding, supposed prey. All this took place in less time than any one would occupy in reading the last few lines. I purchased something in the shop, made the middy light a fresh cigar, and hailed the first cabman I met, telling him to drive to Notting Hill. Not a word had the middy spoken till now, when I heard—

"And so you *cannot* assist me, sir?"

"Not a bit more than I have done, and am now doing, I feel I am a match for any detectives, and can give them the slip as you have seen; but what to do at night in London with an unprotected young lady in gentleman's attire, passes my comprehension."

"Sir," she said, with animation, "did you, do you, for a moment doubt that I was speaking the truth, when I said that I was not acting wrongly?"

"On my word," replied I, "I did not, do not doubt you: at any rate, I am convinced that you honestly conceive that circumstances justify your taking the step you have taken."

"And you would agree with me," said she "if you knew them. Now we part, oblige me by giving me the names of three or four of the first chemists in town, and of three or four respectable married doctors."

"I will, if you will assure me that suicide is not what you are meditating."

"I give you my word that that is not the case. Circumstances may warrant my doing what I am doing; but cannot, in my opinion, justify any sane creature in precipitating himself uncalled for before his Almighty Father."

I gave her what she requested, and offered her money.

"No, thank you, I have plenty of that; and now, good-bye, sir. God bless you for your kindness to a persecuted, helpless, suffering, but not wicked girl."

She hysterically pressed my hand for a moment, then recovering herself, said:—"Stop the cab, please sir—get out—tell the man to drive on. May God bless you for your kindness."

I raised her not unwilling hand to my lips, and did as she directed. In another moment I stood alone in Oxford Street. Well, thought I, is it a dream? Am I a fool? No, it is no dream: you are no fool. You have to the best of your intention acted kindly. It is a mystery: you will never read it. I *will* though, said I, to my mind, and forthwith commenced walking to my chambers in the Temple.

Three Hundred Pounds Reward.—Whereas, on the 17th of this month, a young lady, aged 19, left her home, near Reigate, and proceeded in the direction of London,—this is to give notice that the above-mentioned sum will be paid to any one who will give such information as shall lead to her discovery. She is good-looking, has light hair, blue eyes, and a Grecian nose. Height, about 5 ft. 4 in. Address A. B., &c.

Such was the advertisement which two days after the last-mentioned occurrence, met my eye in the second column of the "Times." Poor girl, thought I. In the course of the same week, I was again obliged to travel by the railroad which started from London Bridge. I missed my train, and having two hours to wait, I resolved to pay a visit to an old female servant of our family who had married a detective policeman, and lived near the London Bridge terminus. I found her at home. Not long after her husband came in. The subject uppermost in my mind was quickly brought forward.

"Curious circumstance that, sir, which occurred on the line the other day, when a young lady managed to escape from us all. Of course, too, you have seen the advertisement in the "Times." Wish I could discover the runaway: why 300*l.* would be a small fortune to Sarah and myself."

"Have you any clue?" I asked.

"Oh, yes, sir! we all but had them. You see, sir, not only was the train examined, but all the foot-passengers and carriages as they left the station. The telegraphic message had been most positive, and 300*l.* reward, which it offered, put us all on the look-out. Unfortunately, I examined the foot-passengers; had I taken the cabs, the young lady, though so well disguised, would not have escaped."

"Thank goodness!" muttered I, inwardly, "you did not examine the cabs. Well, but how did she manage to get away?" I asked.

"Why, sir, you will hardly believe it—but dressed as a midshipman, in a cab, with a gentle-

man—him, I suppose, as was a-running away with her."

"But how can you tell it was her?"

"Well, you shall hear, sir. As soon as all the passengers had left the station, we detectives put our heads together. The cab containing the middy was mentioned. By a kind of instinct, I felt that must have been her. But, as it won't do to act on instinct only, I at once, having ordered a fast Hansom to be in readiness, telegraphed down to Dover—from which place the middy's ticket had been taken—to know if a naval officer had taken a ticket and paid half-fare by such a train. The answer was 'No.' Now a middy is not often very wise, but he is seldom so foolish as to pay full price for his ticket when he knows that, as he is travelling in uniform, he can go at a cheaper rate. I then telegraphed to all the stations between this and Reigate to know if anything unusual had been picked up anywhere on the line. The answer came back 'Yes.' In one place a bundle containing ladies' wearing apparel; in another some light-coloured hair wrapped up in paper. Without losing a moment I sent off in the Hansom one of my subordinates, with orders to drive fast towards Hyde Park Corner till he came up with a four-wheel cab, No. 906, drawn by a grey horse—to keep it in sight till its fare was deposited. If the people in the cab stopped at a private house, to watch the door, and not allow them to leave till I came up; if they were dropped in the road, to arrest them both at once, and bring them back here. A bold measure, sir; but remember 300*l*. reward, and perfect immunity guaranteed for any illegal arrest made under mistake. Well, will you believe it, that though my man overtook the cab in Fleet Street, and followed it to Hyde Park Corner, yet when both vehicles stopped it was found the birds had flown! How they got away is more than I can imagine; but they had escaped, and that, too, without any connivance of cabby, for my man brought him back here, and, on strict examination, I found not only that he did not know how his passengers had escaped, but had actually been bilked by them of his fare. He swore roundly he would summons them on his own account, if he could catch them."

I laughed inwardly.

"Well," said I, "any success yet?"

"No, sir; but we shall be sure to have the lady soon, if she is above ground."

"And why not the gentleman also?"

"The fact is, sir, that not only have we a most accurate description of the lady, but the policeman who looked in her side of the cab could tell me how she looked as a middy, and said—which first raised my suspicions—that she smoked like one who had never tried to do so before; the policeman, however, the other side of the cab cannot give much account of the gentleman because he smoked so desperately in his face. All he can say is, that he was gentlemanly-looking, dark-haired, and about thirty—at any rate, he spoke as if quite as old as that. The policeman is not clever, and yet he thinks he might know the gentleman again, if he saw him."

I at once resolved to postpone my journey from London Bridge, and then said:

"Can you tell me why the young lady ran away, or who she is?"

"I believe I could answer both your questions, sir, but I am not at liberty to do so—I must keep secrets."

"Very well. It was only curiosity made me ask. Now, I must be going. Good morning, Sarah. Good morning, Mr. Sharp. Mind, if you catch these people, or hear anything of them which you are at liberty to communicate, pray tell me, for you have quite interested me in the matter, and you detectives are so *very* clever, I quite delight in hearing your stories."

"Yes, sir, we are a little clever, we flatter ourselves. I shall be able to give you information in a week, I think. Good morning, sir."

TO CABMEN.—£500 reward will be given to the cabman who, on the 17th of this month, took up a gentleman and a midshipman in or near Fleet Street, if he will come forward and state to what house he drove them, provided such information leads to the discovery of the midshipman. Apply to A. B., &c.

Such was the next advertisement on the subject that I saw in the "Times." Well, thought I, she must be detected now.

Walking down Holborn, a month later, I hailed a Hansom that was passing, and ordered the driver to proceed to a house some little distance from London. No sooner had we got clear of the crowded streets, and into a road where a man did not require two pair of hands and four eyes to keep clear of other vehicles, than Jarvey, opening the trap-door in the roof, over my head, touched his hat, with a "Good morning, sir."

"Shut that door at once," I said; "are you drunk, man, and anxious that I should give you into charge?"

"No, sir; but I hope you are very well."

What could the man mean? There was a curious look in his eyes that plainly said he could fathom me, while, touching him, I was utterly at sea.

"I drove a four-wheel," he continued, "a short time ago, sir. I hope you and the young *gentleman*—the *middy*, I mean, sir—are quite well. Nice little *boy* that as ever I seed. You may remember I picked you up, sir, in the Strand, about a month ago, and after a bit you got out and left me to drive the middy on."

I like your memory, thought I, and then said:

"Well, I fancy I do recollect your face."

"Thought you would, sir, when I recalled the suckamstances to your mind."

"Now, then, stop, my man. I am getting near the house to which I want to go. Let me get out. I will walk the rest of the way—I don't see the fun of talking to you through a hole."

When I stood on the footpath I steadily gazed at cabby, he ditto at me, with compound interest and a leer.

"Well, now," I said, "what do you want?"

"Oh, nothink, sir—you're a gentleman."

"Do you read the papers, cabby?"

"In course I does, sir, 'specially the second column of the 'Times.'"

"Well, where did you drive the middy after I left you!"

"Eccleston Square, and then the young lady—beg pardon, sir, the young gentleman—gave me two sovereigns, and told me to drive away, and not look back."

"You pretended to drive away?"

"I did sir."

"You looked back?"

"I did, sir."

"You know where the midshipman went?"

"I do, sir."

"You are not rich?"

"I am not, sir."

"Now just tell me why you have not informed the police."

"Oh! for several reasons, sir. First place, though I am a poor cabby, I have my feelinxs, and wouldn't go for to betray a young gentleman who gave me two sovereigns."

"Nonsense," interrupted I.

"Next place, sir, you see, I never likes to press hard upon ladies."

"Cabby, do you take me for a fool?"

"Third place, you see, sir, I have been in trouble more than once, and I don't like them perlice, and don't care to show my face before them for any reason."

"Well, I can understand *that*," I said. "Now, there's a sovereign for you—you don't mind telling *me*, I suppose, where the middy went?"

"No, sir, not a bit; but you didn't hear my fourth and chiefest reason for not going to the perlice. Fact is, I don't know where the dickens the middy *did* go to. I did not look back soon enough. I twigged her going towards No. 1, Eccleston Square, and when I looked back she warn't in sight, so then I drives back to No. 1. A flunkey comes to the door, so says I, 'John, your young master has left summat in my cab.' 'Go to the dogs!' said he. 'Oh, yes!' said I, 'by all means; but, now, here is half-a-crown, John Thomas, you tell me who your young master is.' He pocketed my half-crown, and then told me that the middy had nothing to do with the house, that he had only asked if Sir Jasper Blares lived there, and on being told 'No,' had bolted round the corner. So then I axed the flunkey to give me back my half-crown, or, at any rate, to come and have it out in drink. The mean fellow told me, if I was not off directly, he would give me in charge at once. So, as I seed a Bobby a-coming up the square, I drove off. Now, sir, I know as little about the middy as you do. If I knew more, do you think I wouldn't go to the perlice, and get five hundred pounds instead of this here sovereign—much obliged to you for it, all the same. Good morning, sir."

He drove off.

"Done by a cabman!" was my exclamation. Well, I had done the detectives; that was one consolation.

Six months elapsed, and again I found myself in the detective's house. Meanwhile the reward for the lady fugitive had been increased to the extraordinary sum of 1000*l*., while that for the gentleman had been withdrawn.

"Well, Mr. Sharp, any news yet of the runaway?"

"Not a bit, sir; not a bit. It is extraordinary. I did not think we detectives could be so deceived; and let me tell you, sir, that though the reward in the public papers has been increased to £1000, yet that to us actually £3000 is offered, only it is not considered prudent to advertise so large a reward. You would be surprised if you knew what means have been taken to secure the young lady, and without success. A detective at every station out of London—one at each principal port in England; all the lodging-houses, boarding-houses, and public places of assembly in town have been narrowly watched; a detective has been sent to every county in England to pry about—go to inns, farm-houses, schools, and every place he can legally or illegally put his nose into; false entrapping advertisements inserted in the papers, and actually all to no purpose. However, we will have her yet. The reward will not be paid unless she is discovered within a year from this date."

"You will not find her, I expect," said I.

"We shall see, sir," replied he.

After a little more conversation I took my departure. Without being in any way able to account for it, or to reason on the subject, I *felt* I should first stumble on the lady in question. Not many days later, one idle Saturday afternoon, I went with a friend to a private lunatic asylum some little way out of London; he to see a relation confined there, whom he considered it his duty to have a look at now and then; I, out of mere curiosity to inspect such a place. Arrived at the asylum, he went off at once with the mistress of the establishment; I, under the charge of a female warder, was taken round such parts as are shown to a visitor. In one room was a girl with long dishevelled *dark* hair, and blue eyes, swinging on a rope hanging from the ceiling. She was dressed in Turkish fashion. Strange! thought I; dark hair, blue eyes. "What is the matter with her?" I inquired.

"Oh, she is mad, but harmless enough; her friends are very rich. She has a fancy for dressing so, and the mistress allows her. At times she is not so bad, and then she lives quite alone with the mistress. She is always worse when she sees strangers, and talks mere nonsense when they are present. Listen to her. She is singing such rubbish now."

And so she was, but yet there was a method in her jumble of songs, such, I almost fancied, as a person might be driven to use who wished to feign madness. I eyed her intently. She was looking at me with apparent carelessness. 'Can it be *she*?' thought I. 'Oh, no, it cannot. She would surely recognise me.' At that moment I bethought me of the pearl ring. Generally I wore it with the pearls turned inside to the palm of the hand. I lifted up my finger, and deliberately turned round to her full view the conspicuous part of the ring. With a shriek of anything but madness she ran away.

"Oh, she is gone," said my companion, "to the mistress's private room. She can always go there when she likes."

I was satisfied, and said nothing, but waited for my friend and the head of the establishment, the latter of whom I intended to see alone. In a minute or two a telegraphic message, stating that I must return to my chambers in town, to a consultation, by the first train, was put into my hands. I consoled myself with the idea that I would come down again on Monday. I inquired the name of the mad girl, made my bow, and in three quarters of an hour was deep in law in chambers.

Monday morning found me at Mrs. ——, near Hanwell.

"Is Mrs. —— at home?"

"Yes sir."

I sent up my card, and when admitted, I forthwith proceeded to make inquiries about my friend.

"Oh, she was taken away yesterday by her friends. She has been improving lately, and was removed about two o'clock yesterday."

"Do you know where she came from, or where she has gone?" said I.

"Not at all, sir."

I saw the woman was telling an untruth, but how could I expose her?

"Do your patients generally come and go in that extraordinary manner?"

"Oh, constantly, when introduced and taken away by a doctor."

"Then her friend is a medical man?"

"No, sir, I did not say that; her friends brought a medical man with them."

Untruth No. 2, thought I.

"And what is his name, pray?"

"That I *must* not tell."

Truth the first and last, I thought.

"I can give you this clue, sir,—they went down the line, for I know they took tickets to Exeter."

"Thank you," said I, inwardly concluding that that was untruth No. 3, and that therefore (as turned out to be the case) the parties had gone up the line—probably to London. I then became more open, threatened, coaxed, tried to bribe, and at last was told that if I did not leave the house at once, I should be turned out by the men-servants. Out I accordingly chose to go of my own free (?) will. In vain I twisted and turned everything over in my mind. The mistress of the establishment was not to blame—I could not bring her into court, for I dared not prove any interest in the young lady. Besides, I might have been mistaken, and in that case how foolish I should have looked. I was obliged, again, to fall back on Time, the great solver of mysteries. At length Time came to my relief.

About eighteen months after the last-mentioned circumstance I was junior counsel in some trial in London. It was my turn to examine the next witness—a somewhat unimportant one, by-the-bye.

"Miss Evelina Shirlock."

"Miss Evelina Shirlock" was repeated by the man in office. Forthwith the usual oath was administered in the accustomed rapid, careless manner—"The evidence you shall give," &c., &c. I had not as yet looked up, for I was running my eye over my brief; but when I did, I was so startled as nearly to jump out—not of my skin, but—of my wig.

Good gracious! More beautiful than ever, and self-possessed, there stood before me in the witness-box my long-lost middy friend.

Now, if a barrister ever loses his presence of mind, he is not fit for his profession. I very nearly, but not quite—never, however, so nearly as then—lost my presence of mind. However, my wits did not quite abandon me. At a glance I saw that the witness did not recognise in a grey curly wig, and with a sedate face, her former ally with dark locks and a merry countenance. At once I thrust deep into my pocket my pearl-ringed hand, tried slightly to change my voice, and began:

"Your name is Evelina Shirlock?"

"Yes."

"You live at Sun Villa, Regent's Park?"

"Yes."

"You are described, I see, as the niece of Sir John and Lady Clanmer, living at the same place?"

"I am."

"Have you lived there long?" She got confused. No answer.

"Have you lived there long?" I repeated.

"What on earth are you at?" whispered my senior counsel on the same side. "You will so bother the girl with your questions, which have nothing to do with the case, that she won't be able to give the evidence we really want.

"No, I will not," I replied; but I saw the lady change colour rapidly more than once, sigh, give tokens of fainting. I put my handkerchief to my face. "My nose is bleeding," I whispered to my senior. "You examine this witness, I will take the next."

At once I left the court. The witness did not, I believe, acquit herself in first-rate style, for which I got the blame. My irrelevant questions I attributed to a throbbing head, in corroboration of which my supposed bloody nose did me good service. The evidence, I knew, could not materially affect the case, and I had elicited what I wanted. No sooner was the court up than, having changed my clothes and flung my papers at the astonished clerk's head, off I drove to Sun Villa, Regent's Park.

"Is Miss Shirlock at home?"

"Yes, sir."

"Take my card up, and say that I am the gentleman who examined her to-day in court, and that I wish to see her."

Quickly, radiant with beauty, she entered, leaning on her aunt's arm. She shook hands with me.

"Oh, aunt!" she said, "this is the gentleman to whom we are so much indebted, and to whom my warmest thanks especially are owing. But, Mr. Stonhouse, you were too hard upon me in court. When I fancied I began to recognise you, I thought I should have fainted."

"Indeed, Miss Shirlock, you must make every allowance for my excitement on so unexpectedly meeting you, after having in vain sought you for many a long month."

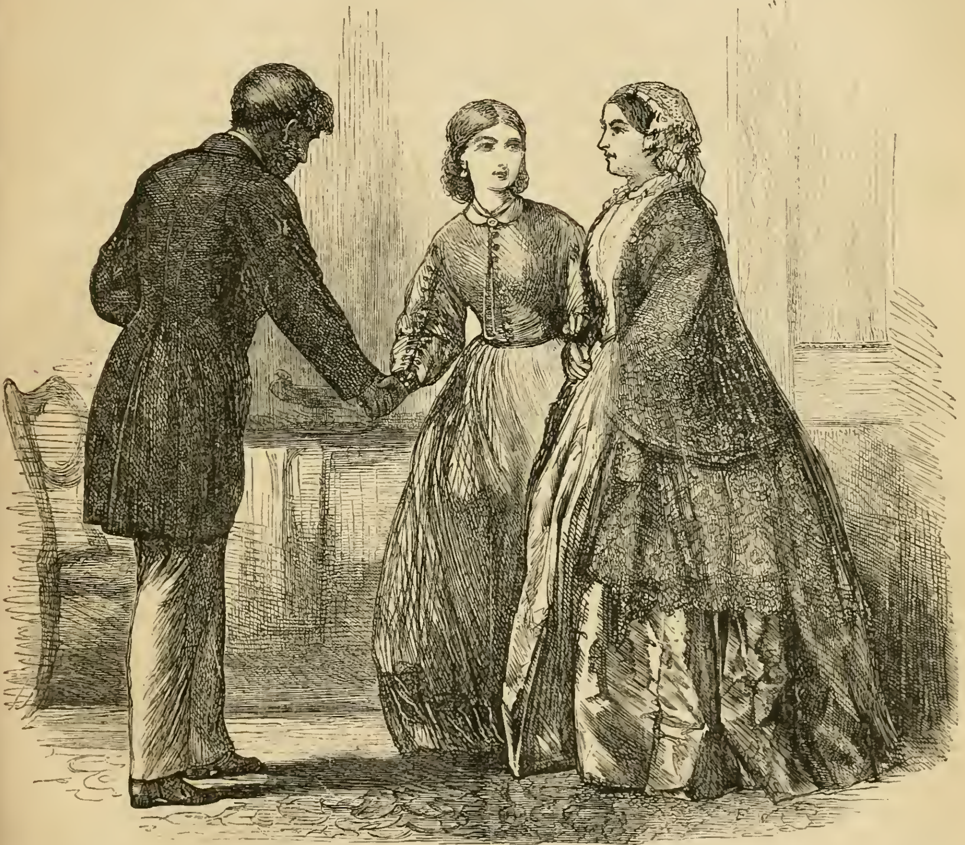
Lady Clanmer kindly asked me to dine. Sir John had already started for some Lord Mayor's

feast in the city. Of course I accepted. Dinner over, and a decent time having been spent at the dessert, the old lady rose, saying :

"I shall leave you two together, for I daresay you have a great deal to talk about."

We *did* talk. Each of us told our own story. With hers you shall forthwith be made acquainted in her own words. Seated by me, she began :

"I am the only child of Mr. and Mrs. Shirlock, of Rokeby Castle, near Reigate. My father originally was very far from wealthy. All the property and money came from my mother's side. Unfortunately, I lost my mamma when young. By the marriage settlements, which had been conceived in a most grasping manner by my maternal grandfather, who disliked my father, and which were shamefully worded, it was ordered that if my mother died first, the child or children should, on coming of age, inherit all the property (about 10,000*l*. a year) and the house, and that my father should only be allowed 500*l*. per annum for the rest of his life. I mention this as a slight excuse for my poor father's most shameful conduct. When I was about seventeen years old he began to get very anxious. He could not realise the



idea of coming down from being master of Rokeby Castle and a large fortune to a paltry pittance. He knew that even if I did not assert my legal rights, a husband, sooner or later, probably would do so for me. Had he dared, he would have killed me. He often said as much. When I was about eighteen, he told me he had found a husband for me whom I must prepare to marry. Now, at that age I really was averse to the idea of matrimony, and when I was introduced to my would-be lord and master, my dislike knew no bounds. After a little time I discovered that my father had entered into an agreement that if Mr. —— married me, my husband and myself were to have 1000*l*. a year, and my father the rest till his death. Mr. —— actually bound himself in writing to give up to my father 9000*l*. a year and Rokeby Castle if my father would make me marry him. Now, the money and the castle I never cared about ; my father might have had those with all my heart, as he ought during his lifetime ; but to be bought and sold, to be compelled to marry an odious man (for odious he was in every way), to be compelled to marry an odious man, to be made a—"

Miss Shirlock burst into tears. After a time she continued :

"I need hardly say that on discovering the underplot I resisted more stoutly than ever every entreaty, every threat, every bribe, made use of

to induce me to marry Mr. ——. Things went on this way till I was nearly nineteen. It was bad enough for me, I confess, but not enough so in my opinion to justify a daughter in running away from her parent's roof. About a month before I met you, my father sent for me. After a long interview, in which I steadfastly maintained my ground, my father dismissed me, saying, with an oath, 'You shall see what it is to disobey me—you shall undergo worse than death.' From that moment I was closely watched, not allowed to see any one, confined to my room and a stroll with an attendant for an hour a day in our back garden. In a short time I was visited by two medical men, who quickly informed my father that they were satisfied, and would do as he wished. The meaning of that my father next day told me, namely, that for 500*l.* each the medical gentlemen had signed a certificate stating I was mad; that he had met with a nice private establishment and an accommodating, easy-conscienced, though hard-dealing mistress, who was utterly devoid of feeling; that in a fortnight's time, if I did not marry Mr. ——, I should be confined for life. 'Yes, for life, and in a mad-house, miss!' but I will not repeat his fearful language. My servant was faithful to me, whatever her other faults were. By my request she searched my father's private papers, and found that things were exactly as he had stated. Long before this I had written to my mother's sister, Lady Clanmer—then living in Paris—but in vain. My letters were all intercepted. What *could* I do, but run away? I knew full well that I should be telegraphed for, because when not in my room, of which my father kept the key, I was visited by him every quarter of an hour in the garden, just that he might see I had not escaped. Day after day I had marked the regularly running train in which we first met. By a heavy bribe I obtained a midshipman's dress and a ticket marked Dover to London, from one of the porters at the station, who had been in our service. I suppose he got it from his brother, the driver, who had come from Dover. I also begged him to keep an empty first-class carriage for me; and instructed my maid, as soon as she saw the train actually in motion, to return with a scratched face, and say I had knocked her down and run off to the station. All went right till you jumped into the carriage after the train had started. That led to my strange question, 'Pray, sir, are you a gentleman?'"

We were both silent for a time.

"Well, Miss Middy," I said, "you have enlightened me as to your history down to our first meeting in a train, will you kindly condescend to give me a history of yourself since our parting in a cab?"

"Most willingly," replied she, smiling through her tears. "You have been quite my preserver. After leaving you I drove near the residence of one of the medical gentlemen whose names you had given me, got rid of my cabman" (you little knew, thought I, what a narrow escape you had there), "and went to the doctor. On finding he was at home, I walked straight in, told him my whole history, and threw myself quite on his honour, begging him to conceal me effectually for two years, when I should be of age. After a time, chiefly owing to me, the idea of my going into voluntary confinement in a private lunatic asylum was hit upon and matured. There I should never be sought. There I went. The mistress, a kind lady, was of course in my secret. I did just what I liked. Able lawyers were engaged to watch proceedings for me in the outer world. In case of accident I wore a wig of dark hair. All went well till you by chance stumbled on me in the mad-house. Your kindness, your good nature, I did not doubt, but I did not then want to meet you. That same afternoon I telegraphed for Dr. ——; that same night I was in his house, and commenced my new duties, to avoid suspicion, as governess to his children. In three months' time my father died. My legal friends secured my rights for me. My uncle and aunt had come to England. I told them my story. They were horror-struck; but I thanked God I was a free agent. My next object was to find you. I did not wish to make ourselves too conspicuous, so I refrained from advertising; but in every other way tried, without success, to meet with you. Time after time have I followed in my carriage a cab which, after all, contained the wrong individual. Thank goodness, at last we met, though it was in a crowded court, and though, Mr. Stonhouse, you were a little too hard upon me. And now let me thank you," said she, putting her hand confidingly into mine. "Oh, you cannot tell how much I do thank you for your former great kindness to me."

I soon became very intimate at Sun Villa. On the events of the next year I must not dwell much. They are too painful. Day after day I rode with Miss Shirlock in the park, dined at Lady Clanmer's house two or three times a week, escorted her and her niece constantly to the opera and theatre, for Sir John did not trouble himself much about such places, and was only too glad to place the ladies under my charge. I neglected my law business to such a degree, that even now I am slightly suffering from it. As for *loving* Miss Shirlock, of that I never dreamed. One day I said to her:

"Middy" (I had learned to call her so), "what have you done with the likeness I gave you in the train?"

"Oh, I do not know," she replied. "I do not want it so much now that I am acquainted with you: my chief reason for keeping it was that I might recognise you again."

Of course we often laughed and talked about our first meeting. Time after time we used to talk about my engagement.

"Middy, how is it you do not marry? I know that Captain Fitzgerald is dying for you—Mr. Carlyon is desperately in love—the Honourable Augustus Bonchurch would give anything to call you his own. Why don't you make one or other of these gentlemen come forward, or, rather, why do you continue to refuse all your admirers one after the other?"

"Oh, I do not know, Mr. Stonhouse; I do not love them; they are only attracted by my pretty face or fortune."

"Well, but some are sensible men; why don't you *try* to love one of them?—you will in time if you try?"

"Pshaw!" burst in Middy. "How *can* you talk such nonsense, and profane the name of love in that way? If I were driven to seek a home, or, like a very young girl, had no experience, the case might be different. Even then in a short time I should find out that I had acted wickedly."

"Well, but Middy—" said I.

"Now, don't go on in that way. Mr. Special Pleader. You are not holding a brief for which you are paid, so you are not bound to speak what you do not believe."

In the course of eighteen months, towards the close of the London season, Middy and I one afternoon were together in the garden, I lying on the grass smoking, she seated near me.

"Middy," said I, "give me joy: the old relation who stood between me and matrimony is supposed at last to be dying, and probably in the course of six or eight months I shall no longer be a bachelor."

"What, Frank!" she cried. "What, going to be married?"

"Yes, Middy," said I, somewhat puzzled. "You knew full well I was engaged."

"Yes, but, but—"

She said no more, but fell on her face fainting. Here's a mess, thought I, as I rushed to a neighbouring friendly fountain. "Here *is* a mess!" *exclaimed* I, as, on returning with water, I saw that my picture and a locket with hair in it of the same colour as mine had, by the fall, been shaken out from her bosom and lay beside her. I had often noticed a small gold chain round her neck, which, descending into the folds of her dress, was lost to view; but little fancying what was appended to it, I had thought it intrusive on my part to ask what was at the end of the chain. And she had called me *Frank*, too, for the first time in her life. "Oh, what a mess!" groaned I. Well, I dashed water in her face. In the course of a few minutes she came round, sat up, replaced my picture and the locket. Her eyes encountered mine: for a very brief space of time we gazed steadily at each other. For once in my life I was fairly at a loss to know what my eyes said. She quickly recovered.

"Let us walk," she said, "it will do me good."

Up and down the garden we sauntered for a short time, talking of my wedding, she congratulating me, I answering in monosyllables, and wishing myself anywhere but there. As soon as possible I said good morning, and went out at the garden-gate. It were impossible otherwise I should like to analyse the way in which we shook hands with each other.

"Cab, sir?"

"Yes," replied I, opening the door at once and shutting myself in.

"Where to, sir?"

"Oh, Jericho!" replied I.

And, now, being alone, I began to meditate. Middy loved me to distraction, that was clear; ay, and loved me, too, in the fullest, truest sense of the word, purely and for ever. Now for self-examination.

"Where to, sir, did you say?" interrupted cabby, putting his ugly frontispiece round to the window.

"Jericho!" replied I angrily. "Can't you hear?"

Cabby shuffled on his seat, lashed the horse, scratched his head,—lashed the horse again. Now for self-examination. And lest the reader should have his or her curiosity excited, and take me for a patent fool, let me at once say that I have not been a barrister for twenty years without having a wholesome dread of putting myself into a witness-box. My self-examination and answers I keep to myself. Suffice it to say, I have been married fourteen years and have eight children; but, inasmuch as my income is not large, I should have been just as well pleased with four, if the other four had not come. Each child, however, has added a fresh link to the chain that binds me closely to my affectionate wife, and were she on trial, I defy the united abilities of a hundred horse-power attorney-general and ditto solicitor-general to elicit from her that I have been anything but, in word and deed, a most kind, tender, and attached husband.

Owing to a crowd of vehicles we came to a stand-still in Oxford Street.

"I say, Bill," exclaimed my driver to a brother Jehu, "have you ever heard of Jericho? Where is it? Gent inside wants to go there."

"Can't say, Jim," responded whip No. 2, "unless it be smack through the city or t'other side of the water. Try 'em both and then swear you have lost your way."

This recalled me to my senses, and made me think of the insane address I had given my driver.

"Cabby, I will go to the Temple instead of Jericho."

"All right, sir," said he evidently much relieved, and such is the sympathy between man (when a good driver) and beast that the horse likewise was evidently much relieved.

My long-lived relation, I need hardly say, did not die that bout, and so another season saw Middy and myself again in town together. We met, we were friends, talked to each other, sometimes rode together, but neither of us ever alluded to the garden-scene. Each clearly wished, each as evidently dreaded so to do. Somehow or other I was obliged, as I explained to Lady Clanmer and herself, to apply more steadily to my increasing practice. Somehow or other, too, when I called, Middy occasionally was not at home, pleading when we met indisposition as her excuse for not receiving me. The chain still hung round her neck; whether or not its appendages were there I could not tell.

Towards the close of the season 1844 my relation at length departed this life. In the following autumn my bride and myself entered on our new life and went abroad. Cards, of course were sent to Lady Clanmer. On our return I found, forwarded to our new house in Curzon Street, Mayfair, from my chambers in the Temple, Middy's wedding-cards.

Thank goodness she has got over it at last, thought I. She had married the eldest son of a

Scotch peer. I knew him. A kind, honest, straightforward man, but not over-gifted with wisdom. He and his wife lived in Scotland, hardly ever coming to London. Once after we were both married Middy and I met. I danced with her. *The chain was still round her neck.* I am afraid to say how deeply I drank that night at supper, without being in the very slightest degree intoxicated. Port wine had as little effect on me as water. Occasionally, on the birth of one of my children, congratulatory letters passed between her and me. She, poor thing, had no children. Every August brought us a hamper of grouse from Scotland; every Christmas took from Curzon Street a cod's head and shoulders, oysters, &c., directed to Middy's husband. Those presents also occasioned a biennial interchange of letters.

People say that all married persons have a secret corner in their hearts, not at all of necessity a guilty one, which they never, by any chance betray to their partners for life. May be so. All I know is that I never told my wife of my antecedents in connection with Middy.

"On the 25th inst., aged twenty-six, owing to a fall from her horse, Evelina, the beloved wife of——"

I started, dropped the "Times." Good gracious! poor Middy then is dead. Hastily I looked round —my wife was not in the room. The paper, properly folded, was quickly replaced on the table and off I went to chambers. Presently I heard a great fuss in my ante-room, and my clerk's voice expostulating in no mild terms:

"You can't come in. Well, I tell you, you shan't come in. My master, Mr. Stonhouse, won't be disturbed by the like of you."

I rang my bell.

"Who is that?"

"Some poor woman, sir. She says she must and will see you herself. I have threatened to give her into custody, but she won't go away, and won't tell me her business."

"What is she like?"

"I can hardly tell, but I think, sir, she is a Scotchwoman."

"Show her in."

In she came, and asked me if I was indeed Mr. Counsellor Stonhouse, then would I just open that parcel and see if it was all right. I recognised Middy's writing, opened the packet with trembling hands:

"It is all right," said I, offering the woman a sovereign, and adding, "can I do anything more for you?"

"No, sir; many thanks to you, but my travelling expenses have been paid, and as for the rest I would do anything in the wide world for that dear gude leddy, who, when alive, was so kind to me and my puir bairns."

With that she departed. Again my bell sounded, and the clerk, on intruding his inquisitive face, was told, "Do not let me be disturbed by anybody on any account for the next hour."

The last words I heard before settling down to my reverie were,

"My good woman, why could you not give me that parcel instead of taking it to Mr. Stonhouse yourself?"

"Gang to the deil wi' ye, ye auld fule; do ye think that packet was for the likes of ye to handle; ha, ha, ye auld fule."

The door was indignantly slammed. Poor Middy had chosen a coarse-tongued but faithful messenger. The packet contained a letter, my picture, a song, and *the* chain and locket.

The letter was written of course under most highly excited feelings, if not actually under the influence of delirium. I put it, the picture, and the song into my fire. The burden of the song (I had often heard her sing it) was, "Will she love you as I do?" The locket I dropped into the Thames that night. The chain my eldest daughter wears round her neck. In my pocket-book I have the tress of hair she gave me in the railway carriage when under such strange circumstances we first met.

Frank had finished. For a quarter of an hour neither of us spoke. It was dark. I could not see his face. Once I heard him mutter "Poor, poor Middy." It might have been poor dear Middy. I am not sure. Tears, I fancied, were trickling down his cheeks. Not in the slightest degree from a wish to hurt or annoy him, but more from carelessness and heedlessness than anything else, I thought I would try to ascertain his real feelings. In a few moments he said:

"Any more wine, Charles?"

"No, thank you," replied I; "but, Frank, I say, did you ever read Ivanhoe, and do you remember just at the end, where Walter Scott says with reference to Ivanhoe, Rebecca, and Rowena, that—"

I had gone too far.

"Temple," said he sharply, addressing me by my surname, "you said you would have no more wine; if *you* are not going to the ladies, *I* am."

He moved towards the door, but returned, took my hand, squeezed it, and said, "Charlie, I did not mean to be so abrupt. I hardly knew what I was saying. I feel a little relieved at having told you this chapter of my life; but mind," whispered he, almost fiercely, "mind never allude again to what I have to-night related."

We went upstairs—Frank going first—to his dressing-room, probably to wash away traces of emotion. A quarter of an hour later, with his rich tenor voice, he was joining in some merry glee. As I looked at him, I thought how little sometimes do our nearest and dearest relations and friends know of what passes beneath the surface. Oh, how little did I conjecture what was coming when first I heard the commencing words of the story,

"Pray, sir, are you a gentleman?"

Charles Temple.

HOW WE SAVED OUR MADEIRA.

It was the close of our Christmas dinner, and we were draining the last bottle of the old Madeira. The vintage was exhausted; and we knew, when we reverentially placed the aged flask on the table, that under existing circumstances, it was to us as the sole survivor of an Indian race—the last of the Madeiras.

With wistful eyes we watched the golden tide ebb lower and lower, and not a few calculations were made by expectant members of the half-circle about our fireside, as to who would be the fortunate allottee of the last precious drops.

Radiant to the last, like a sun, it finally set into the wine-glass of an old gentleman, whose seat was nearest the fire.

Others of the company had drained their glasses, fearing that, unless they exhibited a decided deficit, the costly wine would, by acclamation, be passed onwards. Not so the old gentleman. Slowly and solemnly he added the remainder of the Madeira to his already fair supply; then, heaving a sigh, he handed the empty bottle to his disappointed successor, placed the full glass on the mantel-piece, and piously contemplated it.

There was a befitting silence for some moments.

The old gentleman tasted his Madeira with a melancholy relish, and having attracted everybody's attention by an exaggerated "hem!" volunteered the following story, which, as I recollect it to have eclipsed any other on the same occasion, I have attempted to reproduce briefly, thus:

In the island of Barbados, it was usual for absentee land-proprietors to be represented by some agricultural agent or, 'attorney'* as he was called there. This important functionary, in common with most people in England, had his boxing season at Christmas; and it was customary to send certain annual presents for his acceptance, such as hams, barrels of spiced beef, cheese, and wine.

Some years ago a Mr. Hollingsworth was the attorney or manager of certain estates in Barbados, called the Codrington estates, under trust to the Society for the Propagation of the Gospel.

As usual, at Christmas time one year, this gentleman received as a gift a hogshead of special Madeira.

As might be supposed, great value was set upon the wine, and all care was taken of it during its transit to the island.

On an appointed day, orders were given for broaching the cask, and great expectations were naturally raised; a group surrounded the hogshead —the cooper was called, the wine tapped; but, to the vast disappointment of all, the Madeira was found to be in an highly acetous state—in plain English, the valued wine was *vinegar!*

Something had happened to it! Everybody said so. Knowing hands declared, perhaps not without truth, that the failure was owing to defective fermentation, insufficient fining, or careless casking. Be that as it might — the wine was spoiled, and, save for kitchen purposes, worthless; and even for that use it was not as yet entirely fit.

Well, the cask was rolled out into the mill-yard with expressions of disgust; the head unhooped, and carelessly placed over the top of the hogshead for the purpose of allowing the rays of the sun to ripen the deceitful Madeira into honest vinegar; no dependence was to be placed in it—it was left to its fate.

Some six or eight months afterwards, upon the occasion of some festivity at the "great house," the preparation of some *pièce de résistance* required the assistance of vinegar. The kitchen stock was exhausted—the nearest neighbours, of course, were singularly enough in want, at that moment, of all the little that remained to them. The waiters were at their wits' end; and the cook, under the combined influence of pressure of work and the absence of the necessary ingredient, was almost a maniac.

Heated negroes rushed tumultuously to Mr. Hollingsworth with the lamentable tidings. He soon bethought him of the despised Madeira; on the hint, away flew the rabble to the mill-yard, and instantaneously some of the contents of the exiled cask were drawn off in a jug.

But no expression of relief shone in the intelligent countenances of those who hastily tasted the liquor. Evidently their difficulty was not solved; something was the matter with the Madeira again!

Slowly the drawers retrace their steps, bearing the jug with the perverted liquor at arm's length, lest the manifest presence of a darker power than even Cuffee himself should do them harm.

Mr. Hollingsworth tasted the contents. He started! Surprise, but not alarm, agitated him. The negroes watched with mistrust and fear.

Mr. Hollingsworth tasted it again: he smiled this time. The negroes breathed again.

There was a strange convulsion of Mr. H.'s eyelid; it was a telegraph of inward appreciation.

"Roll the cask into the cellar—hoop on the head carefully—lock the door and bring me the key."

The order was rapidly obeyed.

Dismissing the still unsatisfied negroes, Mr. Hollingsworth creeps to the cellar—enters—taps the wine—tastes it again—drinks it—he laughs aloud! and why? The vinegar is no longer vinegar, but *superlative Madeira!*

* * * * *

How they drank that night! Evidently the host had kept the good wine until now. How they drank! and was there ever such Madeira! General Haynes endorsed it; and the then Rector of St. John's Parish certified to its merits "with meditative grunts of much content."

* * * * *

Well, the wine didn't last very long. The climate of the West Indies is, I confess, a very thirsty climate. It passed away, deeply regretted by all who knew its worth. And when they came to the bottom of the cask, the secret came out, which had worked this wonderful cure and metamorphosis. At the bottom of the hogshead, in various stages of decomposition, lay the bodies of four or five large RATS!

* * * * *

It is well known that animal matter refines wine. The rats, thirsty souls, stooped to drink, and met an acetic grave.

But their good lived after them, and their

* "Attorney," in the original and etymological sense of representative.

epitaphs were the praises over the Madeira they had saved.

* * * * *

Mr. Hollingsworth never forgot the liquor which, as Pope says, was

At once their vinegar and wine.

R. REECE, Jun.

THE COMET OF 1861.

SUNDAY night: a bright soft cloudless summer night. The bells of the old church of St. Thomas, Portsmouth, had just chimed one, and numberless other bells swung by human hands were doubly echoing the leader's signal from the decks of the men-of-war lying far up the noble harbour. I closed the book in which I had been writing-up the journal of the past week, as it always is my custom to log it down, for evil or for good, before beginning the work of a new week; and, with a weary yawn, turned away to undress. As I passed the window I suddenly caught sight of a blaze of white light, spreading high into the expanse of the heavens, and looking attentively and wonderingly at it, I perceived that it was a great and very beautiful comet. I threw up the window to look the better at it, and then the murmur of the distant city came towards me, to tell me that many other eyes beside mine were gazing on that glorious object. It well deserved that title, for the size of the stranger appeared greater than any I had ever seen before, its nucleus being clear and brilliant, and its wide-spread tail, with an inclination but slightly inclined from the perpendicular, clearly visible beyond the zenith. I felt dazzled with the beauty of my new discovery, and began to feel a longing for sympathy in the matter, and a desire as well that others should see and admire. I ran down stairs and roused my wife, her sister, and her maid. I told them of the magnificent sight now visible. They were in their first sleep, and did not appreciate the news. None of them would move; I felt keenly disappointed. So I pressed them with accounts of its dazzling beauty, urging them to wake and come to see what they might bitterly regret missing. At last I was successful: dressing-gowns with many groans were huddled on, caps doffed, and slippers donned; and with a cautious peep that no candles were lighted, out they stole, shivering and unconverted as to the necessity. But when they approached the window and saw the magnificence of the heavenly stranger, they exclaimed with delight that they would not have lost the chance for anything they knew. I felt proud and elated, pointing out to them the spread of the soft light as it died and melted away in the deep blue of the high vault of the sky, and the flickerings which every now and then appeared to spring from the bright star out of which all this luminous vapour appeared to flow. Then, as they stole back, awed yet rejoicing, to bed again, I closed the window to follow their example; and while I did so two thoughts upon this glorious theme came across me, which I think I will jot down on an extra leaf of my journal. The first was, as to what we really know about comets in the year of grace 1861.

Well, perhaps we may sum that up in saying that we have discovered a little about the motions of these luminous travellers through space, but of what they are composed, or whether they have any specific gravity at all, we know absolutely nothing. Still it is not a small triumph to be able in some measure to define the form of the orbit of a body which performs its mighty journey around our common centre, the sun, in more years than this great globe takes days to do the same. Still more is it to have set at rest those extravagant notions which perplexed nations, confounded emperors and kings, and set up gaunt superstition upon its tall stalking horse to prey on cruelty and ignorance. Even in more modern, and therefore happily more enlightened times, the fear of a brush of the tail of one such visitor brought sad tribulation in its train; but the matter which once was thought to engulph the world in destruction is now looked on with calmer eyes—Mr. Hind asserting that we really were in the tail of our present friend at the moment these thoughts were passing through my brain—and we saw, nearly two years ago, that the satellites of our big brother Jupiter endured a very considerable embrace without any evil result. If, then, when in actual contact they are harmlesss, surely at a distance, and in their significative or prophetic bearing, they may be held to be equally so. The day has thus passed away when men are likely to be moved to crime and fear by the apparition of

———The blazing star
Threatening the world with famine, plague, and war:
To princes death; to kingdoms many crosses:
To all estates inevitable losses:
To herdsmen rot; to ploughmen hapless seasons:
To sailors storms; to cities civil treasons.

Yet these are but negative blessings, the absence of evil and of the power of harming; have we nothing of a more positive order with which to congratulate ourselves on the arrival of so distinguished a foreigner? Yes, the wise tell us he carries in his train the certainty of a bounteous harvest in corn, wine, and oil; and wise matrons predict the happiness of twins to such wives who become proud mothers during the short interval in which the comet performs his perihelion around the sun, and is therefore a beauteous object in our earthly skies. But alas! like the former train of evils, we must scatter this latter of blessings also to the winds. True, indeed, it was, that when the great comet of 1811 appeared in the heavens, that year was prolific in the "good things" which the bosom of mother earth yielded for the use of her children, and even to this very day we sometimes see advertised a few dozen bottles of curious old wine for sale, the which, to enhance its value, is called Comet Wine. There is no doubt but that the wine of that year was especially good, and deservedly maintains its reputation, and, Deo volante, this present year may be equally blessed with a fat and fruitful season; but the old chroniclers tell us that when the great comet appeared in the year 1305, when Edward the First was tyrannising Scotland, "a general cold prevailed over Europe, and a severe frost at midsummer destroyed the corn and fruits." From the quiver of good gifts which the bright goodness was

supposed to carry, we must in fairness extract this arrow; and the other it will be safer to leave to the discretion and wisdom of the better sex, assured that on so intricate and knotty a point, they will shoot far nearer to the mark than we shall.

Thus, in spite of sage old saws and wise traditions, we have unwillingly torn to shreds this interwoven garment of good and evil, and surely we ought, in its place, to find something less flimsy by which to cover the nakedness of our ignorance. Can we not at least hint at, imagine, or conjecture any feasible use a comet may have in the mighty machinery of creation? We are, or may be, quite certain that it *has* a duty to perform, for the merest contemplation of the works of the Omniscient infallibly leads us to this knowledge, that nothing is created without a purpose, little as we finite creatures may be able to comprehend that purpose; and that all matter, whether organic or inorganic, possesses within itself, though separated often by vast stages of formations, the necessary power of restoration towards some specific end. The whole universe, as is well known, is a wondrous piece of mechanism, self-balanced and self-restoring, and the astounding discovery of Laplace, in which the worlds or planets, in their approach towards the sun, are provided in their mutual attraction one towards the other with the means for retarding the inward power of the great centre, and reversing the set of the spring towards its extreme outward limit, in the course of which slowly progressive operations mighty cycles of years are passed, set the seal to a fact which had been hazarded, believed, but never completely proved. We may see, on a smaller scale, the same law working in this our own unit among the other worlds. Here we find nothing lost, nothing wasted. The drops of water which apparently fall uselessly upon the ocean's lap, are sucked again up in vapour towards the vault of the firmament, there to collect, and, condensing on the mountain's side, to tumble back again in sparkling rills towards the parent sea, but bearing in their courses through the plains and valleys rich blessings both for man and beast. Matter is continually changing all round, nothing will for an instant remain *in statu quo*; dust is frittering and dropping away, unperceived, but not the less surely working, and passing off to re-aggregate and re-crystallise in some new form for the use of future generations many ages hence; gases revolving into one another perform the same round for the more immediate wants of living man, and prove to him the silent action ever going on around, and without the healing and self-restorative power of which he could no longer renew his own existence from day to day. Animal life, insect life, the works of man, are all contributing towards this great end,—the revolution and recombination of the matter of which this earth is composed; and what we call death is actually, in the simple alchemy of nature, but a dread and solemn phase of this universal law. *All* then is change, *nothing* is lost; and yet there is to this, apparently a remarkable exception. We say apparently, for if we believe the law to be true, we know, though we cannot prove, the exception to be erroneous. Ever since—what did we say?—long before this world was formed in its present aspect, floods of

The Comet, as seen from Portsmouth Harbour.

light have passed away from the central sun towards the outermost confines of the universe he controls; what is it which replenishes his wasting lamp, and continually restores the powers with which each instant of time he lavishly blesses his satellites? It is true we know not what light is, save that it must necessarily be some form of matter, though that form is as yet imponderable and immeasurable by our scales and scrutinies. Yet, confident in the self-acting machinery of the universe, there *must* be some means of refilling our great universal lamp, without which man and his dependents could no longer live. We do not jump at the conclusion, but is it impossible that comets, apparently composed of masses of vapoury light or luminous matter, aggregations as it were of the particles of light, should be the very servants of the universe, who re-collect and replenish the ever wasting power which nourishes and sustains it? Is it incredible that they, as slaves of the lamp, should sweep, in their long and mighty parabolas, out to the extreme confines of space; and reabsorbing the light from thence, should carry it back under their own regulated laws to the source from whence it proceeded; it may be with conditions changed, but so changed as to permit of its gleaning and garnering afresh. This is but a theory, it is true; it may never be proved; but nevertheless, until it is demolished by sounder views, until science has clearly lifted the veil of obscurity which now conceals the truth, it will be pleasant to think it not impossible, to say the least, and that least very modestly. It is the one link wanting to complete the balance in the self-renovation of the material of the universe, and it is a stepping-stone on which to rest the weary foot, while groping on and on through the misty darkness towards quenching the thirsty craving soul in the delicious waters of truth and knowledge.

This was my first thought, and then followed a musing upon the sudden manner in which the comet had become visible; and yet for many days past it must have been within mortal view, had it not been hidden by the circumjacent clouds. The veil was lifted, and lo! it shone before our wondering eyes in all its beauty and grandeur! Is this, or may we not think this may be, a type of the sudden coming of the Lord and Master of this universe, who was once received after his mortal humiliation by the clouds of heaven, and is again to come down upon his earthly kingdom encompassed with clouds and great glory? Of that day and that hour no man knoweth. It may not be for long ages yet to come, or it may be nearer than we think. Few there are who are watching for the clouds to break, and suddenly, when least expected, they shall be parted, and the light which is to restore this earth to its pristine beauty, shall shine out and utterly confound the unwatchful. No one suspected, no one thought, that behind the canopy which shut out the stars night after night, a magnificent globe of light was approaching nearer and nearer to the earth. Yet so it was; men and women went to bed this very night unthinking of and unsuspecting its presence, and suddenly a buzz and stir, which quickly swells upon the breath of night, proclaims that something unusual has occurred. So it is with the life of man and the many chances of destruction which surround it. A little nerve gives way, or a leak is sprung at sea; the slip of a horse's foot, or the tire of a wheel is loosened; and man, strong healthy man, is hurried across the Border Land, and ushered into the light of that Presence *where in truth he has ever been*, did he but know, believe, and remember it. The wise man will ever be mindful of his own frailty, and look for the parting of the clouds, and for the light which is surely beyond them.

As I turned away and closed the window, I had yet another thought—for the window itself reminded me of a woodcut in the beginning of some book on astronomy which I had lately seen, where the great Newton is represented sitting at his garret window, his hand upon his equatorial, and looking out upon the heavens at night. It were well at such a moment to pay the passing tribute of a thought to that immortal genius, and to that of his great compeer, Halley, the first man who understood the periodic revolution of the comet in its orbit, and with the noble words "I dare foretell its return," confidently proclaimed his belief far and wide. My thought was one of gratitude and pleasure, in the knowledge that I lived in an age of science which was denied to these giants of discovery; and that, thanks to their labours and mighty talents, the schoolboy now starts on the career and search for truth where they left off, with but a glimmer of that wondrous revelation of the subduing of the elements of the matter of this earth to our will which we have now achieved; and who knows when the clouds shall again part, and we may make some new discovery, which shall by it add, as steam and electricity have done, to the comfort and civilisation of our race? It may be that long before the cycle of time is passed which must again bring our glorious visitor within our terrestrial gaze, the mystery of its own assured mission will be solved by the restless brain of some now living Newton, destined to prove another phase of that simple yet immutable law of the Creator, who, for His own glory and our advantage, hath surely ordered all things well. R. B. M.

Relics of Byron.—We hear that the widow of Col. Wildman, the late owner of Newstead Abbey, has signified her intention of securing to that estate in perpetuity by deed of gift two well-known treasures whose associations are inseparably connected with the name of Lord Byron; the monk's skull cup, and the ancient communion service of the abbey. The former is the *well-known skull cup*, made out of the cranium of a monk whose remains were discovered by Lord Byron soon after coming into possession; the stone coffin which contained them is still to be seen in the cloisters at Newstead. The poet composed some Bacchanalian verses, which are engraved on the silver stem in which the cup is mounted: the lines are to be found in any edition of his works. The communion service is of gold, and the workmanship in excellent taste; it is a fine specimen of antique art, and is held in high veneration by the good people of Newstead and its neighbourhood.

THE SILVER CORD.

BY SHIRLEY BROOKS.

CHAPTER LXXXVIII.

Yet Laura might have safely and discreetly surrendered the volume to the applicant on board the boat. For he was not, as she naturally suspected, a hostile emissary, but an agent who had been employed at the desire of Charles Hawkesley, and by concert between him and the chief of the police. They had better reasons for the precaution than she could imagine.

Hawkesley, on returning from the bureau, after hearing the views of M. ——, had gone to the apartment of Arthur Lygon, and had apprised him of the catastrophe at Versailles.

Rarely has terrible news wrought such a change in the hearer as did these tidings cause in the hitherto impassive Lygon. He had listened in the calmest silence to the short introduction by which Hawkesley sought to approach the subject without undue abruptness, and had waited steadily for the narrative of the issue of the conflict; but when his brother-in-law announced that Urquhart was no more, the eyes of Lygon suddenly lighted up, his face reassumed its long lost expression of determination and self-reliance, and—it was a small trait, but characteristic of the man—he rose and gave a brief, business-like glance at the mirror, as if to satisfy himself that he was duly qualified to mingle again in the world upon its own terms. Then he turned to Hawkesley.

"Poor Robert! He deserved better than to die by such a hand. Has Adair been arrested?"

"No."

"You do not mean that he has escaped?"

"For the present."

"The police have let him escape?"

"They have not yet secured him."

"So much for the boasted French police! We will see whether our English heads can help them. You will come with me to Versailles?"

And with an alacrity which he had not displayed

since the day on which the one great blow had descended upon him, Lygon hastened to throw together a few private papers and other matters, and to secure them, and was then about to go out, when Hawkesley stopped him.

"What do you propose to do, Arthur?"

"What is there to do but one thing? Let us make the best of our way to Versailles, learn for ourselves what particulars we can, and if these police cannot hit upon the track of the miscreant, we may be more fortunate."

"You are for hunting him down?"

"Can you ask *that?* Do you think that I will rest until I have seen him brought out on the scaffold?"

"Sit down, and listen to me."

"Let us talk, if it must be so, as we go along. Come.".

"No. I have an answer to give in Paris, and it must be given after you have heard me. Ten minutes will suffice, and they will not be thrown away."

"You speak in a tone that leaves me no choice," said Lygon, laying his watch on the table before him.

"It is proposed to me by the police that we should let this man escape altogether," said Hawkesley, quietly.

Lygon uttered a deep oath.

"He is their confederate, but we could hardly have expected this," he said, furiously. "But they shall not save him. Come, let us get upon his traces. I have had some experience in such matters. If we once run him down, all the confederates in the world shall not save him."

"It is not for his own sake that they wish to spare him."

"For whose then, in the name of—"

"For yours."

"Mine!"

"I have asked you for ten minutes, Arthur, and you will do well to hear me out."

"For *my* sake!" repeated Lygon, angrily.

"It is my duty to tell you what has been said to me. Then you will act as you may think fit."

Arthur Lygon sat down opposite to Hawkesley, and fixed a steady gaze upon his brother-in-law.

"Finish, Charles. You are no trifler, but every moment we waste is a shame and a disgrace to Urquhart's brothers."

"There are duties to the living as well as to the dead, Arthur. Listen to me. Urquhart has died a sacrifice for a reputation that should be dearer to us than any memory."

"I do not understand you."

"It is all before me now, and you must not doubt for a moment that I am speaking the entire truth. The villain who has slain Urquhart had obtained possession of letters which Robert believed to be conclusive evidence against your wife, Arthur. She, poor wretch, terrified by his threats to use them, came to France to rescue them from him, in order to throw them before you, and beg you to judge and save her."

Lygon waved his hand impatiently, but made no reply.

"This is the truth, as God shall judge me, Lygon!"

"You desire to believe it, and you do," replied Lygon, quickly, "and that is all that you have a right to say. I do not believe it—"

"Nor desire to believe it?" asked Hawkesley, sternly.

"Do I desire to believe a lie? Did that dead man give credit to such a tale? We will not talk of this any more," said Arthur. becoming pale with emotion which he struggled to hide.

"We will talk of it, Lygon, while I have anything to say to you—or we never speak again. I have not shown myself so worthless a friend, I think, as to be so cast off, or to be denied what you would grant to a stranger. The happiness of Laura, of yourself, and of your children, is as dear to me as my own, and I will not be silenced while I believe that I can do you service by speaking. You must answer me, too. If I can prove to you beyond a shadow of doubt that what I have told you is true, what will you do?"

"Let us hunt down this murderer, and then we may speak of other things."

"Other things, Arthur Lygon! Are those words for the happiness of your own life and Laura's? Will you answer me now? If I have truly told you what was Laura's errand to France, will you forbid her to accomplish it?"

"Laura and I meet no more in this world. When Urquhart's death has been avenged, I will leave the rest to your care."

"May God deal to you more justice than you deal to the mother of your children!"

"You do not understand *me*, Hawkesley," was Lygon's calm reply. "Be content to believe that. Have you more to say?"

"But that I hope to save you and Laura yet; you and I should say no more to one another from this minute. But I will not be defeated by your resolution, until I have done my work. Do you hear me say that, Arthur Lygon?"

"Do you believe," replied Lygon, kindly, "that I ever doubted your affection for us? But you can serve no good purpose by endeavouring to make me share the deception that has been practised on you. By Heaven, Charles," he exclaimed, passionately, "if the past could be done away, and I could be once more what I was on that accursed day when I went to what I had left a happy home, and found the abandoned—" the words rose chokingly in his throat, and it was with tearful eyes, and yet a vehement utterance, that after a pause he finished the sentence. "If the past could be undone, as Heaven shall judge *me*, I could go a pauper and a cripple towards my grave, and go in gladness that I had known the love of a pure and true woman. A curse has come upon me, and I have not deserved it."

Hawkesley looked at him in silence, while Arthur dashed away the tears which he did not attempt to hide, and made an effort to recover his self-possession. Then the former said—

"I ask you, Arthur, for the sake of our relationship—for the sake of our friendship—for the sake of your children, one thing. You have no right to refuse it me?"

"What do you ask?"

"That you will see these letters."

"To what good? Why would you force upon me the evidences of my dishonour?"

"I ask you to read them."

"And if I should," replied Lygon, bitterly, "and if they should prove, as I suppose by your urging it you think they will prove, somewhat less conclusive than such cursed letters usually are; if it should chance to turn out that they leave only doubts where we believe there is certainty—what then?"

"Then I will say, Arthur Lygon, carry out your resolve, and let the name of Laura be forgotten by you. That is my reply."

"What do you expect?" asked Lygon in a low, despairing voice.

"I will not say. But I will ask you once more. If these letters utterly refute themselves, or, rather, prove that poor Urquhart read them wrong, and interpreted them into a terrible falsehood; if, in your own judgment, and I will ask no other, they testify to the truth and innocence of Laura, will you accept that testimony?"

"Hawkesley, you have not thought over all this as I have done. Heaven forbid you should ever have need to give such thoughts to anything in this world! But even you, with all your affectionate resolution to see comfort where there is nothing but blackness and sorrow, even you must perceive that the very story you have adopted is Laura's self-condemnation. There is a book of letters, such as must establish a woman's innocence—my God, that I should be alive and speaking such words about *my wife*—and the fact that a scoundrel has these letters drags the woman from her home and separates her from her children for ever. What strong delusion has laid hold on you?"

"I will not argue it with you. I will only ask you to believe it possible, and to say what you will do, should I be right."

"What else can I say than what I have said already? All is over between me and Laura. Let the inconceivable truth be that the letters are forgeries—do you assert that?"

"What then?"

"What—can you seriously hold such a thought? Does a woman fly her home in dread of a false charge? Would Laura have done so—Laura, whose courage at least was her virtue? Would she not have defied an accuser, and sent him to me to be dealt with as he deserved? Is it worth while to waste more time, Charles? Let us go to Versailles—or must I go alone?"

"Once more, will you see the letters? I do not ask you more."

"So be it, if you will. You have them?"

"No—the poor girl herself, who risked all to obtain them, and who has borne them away so gallantly, has them in her own keeping, and will hardly part with them again except that they may pass into your hands. But when they are laid before you, I have your promise to read them?"

"You have."

"One word more, and you shall go. I told you that the police officials, in proposing that this man should elude justice for the time, made the suggestion in your own interest. They naturally urged that vengeance on the murderer involved an exposure of the whole painful story which belongs to the crime, and that a woman's honour is mixed up with that story. If Adair escapes, the tale is secret. If he is tried, it is public, and you have children."

"Ah!" said Lygon, with a deep sigh. "You fling your whole case to the winds. What has an innocent woman to fear from the truth?"

"The world, which never accepts the truth?"

"To save pain, then, to a guilty wife, I am asked to pardon the murderer of one of the two dearest friends I had in the world."

"Had it been my destiny to meet the fate of poor Robert, and I could have spoken a last request, it would have been that you abstained from revenge, under such circumstances. Do you think that I would not gladly stand by you and see the man guillotined? But the faces of your little children come between me and that scaffold."

"Let us do right," said Arthur Lygon, "and leave the rest to Providence. I am suffering under an undeserved punishment, and I will not deserve any part of it by foregoing my duty. That man has died by a crime brought about by the sin of my wife. So far as I can aid justice I will do so."

"And little Fred and Walter, are they to be pointed at through life, Arthur, as the children of one who, as you believed, sinned?"

"I will hope that each will have strength to vindicate his own character, and then he need not care what is said of another's."

"And Clara?"

"Do not speak of Clara."

"I must. I have a right to speak for her, loving her so well. Arthur, you know what the world is to woman. Do not think of Clara as she now is, a child at play. Add a few years, and think of her as a beautiful and loving girl, whose destiny it would be to make some good fellow happy—only his friends look at her, and admire her, and pass on, and next day come and tell him that her mother was compromised in a sad French story, and that a daughter is, most frequently, what her mother was—could you bear to know that such things were said, Lygon?"

"You work hard upon my feelings, Charles, and now listen in return. I have all through life sought to act upon principle, and it is not when I come to the hardest trial of life that I ought to give way. And I will not. I would give *my* life for those children, but I will not forget my duty because hereafter my having done it may cause them pain and suffering. I will do my duty."

"You will do all in your power to arrest Adair?"

"I will, and I have waited too long. I must now go."

"I will not attempt to delay you any longer."

"And unless I am seconded by the police, I will go to a member of the government, and formally accuse them of screening the assassin. There may be reasons why they will not willingly lie under such a charge, and you can prove the proposition that has been made."

"I can. I will follow you to Versailles, Arthur. I have letters to write."

Lygon was at the door when he turned, and

saw an expression of deep grief upon the face of his friend.

Arthur returned, took his hand, and clasped it warmly.

"You do not understand me, Charles," he said, "but do not doubt that I understand you, and all your affection."

Hawkesley made no answer, but when Lygon released his hand, withdrew it, and rose to go to his own room.

He walked towards it slowly, and Lygon hastened away.

But as soon as Arthur had left the hotel, Hawkesley put on his hat.

"Then I, too, have a duty," he said, in a low voice.

And he returned as speedily as he could to the bureau he had so lately quitted.

CHAPTER LXXXIX.

"You have decided, I perceive, Mr. Hawkesley," said M. ——, receiving him with gravity, and at once resuming the conversation, as if it had been interrupted for a moment only.

"How do you know, M. ——?"

"Your manner tells me that you have done so. I may almost go further, and believe that the suggestions which I made on the side of forbearance have had their weight with Mr. Lygon and yourself."

"With myself only."

"Ah! I regret that. I am sure that you did every justice to the arguments."

"You would imply that I did not. But, had my brother-in-law been here, you would have found that the strongest reason which we could urge was idle against his conviction of what his duty demands."

"And that is—"

"That, as the nearest relatives of Mr. Urquhart, we claim all the assistance the police can afford us in tracing the assassin."

"Such, then, is your demand of me? I have told you that I will be guided by your wishes, but I had hoped a different decision."

"Such would be Mr. Lygon's demand, but he has hurried off to Versailles in the hope of being himself able to afford aid in the detection of Adair."

M. ——, notwithstanding the gravity of the occasion, could scarcely repress a smile, but it was momentary.

"I cannot, I fear, flatter you with the idea that he will effect anything which the officers themselves fail in achieving. If Ernest Adair is wanted," he continued, resuming all his habitual composure, "he will be in their hands in a quarter of an hour from my signalling that he is to be taken."

"He has been discovered, then," said Hawkesley. And the feeling that came over him was a mixture of gratification and repugnance—the prey was marked down, and it required an effort to let it escape. There was something of natural indignation at the crime, something of the hunter's fierce instinct, and reluctance to spare. There is more of this in many a sacrifice to justice than we may all care to allow.

"In truth, he can hardly be said to have been well lost sight of. The officers are intelligent, and they were assisted with great zeal by several persons whose enmity Adair had successfully cultivated. Specially foremost in the chase was the mechanic * * * *, at whose house Urquhart was in the habit of trying certain experiments, and who, with his wife, seems to have been idolatrously devoted to your friend. It is rare for our inferior classes to show such attachment to a foreigner, but Mr. Urquhart's character was of the kind that inspires the respect of the uneducated."

"He is in our hands, then?" repeated Hawkesley.

"When you will. I do not press you for any immediate answer—you have not taken half the time which I ventured to offer, nor, I suppose, have you seen the person whom I desired to visit you?"

"No. But it seemed to me that time was important. M. ——, I wish that Adair may be allowed to escape."

"No doubt. I could not suppose that you would come to any other decision. But you have surrendered your views in deference to those of your friend?"

"I have not. He has taken his own course, independently of me, and I claim the same liberty. In the interest of all who are concerned, I believe that I am acting best in requesting you to set the miscreant at liberty."

"We must not put it quite in that way," said M. ——, with the faintest curl of the lip. "He is not, in fact, in custody. But we understand one another."

Hawkesley then repeated a portion of the conversation he had had with Lygon, reserving, however, the threat of the latter to appeal to the Minister.

"I may save you some consideration," said M——, "by remarking that Mr. Lygon's idea that circumstances have given him any special right to interfere, is not worth discussion. Assuredly, it would have no weight with me. And I may be forgiven if I say that I seem to recognise a sort of vindictiveness towards his wife in his extreme readiness to connect her with the crime that has been committed. The accident which brought the two men together arose but partially from anything bearing on Mrs. Lygon's history—Mr. Urquhart was bent upon meeting the other, and would have succeeded, unless prevented, whether those documents had been in existence or not."

"I did not combat his view—I felt it overstrained," said Hawkesley, "but that matters little. You will, then, ensure Adair's escape?"

"I almost think that you believe him in increased danger from the efforts of your brother-in-law."

"Mr. Lygon is a shrewd and resolute man, and I cannot say that he may not obtain such clues as may make it difficult for your officers to hold back."

"There will be no holding back. But now, Mr. Hawkesley, do you desire to impose any terms upon the man whom you are releasing? They are easily made under such circumstances."

"But not easily enforced."

"I will undertake that whatever engagement Adair enters into with you, he shall fulfil to the letter. Were your friend Mr. Aventayle here, he would tell you that there are terrors for those who are mad enough to forget pledges given to *us*."

"If it were possible to induce him to promise one thing—"

"I promise it in his behalf."

"It may be more important than you imagine. If he would go to England, and there keep himself in readiness to afford some information—"

"Any you can ask of him."

"I? Do you think that I could ever find myself again face to face with the assassin, without striking him down? No, he must submit to be questioned by those who will not know to what a miscreant they are talking."

"He shall submit. I have some guess at the nature of the evidence you would extract from him, but we will speak of that presently. I am glad that you have come to this decision. I need not add to an English gentleman, that he will not unduly speak of what has passed. I make no absurd request of a pledge to secrecy, but I dare say that you will take care not to mention anything to zealous persons who may have notions like those of Mr. Lygon."

"I shall be too glad to be silent—to say nothing of my personal debt to you."

"Say nothing of that. We will now send for Wolowski."

CHAPTER XC.

"You were not, I am sure, fool enough to think of taking that window," said M. Wolowski to Ernest Adair.

The Pole entered, somewhat hastily, a garret with sloping roof, and with one square window that would just have permitted a slight man to pass through it. The room was at the top of a lonely old house about three miles from Versailles.

Adair turned upon the Pole, but there was no menace in the look of the slayer of Urquhart. He was haggard and nervous, and the effect of the terrible conflict he had gone through, and of its fearful issue, was visible in his easily agitated frame. His eyes were bloodshot, and his tongue incessantly played upon and moistened the feverish lips.

"You have traced me," said Adair. "It was a friend's business. I regret that I can offer you no hospitality."

"A couch and a chair," replied the Pole, looking round the miserable room, "and a scrap of looking-glass, and a picture of St. Somebody—female, however. Better men have been worse off. But, my brave Ernest, I never expected to see you again."

"Nor would you, Wolowski, had I not been robbed, and consequently been without the means—"

"Of bribery. Fie, is it thus you speak of old colleagues?"

"Of purchasing food," said Ernest Adair. "I am faint with hunger, or you should have had a longer chase, my friend."

"Actually hungry?" said Wolowski.

"Yes. I have scarcely tasted food for twenty-four hours. I did not mind it at first, but now the privation tells upon me. I am your prisoner."

"Nay, do not surrender until it is required of you. The weakest fortress expects the courtesy of a summons. But first let us throw provisions into the fortress."

And he handed a packet to Adair, which the latter tore open, and seizing some bread and meat ate them with an eagerness that excited the compassion of the Pole, cruel only as matter of business.

"It was well I thought of providing myself against a night in the open air," said the Pole. "Do not eat too hastily, however. And here, take my flask. I suppose you will not stab me while I am drawing the cork."

He handed a travelling-bottle to Adair, who, however, took but a small quantity, and returned it.

"You should have nothing to say against that liquor. It is from the cellar of the Silver Lion."

"I am restored, in some measure," said Adair, "and I am ready to accompany you, M. Wolowski."

"Thanks for the Monsieur, which you omitted before. It is a sort of grace after meat. But I have not come to arrest you. We leave duties of that kind, as you know, to inferior agents, which prevents unpleasantness afterwards, when people are released and meet as friends in society."

"You have not come to arrest me? Ah, but there are men round the house?"

"I will show my confidence in an armed man by telling him that there is not one. Now, do you meditate an attack upon me?"

"Why are you here?"

"That is a practical question, to which I will give you an answer later. That blow was struck well, Ernest, that blow in the drawing room."

"It was struck in defence of my own life."

"The master of the house arrests a robber, and the robber holds that he may kill the honest man."

"I was no robber. I came there to seek my own property, and I was watched and trapped. He entered the house intending to murder me, and he had all but succeeded when I saved myself with a blow."

"I am bound to tell you that the most unfavourable view will be taken of your case."

"That means that M. —— sacrifices me."

"Well, it is thought that to give up a first-rate employé of the police to justice would have a good effect upon the public mind, and therefore circumstances will be recalled, and on the whole your case is not an agreeable one."

"You know all," said Adair, "and will tell me what you please. I thought it possible that the Englishmen might wish to avoid a prosecution."

"The Englishmen have strange notions of duty, and have invoked all the vengeance of the law upon you."

"Regardless of the consequences."

"Regardless of the fact, strongly urged upon them by M——, that you will, when upon trial, make it a pleasure as well as a business to offer

Paris and London a story neither is likely to forget."

"They might have spared me, nevertheless," said Adair, under his breath.

"What is that *arrière pensée*, if one might ask?"

"No matter. But you do not tell me that I am a prisoner."

"My friend, your persistence in being a prisoner becomes monotonous. I repeat to you that you are as free as I am, so far as I know, and I add, that I have only a favour or so to ask, which you can refuse or not as you think proper."

"I am in exactly the position to make terms?"

"And am I in the habit of offering such things idly? But I make allowance for your excitement. I remember that the first time I had unfortunately an opportunity of experiencing similar sensations I was a good deal haunted by the incessant presence of a red tint which insisted on settling upon everything. I was younger than you are, however," added the Pole, "and imaginative, besides being slightly patriotic. You look really very much shaken—I have often dissuaded you from cognac, but try it now."

"No. I am strong enough."

"And wisely keep the brain unclouded, the better to judge of my offer. You are right. Now, attend. You had a great desire to visit England?"

"England! True," said Ernest, after a pause. "It seems an age since I was thinking of that."

"The age has passed, and brought the event nearer."

"You would send me to England!"

"You will go of your own will and accord, if you go at all."

"I am traced here, M. Wolowski, and I understand all the rest."

"Then use your comprehension, and do not raise subjects which it is useless to discuss. Suppose yourself in London."

"I tell you that I was robbed at a place where I lay down to sleep, and I am without a franc in the world."

"Excitement has enfeebled your usually lively imagination. The streets of London are paved with gold, as English clowns believe. At least you can imagine yourself there, and beyond the reach of want. I am not very wise, perhaps, in exposing my pocket-book to you, but there it is," and he laid it on the table near him.

"Ah! I am wanted for some desperate service. Is there another Silvestre in London?" said Adair, slightly shuddering.

"Not at present," replied the Pole, coolly. "My friend, it would seem that you are somewhat tigerish, and having once tasted—"

"Let us speak of your plans," said Adair, with much irritation.

"Decidedly tigerish," said Wolowski, looking at him quietly. "Change of air becomes a necessity for you. Well, do you accept the idea of an English sojourn?"

"What am I to do in England?"

"I have no more idea than yourself. Certainly, I do not think that it would be advisable for you, at present, to urge Mr. Aventayle, the manager, to the fulfilment of the engagement he seems to have promised. Your countrymen are said to be ferocious, and they like to see ballet-girls torn to pieces by lions on the stage, and to behold other frightful exhibitions, but there is a limit to their gladiatorial propensities. I do not think that in your *rôle* of an escaped assassin you would be acceptable to the insular mind."

Adair listened in silence.

"You agree with me? Well, but I can imagine that if it suited your arrangements to go to London, to find yourself a modest apartment in some quarter entirely removed from that in which wanderers from France and other happy lands chiefly congregate—for then, if there be another Silvestre, as you imagine, you will not encounter so unworthy an acquaintance—in this case English hospitality may not be disturbed by any interference of your colleagues."

"I am still one of you, then?"

"Why not? No offence has been proved against you, and as you are English, we will give you the benefit of the charming Anglican doctrine, which, if it were really practised in England, or elsewhere, would make society impossible. Consider yourself what you please. You will not be troubled with many orders from headquarters."

"You said that the Englishmen had invoked the law."

"Some invocations are not immediately answered, as you may possibly be aware. At all events, the law can answer at any time. Complete the picture I have suggested, and suppose yourself in some remote district in London, and passing, for the sake of decorum, under some other name than that which you have laboured, not in vain, to make famous. The name of your friend Silvain may serve as well as another."

"No, I will not take that," said Adair, quickly.

"It sounds pleasantly."

"It sounds like—no matter, I will not take that. Anything else will do as well. I will call myself by an English name—call me Hyde."

"I applaud the courage that can make a jest of one's condition at such a time."

"Jest—bah! It was the name of my mother. It is easily remembered."

"I will think of the park, of which you will be an ornament—that will do. Then, Mr. Hyde will have the kindness to take this card, and as soon as he has an address, he will forward it, with all care that it reaches its destination—to the gentleman here named. And Mr. Hyde will take care that when any message is sent to him, in reply, he is at home to receive it, and that he complies, in letter and in spirit, with any demand that may be addressed to him."

"Any demand?"

"Any," replied the Pole, changing his manner. "Do you comprehend?"

"Yes."

"There is money—there is the card—there is a passport"—replied Wolowski, abruptly, placing each in succession on the couch. "And one word more. Place your hands behind you," he said in a tone of command. "Clasp them together, and turn your back to me."

Adair obeyed, and the Pole held his hands together firmly, and said something in a fierce and hissing whisper.

"No need of menace," replied Ernest, angrily.

"Leave the room, assassin," said the Pole, releasing his hands, and pointing to the papers on the couch.

Adair gathered them up with deliberation, placed them in his pockets, and left the garret without even a glance at the other.

Laura's hand was all but on the door of her sister's house in London. She held under her arm the treasured volume, and she was about to knock, when she once more heard her name.

Ernest Adair stood before her.

"The dead man." Whether the words escaped her or not, this was the thought in that brief interval between the moment and unconsciousness.

"Go to Lipthwaite, Mrs. Lygon, and go instantly," said Adair.

Laura remembered no more, until she found herself in the arms of Beatrice.

(To be continued.)

THE FOURTH OF JULY, 1861.

Since the meeting of the extraordinary Congress at Washington, English people have begun to feel that the great scene of the second American Revolution is really unfolding, and that every day has been bringing on mighty issues, while we were complaining that nothing was being done. This is not the only nonsense that we have talked about an affair which we ought to have understood better. We are now perceiving how much more expedient it is to learn than to criticise; and, as events are marching now, we must be dull scholars not to get on fast.

The meeting of Congress on the Fourth of July is a singular incident in itself. The associations with the assemblage of the two Houses are of intolerable cold out of doors, and an oppressive artificial heat within, alternating with bitter draughts in the passages of the Capitol, and on the staircases of the boarding-houses. The bare trees in Pennsylvania Avenue stand iron-stiff in the frost. The pathways are sheeted with ice, or raised two or three feet by masses of hard snow. The daily banquets are gay, with the steaming dinners, the reviving wine, the vast furnace-fires of anthracite coal, and the abundance of warm light. The business going on in the Capitol is slight in quality and moderate in quantity, in ordinary times; there is plenty of amusement in flitting about to hear the best speakers; the balls are gay, and the session, from the 4th of December to the 4th of March, is a long winter holiday for the Congressional class of society. On the Fourth of July, on the contrary, they are all at their homes, except the Southern members, who have to flee to watering-places, from the fever of their own region. In town or country, among the orchards of New England, or the pine-barrens, or cotton-fields of the Middle States, the citizens rise to a hot day. From daybreak, when they get up to hang out their flags and load their cannon in the cool of the morning, till night when the fireflies stream from the sprays of the trees, like a cascade of green light, all is planned with a view to bearing the heat. City banquets, to celebrate Independence, are held in cool, shaded, breezy halls; and, in the country, the citizens meet in groves, or on lake sides, to enjoy oratory and ices, patriotic songs and fruit in the shade. This year, the scene was unlike any former celebration of the great day. The trees in Pennsylvania Avenue were in full leaf; and sun-blinds had replaced the warm curtains in all windows. The crowd to see the President pass to the Capitol were not muffled up, and blue and pinched, but rather sweltering in the heat, and undergoing "dissolution and thaw" for the sight which must be so memorable. In the Capitol the demand must have been for air and shade, instead of hot flues; and the somewhat dreary landscape from the top of the steps must have been softened by the verdure which many of the members had never seen there before. But there were greater differences. Far away in various directions were lines of camps, with their martial music and hum of voices celebrating the day. Instead of holiday festivity, consecrated by thanksgivings for the blessing of a glorious and prosperous polity, here was a meeting between the Executive Government and the Legislature, to announce to the world the disgrace and calamity of a great rebellion, and to take measures for carrying on a fierce civil war. The contrast between this and every preceding Fourth of July may well fix the attention of the world; and the utterances of the day could not but satisfy European observers that they have been over ready to criticise before they possessed materials for a judgment.

Some excuse for such a mistake is found in Mr. Seward's presence in the Cabinet. We have heard enough of Mr. Seward's speeches within two years as candidate for the Presidentship, as a retiring politician, and as minister, to have a decided opinion about both his honesty and his statesmanship; and we cannot but be prejudiced against any government which has him for one of its chief members. Thus far, criticism has been warranted, from whatever quarter it came; for it is impossible that a sensible politician or an honourable man could have changed his tone so often as Mr. Seward, or said such indefensible things. But it may be a question how far the President is censurable for having such a minister. Which of the rumours on this matter are true, or whether any of them, it is unnecessary to inquire. The thing that is generally understood on the spot is that Mr. Seward's presence in the Cabinet is a mistake, into which the President was led by intrigue; and that, of all Mr. Lincoln's anxieties, this is perhaps the greatest. It was known, many weeks ago, that there was difficulty in reconciling two parties in the Cabinet, represented by Mr. Seward and Mr. Chase. It now appears that Mr. Chase is strong in his position, clear in his aims, and, as always, steadfast and honest in his avowals. He may be taken as an exponent of the spirit and views of the government, while Mr. Seward may be regarded, I trust, as a temporary and mischievous accident.

Up to this meeting of Congress a deep obscurity hung over both the North and the South. Of the South next to nothing was known on the same continent till the letters of the "Times'" correspondent lifted the curtain here and there. A group of fugitive planters, every few days, might tell of the state of affairs in their own neighbourhood; and there were newspapers and manifestoes of the Confederate Government: but planters ready to fly were exactly the men least likely to be informed of Secessionist affairs; and the Southern newspapers are really unreadable—which they would not be if they contained genuine information. They are, as far as we can judge here, full of dreams and boasts, of virulent slander, and of lies prepared for a local or general public which must be humoured or led. From amidst this ugly haze, the "Times'" correspondent has brought out groups of clear facts from which it is possible to derive some definite impressions and anticipations. The effect of the series of letters is undoubtedly to satisfy people in general that the Confederacy cannot succeed, if the Federal Government decides that it shall not. Throughout the North this will be learned for the first time through the Englishman's correspondence with home; and we may expect to see one effect of his disclosures in the homage which will now be paid him in places where very rash and insulting things have been publicly said of him, merely because he went to see the South with his own eyes. It showed a sad want of self-respect in certain Northern citizens to assume that to see the South must be to advocate its cause; just as it was, more recently, to fancy that because England would not take sides with the North, she must be "aiding and comforting" the South. Such incidents show that the Free States have been much like Europe in their ignorance of the actual plans, operations, and resources of the Confederacy.

Almost as great an obscurity hung about the Federal Government till the Fourth of July. I need say nothing here of the folly of complaining of the President for his apparent slowness, as long as there was no evidence of irresolution. Everybody now admits,—as one consequence of some grievous accidents to the Federal forces,—that a trustworthy military organisation cannot be made out of a crowd of civilians in a day, or a week, or a month. There was no due supply of officers; and they cannot be had for the asking. When the great converging forces began to move southwards, the world began to see what General Scott and the Government had been doing; and perhaps we may end in wondering how so much could have been effected in so short a time. This march into Virginia, after Washington was secured, revealed the action and intention of the War Office; and at the same time, the frank explanations of the President and the Finance Minister have made all plain as to the policy of the Government, and the means which it is proposed to employ.

What we may be said to know, then, is that the Secessionist public are still in a state of delusion about the prospects of their cause, imagining that England and France will either sustain it, or prevent any disastrous results of the conflict: that the Southern public is still deceived about the amount and quality of force that the North has produced: that the Southern troops are not well furnished for the war; nor disposed for the discipline which their commanders know to be necessary: and that poverty presses hard upon large sections of society in the Slave States, where the citizens' resources are drawn from them without any prospect of being replaced. They give their cotton and tobacco to the Confederate Government for paper acknowledgments, which serve as currency now, and are to be redeemed some time or other: but there is nothing to sell, and nothing to buy; no prospect of an income for anybody, heavy taxes to pay, and the land producing less than ever before, because those who should look to it are gone to the wars, or fugitives to the Free States. If the Confederate leaders are more able than they at present appear to sustain the conflict they have provoked, a little time will show it. At present, nobody believes that they can stand their ground.

One cause of this impression is the character of the war which they wage. It is not warfare, but assassination. It seems to be copied from the Indians, whom they have mixed with their force;—fellows whose notion of war is brandishing their long knives in the streets of Fredericksburg by day, and skulking at night to destroy as many enemies as possible in detail. All through New England there are households mourning the loss of some son or brother who has been murdered at his post in the dark, without a chance of meeting his enemy. There must always be danger of the infection of this mode of warfare spreading through revenge; and there has been one striking instance of this already on the Northern side. A citizen has been so moved by the lynching of a brother in one of the Slave States, where the young man was hanged, under circumstances of cruel aggravation, merely for his Northern birth, that the thirst for revenge seems unquenchable. The survivor is described as incessantly on the watch to kill somebody in the Confederate camps; and as reckoning up his number as he would account for the business of his life. This seems, however, to be a single instance; and the Northern notion is of fighting battles in open field in broad day, and pressing the enemy southwards by the steady advance of weighty forces.

The question of success manifestly depends on the proportion of the Union party to the Secessionists in the Slave States. It remains true, as it has been from the beginning, that if the Federal Government is right in its estimate of the Union sentiment which exists in every State, there can be no doubt of the issue: and all controversy as to the event must turn on the soundness or unsoundness of that estimate. No sensible person in any foreign country will pretend to be able to form a judgment upon it, while the only public evidence is the flight of planters to the Free States, and the only testimony that which they bring with them from their neighbours. The truth will be known when the Federal forces render it safe for Union men to declare themselves; and not till then.

One of the strangest characteristics of the re-

spective antagonists is their way of raising means for their struggle. The Confederate authorities rely on getting an opportunity of selling the cotton and tobacco they have collected as tribute: but this mode of taxation was not resorted to till they had got all they could by direct levies and confiscations, and seizure of debts due to the North. They advocate direct taxation with a vengeance though as far as can well be from liking democratic government. Their rule has always been oligarchical and extremely despotic; yet their mode of taxation is the most direct that can be seen anywhere in the world. Meantime, in the democratic North, the Finance Minister brings forward a scheme of an opposite character, and there are still champions of the Morrill tariff. This latter production,—the creature of ignorance and cunning,—will soon be beyond the reach of argument. It is remarkable; and perhaps it required an absurdity as great as this to rouse the mercantile class and the consuming public to resistance to the class legislation of the manufacturers: but it will remain on record as a proof of the backward state of political economy among an enlightened and business-like people. It really seems as if nobody was qualified to check the nonsense that is talked by the promoters of the most suicidal commercial scheme of modern times; for the public takes no effectual notice while desperate injuries are inflicted on trade, and has no correction ready for journalists who write about it without any idea of the bearing of what they say. While such a thing can be, it is no wonder that Mr. Chase proposes a scheme in which direct taxation bears a very small share. The Morrill tariff was made foolishly unproductive by the protection to native industry being made to depend more on obstruction in the Custom House than amount of duty. Its advocates think they have defended it perfectly when they show that there are articles on which the duty is not so high as in former tariffs; and they either do not see, or do not wish their neighbours to see, that it is the amount of obstruction of any kind, keeping out foreign commodities, which constitutes the prohibition, and not necessarily the one impediment of a high duty. Nobody gains, however, by the waste of time and toil which the Morrill tariff imposes; and if the prohibition of foreign manufactures is determined upon, it is a pity that the Government should not have the benefit,—dearly bought as we know it would be—of high duties, rather than that everybody's temper should be tried by the most singular aggregate of inconveniences that could be devised. It pays nobody that the duty should be charged in part by weight, and in part *ad valorem*. It profits nobody that merchants and officials should be for ever unpacking and repacking goods in transit, and counting threads, and measuring inches, and weighing and computing till nobody has any temper left. A heavy duty would be better for the Government, and no worse for seller, shipper, and buyer. But then the champions of the tariff could not defend it for being, and for not being protectionist, at the same time.

Heavy duties on coffee, tea, and sugar come under another head, as those commodities do not compete with any Northern products; and it may be as well to have more than one method of taxation. Taxes on exotic commodities are not altogether indefensible in a democratic republic, as protective duties are. But it does seem strange that so little attention appears to be directed towards a method of direct taxation which seems to be actually required by republican principle. It may be very true that the South may be made to pay by Customs duties, while no kind of direct taxation could at present be enforced. This may justify the tea and coffee duties; but it remains evident that the readiest, fairest, completest, and most democratic method of taxation is an income tax for the twenty millions of Northern people. Yet the idea seems not even to have been considered by anybody there. Perhaps one of the ultimate gains of the war,—again reaped from its losses,—may be that political economy may obtain some attention. I am aware that it is professed in colleges, and written about by antagonists of Ricardo, Malthus, and Adam Smith: but the history and mystery of the Morrill tariff, passed in April, and followed by the war budget of the Government in July, are enough to show how much American society has to learn in the economical province of its politics.

Open, manifest, indisputable above everything, is the noble spirit of the people at large, now that the first burst of enthusiasm would have been over if it had not been genuine, and at the moment when the whole significance of the war is disclosed. They know now what loss or ruin of fortune most of them must incur: they have felt something of the toil and privation of military service; and the amount of needless, wanton, exasperating slaughter might well sicken the general heart. Yet there is no flinching. The President's call for 400,000 men is met as eagerly as his prior call for 75,000. When he asks whether they will raise 80,000,000*l*. for the national service, they say "O yes," as if he asked for 80,000*l*. When the old family tombs of the Forefathers are opened, to admit the coffin of some gallant representative of each, the next brother starts off for the battle-field, as soon as the "Amen" is said over the grave. The betrothed girl waves her handkerchief with a smile as he who should have been her husband next week marches past for the South, and faints away when he is past the corner. The aged mother paces her room for hours, when she is weary of making lint, and finds her Bible brings the tears too fast. Except a very few cowards, traitors, and sordid trimmers, who try to raise a call for compromise, there seems to be no defection from this splendour of patriotism. This is the broadest, plainest, weightiest, and most brilliant fact of all that strikes the eye.

Meantime, there is something behind, deep in the shade, almost shrouded in silence, yet occupying intelligent people more than all the rest together; something which we long to know about, and on which at last we can gather some light, if we try. What about the negroes? Slavery left a great flaw in the original Republic. Slavery has prevented half the States from ever being republican at all; slavery bred the antagonism which has issued in this war; and the

fate of slavery avowedly depends on this war. What, then, is doing about slavery?

There is an almost total silence preserved at Washington about it; but that is easily understood. While it is the uppermost thought in the minds of all who bear a share in the responsibility of governing the country, it is a subject of which they can take no notice in Congress, lest a rising of the slaves should be induced by it. Owing to the imprudence of Southern orators, the slaves everywhere know that the war is somehow on their account, and that the question is of their emancipation. The newspapers of all the States tell of the expectation of deliverance which is prevalent among the negroes—the "great man coming" who is to make them all free. Any mention of them in the President's Message, any discussion of their case in Congress, would probably be followed by insurrection, such as it has always been the desire of all parties (except a handful of followers of John Brown) to preclude. Yet something must be settled as to what is to be done with the negroes set free by the advance of the Federal forces. It is clear that slavery can never exist again on the ground which the Republicans have passed over. Some of the Virginia masters have sensibly emancipated their negroes at once, though how they are to settle accounts with the law of Virginia remains to be seen. From some of the estates the negroes repair to the Federal forts and armies; and the authorities report that they have come in—men, women, and children—by hundreds; that they are working well, behaving well, and exceedingly happy. They are employed in field works and the service of the camps, and are paid as ordinary labourers. It is observable that the officers are surprised at the intelligence of these people, and at their accurate understanding of the movement by which the South has been pleased to bring the slavery question to an issue. So far so good; but there are *millions* of these people. If the educated and substantial planters were the managers of the Secession movement, it might be hoped that they would do the sensible thing, and use the occasion for converting their negroes into hired labourers; in which case they would retain most of them in their service, and gain rather than lose in fortune. But the Secession leaders and agitators are, for the most part, men of a lower social standing, jealous of the planters, and suspicious of their loyalty to the Confederacy. That *they* will promote in any sensible way the now inevitable emancipation is not to be hoped; and this throws a great charge on the Government and the Northern citizens. While silent, for the enemy's sake, the Northern men have to provide for the employment and maintenance of any number of negroes who may apply to them. At present the numbers are manageable, because there are plenty of hogs, poultry, and corn-cobs on the estates deserted by the planters and overseers—some of whom are in the one army and some in the other; but, when the provisions are eaten, when cold weather comes, when war has swept over the plantations, or when there are rumours of the overseer and the whip coming back, the whole negro population will betake itself to the delivering force. It is not difficult to see that the Government is looking forward to what must happen so soon; and it is cheering to observe the cordial readiness of all parties and persons to aid the Government, and discourage any action which could embarrass it. There has been no move to excite the slaves, though bands of mounted men could raise them any day, by merely riding in among them. The wish of the Government, that emancipation should simply accompany the march of the armies, has thus far been respected; and the citizens who remain at home are busy in providing for the disposal of the released negroes. It is not a new task; for the number of fugitives has been on the increase for many years, till it has risen from tens to thousands; and there is now a new prospect opening. While negro slavery existed, the best of the free negroes refused to leave the country, because they would thereby lessen the chances of obtaining the rights of humanity and citizenship for their enslaved brethren. Hence the failure of many schemes of colonisation, from the opening of the century till now. But, now that slavery is obviously near its end, the objection is loosening. The brightest and best of the free negroes, the educated men, the merchants, and capitalists, will, no doubt, stay where they are. So, probably, will the larger proportion of labourers in the cotton and tobacco States, if the planters have the good sense to make reasonable terms with them. But a very large number will remain, eager to settle under new conditions. A very large number are in Canada now; and many are growing cotton in Hayti. The Washington Government and its advisers will take timely care that opportunity is provided for the settlement of any number that may present themselves: and they are busy about it now.

They have every encouragement in the behaviour of the negroes. We know, by the strong and reiterated testimony of the "Times'" correspondent, how depressed is the mood, and subdued the bearing of the slaves. In the first days of freedom, their exhilaration is in proportion; but they show no sign of vindictive passion. It is only in despair that negro slaves have done anything cruel. Their exaltation of mind is extreme in this crisis; but in behaviour they are docile. When the Massachusetts regiment, which had lost two men in Baltimore, marched down, the day after, into a slave-holding district, some of the men, curious to know how they were regarded, asked an old negro woman what was thought of them and their arrival. Her instant reply was:

"You are Jesus Christ to us; come to shed your blood for us."

The body of one of their murdered comrades was with them; and these words brought tears to many eyes unused to shed them. The anecdote got into the Southern newspapers, where the tears were treated with mockery; but it is a grave season when sons of the Puritans, a reserved and tearless tribe, are so moved by a voice from an enslaved race.

On the whole, the indications appear to be that the great peril of all,—that of a servile war,—seems to be lessening as the civil war proceeds. The Secessionists, claiming to speak for the South,

have chosen to commit their "peculiar institution" to the chances of civil war; and it is already evident that nothing short of a conquest of the Free States by the South could save the institution. The day will come when the men and women of the South will appreciate what the Federal Government is doing now, in rendering safe that abolition of slavery which is the haunting terror of their lives.

From the Mountain.

"BELL'S LIFE," AND OUR SPORTS AND PASTIMES.

It is marvellous how little we know of each other in this England of ours in the year of grace, 1861. In common with most middle-aged quiet gentlemen, who have done a little poetry in their time, and have lamented in passable verse the merry days of old, I have lived in the belief that we were fallen upon evil days, when "All work and no play makes Jack a dull boy." Our working population have the character, throughout Europe, of being a dull heavy people, in whose highlows the elastic spirit of sport no longer treads. Well, firmly fixed in this opinion, and no more doubting it than I did that Robin Hood of old killed a Sheriff of Nottingham every other month by way of pastime, I was suddenly brought one morning into the companionship of a deal table, two official-looking chairs, and a "Bell's Life," in an out-of-the-way station of the Eastern Counties Railway. Now, I had often seen this paper before, but as "the fancy" lay out of my beat, I might be said to have seen it and not seen it, and it is wonderful how much of this kind of double-sight we manage to get through in the course of a day. But how could one help seeing a paper of any kind, with nothing to look at for two mortal hours but a highly coloured picture of a gigantic mangold wurzel, meant as an advertisement to astonish the agricultural mind? At all events, I sat me down to have a spell at "Bell's Life." When a man suddenly lifts up a flat stone, it is wonderful the amount of active life, before hidden to his sight, he sees skirmishing about in all directions. Just such a picture of active life opened to my benighted vision, on turning over the pages of this newspaper. Why, what has become of the dull boy, Jack? Is this the individual, I asked myself, whom I find running, racing, diving, swimming, boating, yachting, leaping, fighting, sparring, wrestling, shooting, ratting, dog-fighting, knurring and spelling, cricketing, quoiting, racketing, &c., &c.? Why, what has come to the dull boy? To read the papers he would seem suddenly to have gone crazed. But, no; the station-master draws my attention to the fact, that this paper has been going on for nearly a third of a century, and all the while its pages have presented to its readers the same astounding reflection of the vigour, agility, and desperate energy of the sporting world of England. There is spring and go in old England yet, is the mental reflection which every man must make as he reads and wonders. Even the Londoner cannot be so degenerate an animal when we read what he does. Why, he takes the shine out of the lithe Indian, even on his own ground. In this very page I read that a Cockney was lately pitted against two celebrated North American Indians in a ten miles run at New York, and beat them all to nothing. And what surprises me most is, that the clean running of the Londoner was contrasted by the lookers-on with the lollopping, awkward gait of the sons of the forest. St. Giles showing its heels to the fleet savages of Delaware! What next!

But when one analyses the contents of these pages, the curious aspects of sport that exist among us comes out still more strongly. As I have touched upon the question of running, let me examine the column appropriated to matches to come off. In a recent week's (July 7th) paper under this head there are no less than sixty-nine pedestrian matches to be contested, and these under every conceivable condition of length, &c., from a hundred and fifty yards to four miles, and some with the addition of having to jump a thousand hurdles! For every one of these races the men have to go into training, to sweat down superfluous fat by walking daily long distances in half a dozen top-coats, under the severe and somewhat monotonous nourishment of mutton chops only—why, martyrdom was often won by the saints of old at less physical suffering than these men undergo—for a paltry 10*l.* stake. To read the accounts of these matches, the reader would think that it was some description of a menagerie he was perusing. "The American Deer looked up to his work;" "the Barnsley Antelope seemed in excellent condition;" or "the London Stag had not an ounce of superfluous flesh." So earnest are all concerned in the physical qualifications of the competitors, that the man is completely sunk in the contemplation of his animal functions.

Under the heading of "The Ring" the engagements and the events to come off are so numerous, that one naturally asks where are the police? How is it that thousands of persons can congregate in the open fields, week by week, for an unlawful purpose, without any of these gentry knowing anything about it; or if they do, to find they are actually defied. In the great fight between Sayers and Heenan they were kept out of the ring simply by the spectators closing up, and preventing their getting through. The explanation is, that it is impossible to legislate against any large class of people without their consent. The Ring is still an institution of the country, declining no doubt, but it cannot be said to be defunct so long as eighty members of the lower house can be found, as in the great international fight, to patronise it. The P. R. understands that it has its duties as well as its rights; there are members of the P.R.B. Society, an institution to afford relief to decayed bruisers and their families, and there are many societies, with much higher sounding titles, whose members subscribe according to their means with much less liberality.

We all know that the P.R. possesses a phraseology particularly its own, but a little study of "Bell's Life" gives us an insight into the social habits of this unique community. Shakspere says that he who dislikes the harmony of sweet sounds is only fit for stratagem and strife, but my "Bell" tells us a very different story.

The prize-fighter's crib is the very soul of harmony, if we may believe their advertisements. Thus, Professor Mike Madden assures his friends that the "merrie little Bell is always in tune, and everything goes on right merrily every evening." Whilst Jem Mace (champion of the world) states "that he will hold a conversazione this evening, July 6th, in the new picture-gallery," the said picture-gallery consisting of portraits of pugilists. By the way, I may mention that no sporting publican thinks his bar complete without one of Newbold's pictures of the set-to between Heenan and Sayers, the possession of which is always advertised. "At Nat Langham's, Cambrian, Castle Street, Leicester Square," we are informed, "that the usual scenes of tranquil delight are enacted every evening with gorgeous effect." Who shall say after this that the converse of Shakspere's proposition is not true? Of course such national sports as racing and cricketing are fully and minutely reflected in "Bell's Life;" but even here the reader is surprised to find the number of events that are coming off day by day, in the former sport especially. It is remarkable the number of collateral occupations to which it gives rise. There is generally a column of advertisements of racing prophets, each vieing with the other as to their infallibility.

These horse-wise men dispense their predictions to regular subscribers at so much per season or quarter, a striking proof of the depth to which speculations on the turf have penetrated every section of the British community. Swimming is I find gradually asserting itself as a national sport of the first magnitude. There is a champion swimming belt, and Beckworth, the champion, advertises the graceful swimming and floating feats of his daughter, Miss Jessie, aged seven years, and the babies, F. and W., aged five and three years. As if the element he performed in did not furnish sufficient difficulties to the pursuit of the art, one professor attempted to perform the feat of jumping into seven feet of water from a height of ninety feet, and when in mid air firing off two pistols, jumping through two balloons, and, whilst under the water, putting on a pair of trousers! The oddest games and contests are to be found in the pages of "Bell's Life." For instance, what does the reader know of the game of Knurr and Spell? Yet this sport also has its professors and players devoted solely to it. We believe it is a kind of scientific trap-and-ball game. A Mr. Tupper (not Martin Farquhar) has given a challenge, which has been accepted, to match his donkey to make the best of his road for two miles against a runner. A most exciting match will, we hear, speedily come off between Lord ———'s horses and the hounds of Lord ———. Running matches between dogs are, we find, a matter of everyday occurrence. Pigeon flying is a great sport among the Birmingham fancy, and dog and cock fighting (the latter, a stage of sport beneath the dignity of "Bell's Life" to chronicle), are still rife in the last-named stronghold of the "fancy." Among the more sedentary games I find matches are continually coming off. A young man challenges the world to play a game of draughts with him; even dominoes have their triumphs registered in these omnivorous pages. And be it remembered, with every season the readers have an entire change of performances. Indeed, scarcely a month goes by without witnessing an entire alteration in the nature of the sports.

It will be observed, however, that with the exception of field-sports or yachting, trials of skill, strength, agility, and endurance are not made in the public eye. Trials of skill in running, leaping, wrestling, &c., are generally made in professional grounds, into which "society" enters not. Our athletes are either professionals or plebs from the shop—the butcher, the baker, and the shoemaker, who exert themselves for money, &c. The snip who brings home your coat, for all you know, is recognised among his pals as the Brompton Stag, or the young butcher may be famous among the fancy as the great hurdle-leaper, or the baker boasts the best dog at a rat in the parish. Their triumphs are unnoted except by the publicans where the matches are made up and their proceeds spent. The other class of men who are fond of sporting are the officers of the army; they have leisure and money, and their profession gives them a strong leaning toward physical exercises. But the great middle class have not hitherto been given to sports—at least, not to contend in any public arena for honours or rewards. This has been the great want of the young men of the counter and of the desk; their wits have been, of late, fostered at the expense of their muscles. Athenæums and mechanics' institutes have been favoured to the total exclusion of athletic and manly games, and this is the reason why the idea exists that our old sports and pastimes have died out. I have shown how far this is from being the case among the upper and lower classes, and there are very evident symptoms that the great middle classes are beginning to move in this direction. To the Volunteer movement this amendment in our public life is clearly due. The drill grounds attached to most corps throughout the country are centres of gathering for our youth, which they have not been slow to take advantage of. They have fostered in our citizen-soldiers a love for out-of-door life that was utterly wanting for a century at least. The very monotony of the drill itself has led to the practise of athletic games; and not a fortnight since, at Beaufort House, the South Middlesex ground, the palm of victory was contended for in our old English games at a fête in which there were thousands of fair women to look on and applaud. The *esprit de corps* produced by these regimental gatherings are likely to foster this growing love of our national games. By-and-by, corps will play against corps, and we shall be as proud of our crack runners and jumpers in our regiments, as we are of our prize shots. And, be it remembered, these sports will be carried on under the eyes of fathers and mothers, brothers and sisters; all the best influences of the family will be brought to bear upon our games, and a far healthier influence will pervade our sports, thus carried on in the light of day, than we find at present, when the house of call of the athlete is a public house, and our contests are adulterated

with a certain blackguardism, inseparable from them so long as they are chiefly participated in by the lowest class of the population. "Bell's Life," we predict, will ere long be the record of the athletic sports of the youth of the middle class, as represented by our Volunteers, and when such is the case, it will truly represent all classes in the country, and will be as true a reflection of sporting life in England in its entirety, as the "Times" is of its political life. A. W.

THE TURKISH ALMANAC (TAKVIM).

The Turks, the youngest of all the Eastern nations, though they have now been for centuries in continual intercourse, political and commercial, with all the countries of the civilised world in and out of Europe, have, nevertheless, preserved to this day, in all their integrity, all the ancient prejudices and popular traditions of their race, and to which they still adhere with a pertinacity that neither time nor the frequent attempts at civilisation have, in the least, been able to modify. Even their common almanac (Takvim) shows how widely the Turks still differ from us in their views and notions of even common life relations, and no wonder that the Turkish astronomers direct their attention chiefly to the gratification of the popular taste in the daily wants, wishes, dealings, and requirements of practical life generally. The Takvim is thus the household book of the common people, and embraces all sorts of moral, social, religious, and even sanitary precepts, in a national point of view.

The very clumsy size and form of the Takvim speaks already of a different taste even in *book-making*, its width being about four inches, while the length measures upwards of six and a-half feet! The top of the inside is adorned with various pictorial illustrations of stars, crescents, spheres, telescopes, arms, standards, &c. These are followed by an astronomical account, written in a truly pathetic style, of the exact time when the sun is to pass the equinoctial line, and having reference to the respective eras as computed by the Copts, Greeks, and Arabs. Next comes the astronomical calendar, commencing with New Year's Day (Nevruz). It is introduced and prefaced by some religious hymns and blessings on the heads of the orthodox believers. Then follow—from right to left—the old Turkish signs of the zodiac, with their Persian names: swine, dog, ox, leopard, crocodile, serpent, monkey, sheep, rat, horse, hen, and hare. Next come—from left to right—our Christian signs of the zodiac, with their Arabian names, as also of those of the sun, moon, and planets.

The Takvim is divided into twelve parts, under the following headings:—1. Remarkable days; 2. Days of the week; 3. The Arabian era; 4. The Greek era; 5. Dominant constellations; 6. Hour and minute of sun-rise; 7. Mid-day prayers; 8. Afternoon prayers; 9. Evening prayers; 10. Morning prayers; 11. New moon; and 12. Miscellaneous.

We will select a few items for the month *Moharrem* (first month of the year), which begins on the 23rd of our February month.

1st day.—The moon rises in the north, high and bright.
3rd ,, The second heat descends into the water.
5th ,, Storks arrive.
10th ,, *Ashorday.* (On that day the benevolent prepare from all sorts of fruit a dish called *ashor*, which they distribute amongst the poor.)
11th ,, The third heat descends to the earth, and the two seasons separate. The strength of winter is broken, and any subsequent severe cold is of no duration.
14th ,, Rushes begin to sprout forth.
16th ,, The old *women-winter* [?] commences.
19th ,, First of March, old style.
20th ,, Wood-pigeons make their appearance, and the old *women-winter* is at an end.
27th ,, The silk-worm season begins.

In part 6 we read:—

As the sun always sets at twelve, the hour for evening prayers remains unchanged; but it varies with that of sunrise, which is not always the same!

The last part, Miscellaneous, contains things that are to be done on certain days in the month.

1st day.—Visit cheerful society.
2nd and 3rd are auspicious days.
4th day.—Pay your respects to the great of the state.
5th ,, Learn music.
6th ,, Seek for the learned.
7th ,, Buy male slaves.
8th ,, Ordinary day.
9th ,, Portion your daughters.
10th ,, Engage in business.
11th ,, Work in gold and silver.
12th ,, Engage in maritime undertakings, in building wharves, docks, &c.
13th ,, Gladden the hearts of the needy.
14th ,, Converse with the wise.
15th ,, Prepare essences.
16th ,, Prepare electuaries.
17th ,, Avoid travelling or ascending mountains.
18th ,, Pay your respects to the ministers of state.
19th and 20th are lucky days.
21st day.—Visit the pious.
22nd ,, Give your company to your wives.
23rd ,, Buy landed property.
24th ,, Keep quiet at home.
25th and 26th are lucky days.
27th day.—Engage in commercial speculations.

M.

THE MILL-FIEND.

Come, let us go down from this weather-stain'd hill—
One, two, three, and away!
Go down to the hollow where glassy and still
The mill-race rolls over the wheels of the mill,
And its foam is the dew of the morning.

There are two bonny eggs in a nest on the hill—
One, two, three, and away!
One lies in the warmth of its mother-bed still,
But the other is rolling adown to the mill—
For the winds are so wild in the morning.

Two children are playing atop of the hill—
One, two, three, and away!
One clings to the peace of its infancy still,
But the other is off and away to the mill,
To see how it looks in the morning.

Two lovers are wed at the church on the hill—
One, two, three, and away!
She lights up his home, and is true to him still,
But he hurries down to the rear of the mill,
And thinks not of her or the morning.

Two weary wayfarers come over the hill—
One, two, three, and away!
One makes for the cottage that's dear to him still,
But the other strides on to get work at the mill,
And stays not to look at the morning.

Two friends are in talk on the brow of the hill—
One, two, three, and away!
One sleeps, but the cool grass is over him still,
While the other is whirl'd round the pool of the mill,
And his corpse will float up in the morning.

Two spirits fly over the cross on the hill—
One, two, three, and away!
One stays there and prays there and watches there still,
And the other, who writhes in the teeth of the mill,
Is Lucifer, son of the morning.

Arthur J. Munby.

THE ALIBI.

A REAL EXPERIENCE.

I wholly disbelieve in spirit-rapping, table-turning, and all supernatural eccentricities of that nature. I refuse credence to the best authenticated ghost story (mind you, *ghost* story *pur et simple*).

I can sleep in the gloomiest haunted room in the gloomiest haunted house, without the slightest fear of a nocturnal visit from the other world.

But, although I scoff at white ladies, bleeding nuns, *et hoc genus omne*, there is a species of supernatural occurrence in which I am, I confess, an unwilling and hesitating believer.

The circumstances I am about to relate are of this nature, and were told me by an intimate friend of mine, as having lately occurred to a relation of his own.

I give the story as he gave it to me, namely, in the words as nearly as possible of the principal actor in it.

Two years ago, towards the end of the London season, weary of the noise and bustle that for the last three months had been ceaselessly going on around me, I determined upon seeking a few days' rest and quiet in the country. The next evening saw me comfortably installed in a pretty farm-house about two miles from the cathedral town of X——. The little cottage in which I had taken up my quarters belonged to an old servant of my father's, and had long been a favourite resort of mine when wishing for quiet and fresh air.

The evening of the second day after my arrival was unusually close and sultry, even for the time of year. Weary with the heat, and somewhat sated with the two days' experience I had enjoyed

of a quiet country life, I went up to my bed-room about half-past ten, with the intention of taking refuge from the *ennui* which was growing on me, in a good long night's sleep. Finding, however, the heat an insuperable obstacle to closing my eyes, I got up, put on my dressing-gown, and lighting a cigar, sat down at the open window, and dreamily gazed out on the garden in front of the cottage. Before me several low flat meadows stretched down to the river, which separated us from the town. In the distance the massive towers of the cathedral appeared in strong and bright relief against the sky. The whole landscape indeed was bathed in a flood of light from the clear summer moon.

I was gradually getting sleepy, and beginning to think of turning in, when I heard a soft, clear voice, proceeding apparently from some one just beneath my window, saying,

"George, George, be quick! You are wanted in the town."

I immediately looked from the window, and although the moon still shone most brilliantly, somewhat to my surprise I could see no one. Thinking, however, that it was some friend of my landlord's, who was begging him to come into the town upon business, I turned from the window, and getting into bed, in a few minutes was fast asleep.

I must have slept about three hours, when I awoke with a sudden start, and with a shivering "gooseskin" feeling all over me. Fancying that this was caused by the morning air from the open window, I was getting out of bed to close it, when I heard the same voice proceeding from the very window itself.

"George, be quick! You are wanted in the town."

These words produced an indescribable effect upon me. I trembled from head to foot, and, with a curious creeping about the roots of the hair, stood and listened. Hearing nothing more, I walked quickly to the window, and looked out. As before, nothing was to be seen. I stood in the shade of the curtain for some minutes, watching for the speaker to show himself, and then laughing at my own nervousness, closed the window and returned to bed.

The grey morning light was now gradually overspreading the heavens, and daylight is antagonistic to all those fears which under cover of the darkness will steal at times over the boldest. In spite of this, I could not shake off the uncomfortable feeling produced by that voice. Vainly I tried to close my eyes. Eyes remained obstinately open; ears sensitively alive to the smallest sound.

Some half-hour had elapsed, when again I felt the same chill stealing over me. With the perspiration standing on my forehead, I started up in bed, and listened with all my might. An instant of dead silence, and the mysterious voice followed:

"George, be quick! You *must* go into the town."

The voice was in the room—nay, more, by my very bed side. The miserable fear that came over me, I cannot attempt to describe. I felt that the words were addressed to me, and that by no human mouth.

Hearing nothing more, I slowly got out of bed, and by every means in my power convinced myself that I was wide awake, and not dreaming. Looking at myself in the glass on the dressing-table, I was at first shocked, and then, in spite of myself, somewhat amused, by the pallid hue and scared expression of my countenance.

I grinned a ghastly grin at myself, whistled a bit of a polka, and got into bed again.

I had a horrible sort of notion that some one was looking at me, and that it would never do to let them see that I was the least uneasy.

I soon found out, however, that bed, under the circumstances, was a mistake, and I determined to get up, and calm my nerves in the fresh morning air.

I dressed hurriedly, with many a look over my shoulder, keeping as much as possible to one corner of the room, where nobody could get behind me. The grass in front of my window was glistening with the heavy morning dew, on which no foot could press without leaving a visible trace.

I searched the whole garden thoroughly, but no sign could I see of any person having been there.

Pondering over the events of the night, which in spite of broad daylight and common sense, persisted in assuming a somewhat supernatural aspect, I wandered across the meadows towards the river, by a footpath which led to the ferry. As I drew near to the boatman's cottage I saw him standing at his door, looking up the path by which I was approaching. As soon as he saw me, he turned and walked down to his boat, where he waited my arrival. "You are early on foot my friend, this morning," said I, as I joined him.

"Early, sir," answered he, in a somewhat grumbling tone; "yes, it is early, sir, and I have been waiting here for you this two hours or more."

"Waiting for me, my friend—how so?"

"Yes, sir, I have; for they seemed so very anxious that you should not be kept waiting; they have been down from the farm twice this blessed night, telling me that you would want to cross the ferry very early this morning."

I answered the man not a word, and getting into his boat, was quickly put across the water. As I walked rapidly up towards the town, I endeavoured to persuade myself that somebody was endeavouring to play a silly hoax upon me. At last, stopping at a gate through which I had to pass, I determined upon proceeding no further. As I turned to retrace my steps, suddenly the same shivering sensation passed over me—I can only describe it as a cold damp blast of air meeting me in the face, and then, stealing round and behind me, enveloping me in its icy folds.

I distinctly heard the words "George, George," uttered in my very ear, in a somewhat plaintive and entreating tone.

I shuddered with a craven fear, and turning hastily round hurried on towards the town.

A few minutes' walking brought me into the market-place. It was evidently market-day, for in spite of the early hour there was already a considerable bustle going on. Shops were being opened, and the country people were exposing

their butter, poultry, and eggs, for sale, and for about two hours I wandered amongst the busy and constantly increasing crowd, listening to every scrap of conversation that reached my ear, and vainly endeavouring to connect them with the strange summons that had roused me from my bed, and led me *nolens volens* to the town.

I could hear nothing that interested me in any way, and feeling tired and hungry, I decided on breakfasting at the hotel, which overlooked the market-place, and then taking myself back to the cottage, in spite of the mysterious voice.

The cheerful and noisy bustle of the market had indeed partly dissipated the morbid turn which my fancies had taken.

After I had breakfasted I lit my cigar, and strolled into the bar, where I talked for ten minutes with the landlord without elucidating anything of greater moment than that it was his (the landlord's) opinion that things were bad—very; that Squire Thornbury was going to give a great ball on the occasion of his daughter's approaching marriage; and that Mr. Weston's ox was certain to carry off the prize at the next Agricultural Meeting.

I bade him good morning, and turned my steps homeward. I was checked on my way down the High Street by a considerable crowd, and upon inquiring what was the matter, was informed that the Assizes were being held, and that an "interesting murder case" was going on. My curiosity was roused, I turned into the court-house, and, meeting an acquaintance who fortunately happened to be a man in authority, was introduced into the court, and accommodated with a seat.

The prisoner at the bar, who was accused of robbing and murdering a poor country girl, was a man of low slight stature, with a coarse brutal cast of features, rendered peculiarly striking by their strangely sinister expression.

As his small bright eyes wandered furtively round the court they met mine, and for an instant rested upon me. I shrank involuntarily from his gaze, as I would from that of some loathsome reptile, and kept my eyes steadily averted from him till the end of the trial, which had been nearly concluded the previous evening. The evidence, as summed up by the judge, was principally circumstantial, though apparently overwhelming in its nature. In spite of his counsel's really excellent defence, the jury, unhesitatingly, found him "guilty."

The judge, before passing sentence, asked the prisoner, as usual, if he had anything further to urge why sentence of death should not be passed upon him.

The unfortunate man, in an eager excited manner, emphatically denied his guilt,—declared that he was an honest, hard-working, travelling glazier—that he was at Bristol, many miles from the scene of the murder on the day of its commission,—and that he knew no more about it than a babe unborn. When asked why he had not brought forward this line of defence during the trial, he declared that he had wished it, but that the gentleman who had conducted his defence had refused to do so.

His counsel, in a few words of explanation, stated that, although he had every reason to believe the story told by the prisoner, he had been forced to confine his endeavours in his behalf to breaking down the circumstantial evidence for the prosecution—that most minute and searching inquiries had been made at Bristol, but that from the short time the prisoner had passed in that town (some three or four hours), and from the lengthened period which had elapsed since the murder, he had been unable to find witnesses who could satisfactorily have proved an *alibi*, and had therefore been forced to rely upon the weakness of the evidence produced by the prosecution. Sentence of death was passed upon the prisoner, who was removed from the bar loudly and persistently declaring his innocence.

I left the court painfully impressed with the conviction that he WAS innocent. The passionate earnestness with which he had pleaded his own cause, the fearless, haughty expression that crossed his ill-omened features, when, finding his assertions entirely valueless, he exclaimed with an imprecation, "Well, then, do your worst, but I *am* innocent. I never saw the poor girl in my life, much less murdered her," caused the whole court, at least the unprofessional part of it, to feel that there was some doubt about the case, and that circumstantial evidence, however strong, should rarely be permitted to carry a verdict of "guilty." I am sure that the fervent, though unsupported assertions made by the prisoner, affected the jury far more than the florid defence made for him by his counsel.

The painful scene that I had just witnessed entirely put the events of the morning out of my head, and I walked home with my thoughts fully occupied with the trial.

The earnest protestations of the unfortunate man rang in my ears, and his face, distorted with anxiety and passion, rose ever before me.

I passed the afternoon writing answers to several business letters, which had found me out in my retreat, and soon after dinner retired to my room, weary with want of sleep the previous night and with the excitement of the day.

It had been my habit for many years to make every night short notes of the events of the day, and this evening, as usual, I sat down to write my journal. I had hardly opened the book when, to my horror, the deadly chill that I had experienced in the morning again crept round me.

I listened eagerly for the voice that had hitherto followed, but this time in vain; not a sound could I hear but the ticking of my watch upon the table, and, I fear I must add, the beating of my own coward heart.

I got up and walked about, endeavouring to shake off my fears. The cold shadow, however, followed me about, impeding, as it seemed, my very respiration. I hesitated for a moment at the door, longing to call up the servant upon some pretext, but, checking myself, I turned to the table, and resolutely sitting down, again opened my journal.

As I turned over the leaves of the book, the word Bristol caught my eye. One glance at the page, and in an instant the following circumstances flashed across my memory.

I had been in Bristol on that very day—the day on which this dreadful murder had been committed!

On my way to a friend's house, I had missed at Bristol the train I had expected to catch, and having a couple of hours to spare, wandered into the town, and, entering the first hotel I came to, called for some luncheon. The annoyance I felt at having some hours to wait was aggravated by the noise a workman was making in replacing a pane of glass in one of the coffee-room windows. I spoke to him once or twice, and finding my remonstrances of no avail walked to the window, and, with the assistance of the waiter, forced the man to discontinue his work.

In an instant I recalled the features of the workman. It was the very man I had seen in the felons' dock that morning. There was no doubt about it. That hideous face as it peered through the broken pane had fixed itself indelibly in my memory, and now identified itself beyond the possibility of doubt with the sinister countenance that had impressed me so painfully in the morning.

I have little more to add. I immediately hurried back to the town and laid these facts before the judge. On communicating with the landlady of the hotel at Bristol, she was able to prove the payment of a small sum on that day to a travelling glazier. She came down to X——, and from among a crowd of felons unhesitatingly picked out the convicted man as the person to whom she had paid the money.

The poor fellow being a stranger at Bristol, and having only passed two or three hours there, was utterly unable to remember at what houses he had been employed. I myself had forgotten the fact of my having ever been in that town.

A week later the man was at liberty. Some matter-of-fact people may endeavour to divest these circumstances of their, to me, mysterious nature, by ascribing them to a disordered imagination and the fortuitous recognition of a prisoner condemned to die.

Nothing will ever efface from my mind the conviction that Providence in this case chose to work out its ends by extraordinary and supernatural means.

Here ended his story. I give it you without addition or embellishment, as he told it to me. It is second-hand, I confess, but hitherto I have never been fortunate enough to hear a story with aught of supernatural in it that was not open to the same objection.

THE DOCKS AND THE DOCK-GATES.

Here we are at Aldgate Pump, the Alpha and Omega of English Cockneydom; and soon afterwards we are passing down the Minories in the direction of Tower Hill. On reaching the Mint, we find ourselves in a region which is unmistakeably devoted to Jack. Here we meet him under every possible aspect. Young Jack, just going to sea, marching along with a careless jaunty step, and smiling at every pretty damsel whom he meets; Merchant Jack, with his wife clinging to his arm, a monkey or caged parrot in his tarry hands, and his honest, bluff, big-whiskered, sunburnt features all radiant with good-humoured delight; Shipwrecked Jack, penniless, woe-begone, and miserable, but stout-hearted and hopeful to the last; Man-o'-war Jack, clean, spruce, and jolly; American Jack, bowie-knife in girdle, and asserting his independence by continual expectoration; French Jack, all moustaches, shrugs, and grimace; Italian Jack, padrone-fearing, Garibaldi-loving, and heretic-hating; Spanish Jack, dark-featured, velvet-capped, and breath redolent of onions; Swedish Jack, fair-haired, blue-eyed, and with the old Scandinavian love of the Northern Sea; Russian Jack, brandy-loving, crouching, and cowardly; African Jack, all teeth, grins, and chatter; Australian Jack, Polynesian Jack, Canadian Jack, Arab Jack, Egyptian Jack, Greek Jack—in fact, every conceivable variety of the species. But, take care, we are impeding the traffic which surges along the pavement in front of this dingy, vile-smelling, fusty clothes-shop. A keen, tough old file is the owner. Ikey is quite up to the time of day, so don't *you* ask him what o'clock it is. You had better not. Observe him as he warily and patiently gathers himself up—spider-like—in the midst of his artfully-woven web of "Nor'westers," pea-jackets, linsey-woolseys, bearskins, comforters, oil-cloth capes, fur waistcoats, *devil's-dust* unmentionables, and worsted gloves of fabulous thickness. *He* knows Jack. He can tell *you* in an instant, despite your fancy yachting-rig and sea-going airs, that you are merely a landlubber "as doesn't know a ship's-rope from a marlin-spike," and he passes you by with supreme contempt; but when he catches sight of Jack—the *real* salt-water Jack—ah! you should see him.

He instantaneously brightens up, casts a rapid searching glance around him, and marching direct to the unconscious tar, soon wheedles and cajoles him into the purchase of sundry articles for which he has no earthly use, and which are frequently bought by Ikey's victims at about 100 per cent. above the regular market price. Escaping as he best can from the enemy's batteries, our poor sailor is immediately espied by Poll and Sue, two smart, roguish, saucy-looking craft, with gay coloured streamers fluttering at the fore. They bear down in full sail on him, pour in a heavy broadside of "soft sawder," board him, and triumphantly take their prize in tow to the "Jolly Sailor," where he is cozened, fleeced, and robbed by the merciless crimps into whose hands he falls, and is then turned adrift into the streets.

Evidences of a seafaring population now surround us on every side. Here is a chronometer-maker's, there a naval book-store; here a ship's-biscuit-baker's, there a sail-cloth factory; here a ship's-chandler's, and there a curiosity-shop, wherein a multitude of monkeys are chattering all day long, while the din is increased by the incessant screaming, hallooing, combined with not a little swearing, on the part of numberless parrots and cockatoos, whose gorgeous hues of green, blue, yellow, and crimson, scarcely compensate for the deafening noise which they occasion amongst the gongs, shells, stuffed birds, corals, beads, Japanese ware, Chinese slippers, Indian arrows, Mexican

idols, West Indian pickle-jars, aloe-plants, tamarind pots, African ivory, dried alligators, hippopotamus teeth, walrus tusks, birds of Paradise, beetles, moths, ostrich eggs, carved cocoanut shells, sponges, Australian boomerangs, Ceylon pearls, and other articles with which the interior of the shop is crowded in most picturesque confusion.

Here is one of those seaport pests, an Emigration Agency Office, where but too frequently the poor intending emigrant is regularly swindled of his last penny, on every possible and *im*possible pretence, and then hastily bundled on board some unseaworthy, ill-provisioned, under-manned, and anything but A 1 vessel, which generally makes the voyage in about double the *advertised* time, and ofttimes gets quietly wrecked on some convenient rocks, to the no small profit of the captain and owner.

What a long, dreary expanse of dingy yellow brick wall stretches out on the right of us. It is the boundary wall of the St. Katherine's Docks, and the huge bonded warehouses tower above it, like sullen giants, frowning on the world of misery, debauchery, and devilry, which exists within their very shadow. And now we come on a scene, which from our infancy we have been accustomed to, yet which has always possessed a strange and fearful degree of interest for us. Large numbers of gaunt-featured, squalid, hungry-looking men, are silently but nervously lounging about the gate which forms the entrance to the London Docks. From morning till night they linger there, with restless eye and hopeless heart, in the vain hope of obtaining employment as an "extra" in unlading the ships. A large number of labourers are employed in the docks, as porters, or to assist in removing the cargoes from the ships to the bonded warehouses; and it frequently happens that a sudden influx of shipping necessitates the employment of additional hands, consequently numbers of unemployed men find their way here, in the hope of obtaining a chance job, for the work, though ill paid and heavy, requires no skill, but merely brute strength. The dock gates are one of the last resources of the poverty-stricken, and the crowd forms a strange medley as it stands in doorways, crouches on pavement curbs, stands at flaunting public-house doors, slouches against greasy walls, or darkens the plate-glass windows of magnificent gin-palaces. Hour after hour, day after day, week after week, month after month, year after year, *there* it is. True, some of its members gain other employment; many become beggars or criminals; while not a few drag their weary fever-wasted limbs to dark cellars, or miserable windowless lofts, where they lay themselves down to await the death-angel. Still there are hundreds to supply their places, for the ranks of the unemployed are continually recruited by the victims of dissipation, misfortune, or crime; and so the ball whirls ceaselessly round.

We are Social Economists, and, as such, we are perfectly aware that much, if not all, of this misery and suffering is occasioned by the popular disregard, dislike, or neglect of the fundamental principles of social science; but we are *human*, and cannot gaze on the scene before us without a throb of compassion for the helpless victims of poverty and misfortune, who are the chief actors therein.

But, hark! a stentorian voice shouts "Men wanted." The effect is magical. The listless demeanour of the crowd changes in a moment to one of bustle and activity; and it speeds with desperate headlong haste to the dock gate, where it blocks up the road, and renders the pavement totally impassable.

Perhaps only a dozen hands are required, but there are already two or three hundred applicants, besieging the sturdy, determined-looking man, to whom is entrusted the unenviable duty of selecting the necessary men, which is instantly done by his practised eye.

The labourers thus picked out, have—despite their energetic and sometimes fistic remonstrances—to fight their way through the dense, heaving mass, which commences a terrific clamour. Shouting, wrestling, struggling, fighting, kicking, and swearing, the disappointed men strive to prevent their successful competitors from approaching the gate, and for a few moments cries, curses, groans, imprecations, and hisses commingle in deafening discord. The strongest dash aside the weakest, all friendship is forgotten, and the animal passions predominate in the breasts of those who compose the crowd; as they push and grapple with each other in the frenzied, savage excitement of disappointment and despair. Then the loud clear voice of the foreman is heard threatening the foremost of the refractory, and instantly the tempest subsides, and all is comparatively silent. The men with scowling, sullen looks, slowly retreat to the old nooks and corners, to await another chance. A few strive to obtain liquor on credit at the beershop, others retreat slowly homewards, while the remainder settle down into the old attitude of listless expectancy; and the careless pedestrian passing by would perceive few traces of the recent agitation occasioned by the "battle for bread" as one of the men graphically described it. So the men wait, wait, and wait, till they drop off, one by one, and leave their places to be filled by others, who in their turn go through the same dismal, heart-crushing routine.

We wish that some of our sturdy building operatives, who are so fond of "striking" on every trivial pretence, could behold the sight. It might possibly induce them to consider whether there are not worse things than toiling ten hours per day, for thirty-three shillings per week.

John Plummer.

MOTHER SHIPTON: HER LIFE AND PROPHECIES.

The Library of the British Museum contains two exceedingly attenuated quarto volumes of very considerable value, on account of their rarity, one of which is entitled "Mother Shipton's Prophecies," published in 1663; the other "The Life and Death of Mother Shipton," published in 1687. As there are some very remarkable events recorded in this latter, touching the parentage and infancy of this renowned lady, I shall draw upon its contents, previous to referring to the prophe-

cies, by the utterance of which she made herself a name, which endures to this day, in every town and hamlet throughout the length and breadth of the kingdom.

The full title and imprint of the book in question runs thus: "The Life and Death of Mother Shipton. Strangely preserved amongst other writings belonging to an old monastery in Yorkshire, and now published for the information of posterity. London: Printed for W. Harris, and are to be sold by him in Dunnings Alley, without Bishopsgate. 1687."

The condition of the manuscript when found was not favourable to a fluent perusal, indeed it was almost illegible; but Mrs. R. Head seems to have had an intuitive consciousness that it contained something of importance, so she steeped some best galls in good white wine, distilled the solution, and then, as she says, wetted the ink of the illegible M.S. handsomely, and made the letters as fresh and fair as if they had been newly written. All this, and a good deal more, is set forth in the preface, which the authoress concludes by saying that she might have made it much longer, but was afraid lest—like the citizens of Mindium—she might make her gates too big for her city.

From this MS. then, it appears, that Mrs. Agatha Shipton resided at Knaresborough, near the dropping-well. How she managed to live is somewhat of a mystery, seeing that she was miserably poor, and would neither beg nor work. One day she was sitting alone under a tree when a handsome young gentleman accosted her, and was so smitten with the charms of her person and conversation that he offered marriage on the spot. That she accepted him is not a matter for surprise, and it was arranged that they should meet at the same place on the succeeding day, when he would take her to the halls of his ancestors, where the ceremony could be performed in due state. All this was duly carried out as proposed, but the result was not altogether so favourable to her future welfare as she might reasonably have expected it would be. In the first place, she found herself on the ensuing morning under the same identical tree, clothed in rags in lieu of the rich and gorgeous array she had worn on the preceding evening, and in the next, she had not the least idea in which direction to go in search of her husband. While she was bemoaning her hapless fate the same young gentleman appeared, but the revelation he made to her respecting his position was very far from being of a gratifying nature, and the chief advantage that she derived from her connection with him was power of a very extraordinary character certainly, but not satisfactory in a pecuniary point of view. It was reported of her subsequently that she had been seen when walking alone to stamp on the ground, make motions with her hands, repeat a word three times, whereupon the sky which had previously been clear became dark and gloomy, and "belcht out nothing, for half-an-hour, but flames,—thundering after a most hideous manner." From this it was inferred that she was a witch, and she was therefore seized and taken before a justice, but she defied that functionary, and exclaiming, "Updraxi, call Styicon Helluox,—a fiery-winged dragon forthwith appeared, took her up, and carried her away from the amazed justice and his attendants," who are said never to have meddled with her afterwards.

Several instances are mentioned of the terrible things she did to neighbours when by their prying into her affairs they sent her off on the "rampage," but I shall refrain from mentioning them for two reasons. I doubt whether they are strictly true, and they lack the refinement which distinguishes all the actions of the sex to which she belonged. Let it suffice to say that she died on the same day that she introduced the amiable infant into the world, whose personal appearance is thus described by her admiring biographer, who, certes, cannot be said to have dipped her brush in the colours of flattery. "Her physiognomy was so misshapen that it is altogether impossible to express it fully in words, or for the most ingenious to limn her in colours, though many persons of eminent qualifications in that art have often attempted it, but without success; therefore, according to the best observations of her, take this true, though not full account of her features and body; she was of an indifferent height, but very morose and big-boned, her hair very long, with very great goggling, but sharp and fiery eyes: her nose of an incredible and unproportionate length, having in it many crooks and turnings, adorned with many strange pimples of divers colours, as red, blew, and mixt, which, like vapours of brimstone, gave such a lustre to her affrighted spectators in the dead time of the night, that one of them confessed several times in my hearing that her nurse needed no other light to assist her in the performance of her duty. Her cheeks were of a black swarthy complexion, much like a mixture of the black and yellow jaundies,—wrinkled, shrivelled, and very hollow, insomuch that as the ribs of her body, so the impression of her teeth were easily to be discerned, excepting only two of them which stood quite out of her mouth in imitation of the tusks of a wild boar, or the tooth of an elephant, a thing so strange in an infant that no age can parallel. Her chin was of the same complexion as her face, turning up towards her mouth, as if there had been a more than ordinary correspondence between her teeth and it. Her neck so strangely distorted that her right shoulder was forced to be a supporter to her head, it being propt up by the help of her chin, in such sort, that the right side of her body stood much lower than the left; like the reeling of a ship that sails with a side winde. Again, her left side was turned quite the contrary way, as if her body had been screwed together piece after piece, and not rightly placed . . . . . Her leggs very crooked and misshapen, the toes of her feet turning towards her left side; so that it was very hard for any person to guess which road she intended to stear her course; because she never could look that way she resolved to go."

This was in her youthful days; she grew more ugly as she grew older, so it is asserted, but this is rather difficult to believe.

Being without a mother, and the exact position of her father's domicile not being ascertainable,

the parish authorities were obliged to take upon themselves the expense of her maintenance; they accordingly handed her over to a nurse, and a very hard time of it the nurse had with her. All the spirits of the neighbourhood seem to have assembled in the nurse's cottage to amuse the weird infant; and it is singular to find in a book nearly two hundred years old a description of their tricks, so closely resembling the highly intellectual performances at a spiritual conference in the modern drawing-room. Among other things, they are said to have set the heavy furniture walking up and down the stairs, which gave the chairs and stools a clearer space for amusing themselves below in playing at "Bowles with the Trenchers and Dishes." At last they became so uproarious in their indulgence of these innocent pursuits, that the nurse got tired of it, and Mother Shipton, as she was already called, having become a big girl, the parish, at her request, relieved her of her charge, and took it upon themselves; putting her to school "that she might receive the education commonly given to the children of paupers, namely, reading, writing, and sewing." (This was written, be it remembered, nearly two hundred years ago.) For some reason or other, she was not popular among her fellow-students. They ridiculed her personal appearance, and she retaliated by causing all the Robin Goodfellows, Ariels, and Pucks of her acquaintance to pinch and otherwise annoy and injure them to such an extent, that she was at last expelled from the school, and thrown upon the wide world, with nothing but her own resources to rely upon. Feeling that she "had a mission," she followed the promptings of her internal consciousness, and established herself in the neighbourhood as the real original medium. Persons began now to visit her, to consult her on future events, and as she always gave them the information couched in sufficiently ambiguous language, and invariably refused to take any fee for her trouble, they were loud in their praises of her knowledge and disinterestedness. It is true that she kept a girl as servant, who was always willing to accept anything visitors chose to give, and who took care to remind them of their duties in this respect, if necessary, by telling them that she and her dame could not live on thanks; quoting the aphorism which has come down to our time, that "it is money makes the mare to go."

Gradually, however, her fame travelled beyond this narrow circle, and people came to her from distant parts, just as in more ancient times they visited the pythoness of Delphi.

Her biographer concludes her performance as follows, and I would recommend the prophecy to the particular attention of those who are skilful in the interpretation of such things, as offering a wide field for the exercise of their peculiar talent:—

"Great noise there shall be heard, great shouts and cries,
And seas shall thunder louder than the skies;
Then shall three lyons fight with three, and bring
Joy to a people, honour to their king.

"This Mother Shipton lived till she was of an extraordinary age, and though she was generally believed to be a witch, yet all persons whatever, that either saw or heard of her, had her in esteem, and her memory is to this day much honoured by those of her own country.

"A stone was erected near Clifton, about a mile from the city of York, from which the following is taken:—

Here lyes she who never ly'd,
Whose skill often has been try'd.
Her prophecies shall still survive,
And ever keep her name alive.

The title-page of the other volume containing her prophecies is faced by a woodcut, which represents Henry VIII. seated on his throne, his feet resting on the back of Pope Clement, who is prostrate in the dust, his broken tiara lying on the ground near him, to the great grief of a whole army of monks on the king's left hand, among whom is Cardinal Pole. This latter dignitary is assisting the Pope to rise, and on the other side Bishop Fisher is tendering his hand to support his head. On the king's right hand stands Cranmer, who is presenting him with the Bible, and behind him Cromwell. The imprint runs thus: "Printed by T. P., for Fr. Coles, and are to be sold at his shop, at the signe of the Lambe, in the Old Bailey, neare the Sessions house, 1663."

In this collection of her prophecies, those to which most prominence are given, are those having reference to Cardinal Wolsey, the fate of the messengers sent to her by the king, and the treatment of religious institutions by this monarch.

"When she heard that King Henry the Eighth should be king, and Cardinall Wolsey should be at Yorke, she said that Cardinall Wolsey should never come to Yorke, which the King and the Cardinall hearing, being angry, sent the Duke of Suffolk and the L. Darcy to her, who came with their men disguised to the King's house, near Yorke; where leaving their men, they went to Mr. Besley in Yorke, and desired him to goe with them to Mother Shipton's house, where when they came they knocked at the doore, she said, Come in, Mr. Besley, and those honourable lords with you, and Mr. Besley would have put in the Lords before him; but shee said, Come in, Mr. Besley, you know the way, but they doe not. This they thought strange that shee should know them and never saw them; then they went into the house, where there was a great fire, and they dranke and were very merry. Mother Shipton, said the Duke, if you knew what we came about you would not bid us so welcome; shee said the messenger should not be hanged: Mother Shipton, said the Duke, you said the Cardinall should never see Yorke; Yea, said shee, I said he might see Yorke, yet never come at it. But, said the Duke, when he comes to Yorke thou shalt be burned: Wee shall see that, said shee, and plucking her handkercher off her head, she threw it into the fire, and it would not burne; then she tooke her staff and turned it into the fire, and it would not burne; then she tooke and put it on againe. Then said the Duke, What meane you by this? She replyed, If this had burned I might have burned. Mother Shipton, quoth the Duke, what thinke you of me? My Lord, said she, the time

will come when you will be as low as I am, and that is a low one indeed. (The Duke was afterward beheaded.)

"My Lord Piercy said, And what say you of me? My Lord, said shee, shooe your horse in the quick and you shall doe well, but your bodie will be buried in Yorke pavement, and your head shall be stolne from the Barre and carried into France. At which they all laughed, saying, that would be a great lop between the head and the body. (This proved true, for hee rose in rebellion in the north, and by not flying when hee might, hee was taken and beheaded in Yorke, where his body was buried, and his head was stolne away and carried into France, tempore Eliz. Reg.)

"Then said the Lord Darcy, And what thinke you of me? She said, You have made a great gunne, shoot it off, for it will never doe you any good; you are going to warre, you will paine many a man but will kill none. So they went away.

"Not long after the Cardinall came to Cawood, and going to the top of the tower, he asked, where stands Yorke and how far it was thither; and said that one said he should never see Yorke; Nay, said one, shee said you might see Yorke, but never come at it. He vowed to burne her when he came to Yorke. Then they shewed him York, and told him it was but eight miles thence, he said that he would soon be there; but being sent for by the king, he dyed in his way to London at Leicester of a Laske. And Shipton's wife said to Mr. Besley, yonder is a fine stall built for the Cardinall in the Minster of gold, pearle, and precious stones; goe and present one of the pillers to King Henry, and he did so."

It would seem that some of the versions of this prophecy previously printed could not be reconciled with the facts as they occurred, so the author places a note in the margin, "Note that this prophecie was never exactly printed before."

Furthermore, she prophesied that the day would come when the north should rue it wondrous sore, and the south should rue it evermore; when hares should kindle on the cold hearthstone, and lads should marry ladies and bring them home. This the editor supposes to refer to the suppression of religious houses, and says that the natural phenomenon referred to did actually occur at Lord Will. Howard's house at Naworth. I do not know what truth there may be in this last statement, but a similar prophecy is attributed to Thomas the Rhymer with respect to his residence, and also to Waldhave. The truth however seems to be that the idea was borrowed from an old MS. in the Harleian collection, where it is used to indicate utter desolation, and not applied to any particular locality.

Among others who visited her was the Abbot of Beverley, who desired to discover what would be the result to him of the disputes raging between Henry VIII. and his order. He came disguised, but he had no chance of maintaining it against a prophetess who could see her customers through a door. No sooner had he knocked than she called out, "Come in, Mr. Abbot, for you are not so much disguised but the fox may be seen through the sheep's skin; it is not those clothes makes a lay person, no more than a long gown makes a man a lawyer; come, take a stool and sit down, for you shall not goe away unsatisfied of what you desire." The prophecy, however, with which she favoured him had less reference to his own particular case than to that of his order and Cardinal Wolsey; still it is said to have been sufficient to send him away in great admiration of her powers, though it is stated that at the time he was utterly unable to understand what she meant.

The coming of King James she foretold, and also that when he was in London his "tayle should be at Edinborough," which, as every reader of history knows, was the case, and that it extended a good way beyond that city. "And when there is a Lord Maior at Yorke let him beware of a stab;" a caution not uttered without a reason, for we are told a Lord Mayor whose house was in the Minster at York was killed with three stabs. Apparently there are bad days in store for the citizens of London, for at another time she said, "The time will come when England shall tremble and quake for feare of a dead man that shal be heard to speak: Then will the Dragon give the Bull a great snap, and when the one is down they will go to London town: Then there will be a great battell between England and Scotland, and they will be pacified for a time; and when they come to Brammamore they fight, and are againe pacified for a time; then there will be a great battell between England and Scotland at Scotmore: Then will a raven sit on the cross, and drinke as much blood of nobles as of the comons; then woe is me, for London shal be destroyed for ever after." Here the editor puts a note in the margin running thus. *It is to be noted and admired that this cross in Shipton's dayes was a tall stone cross, which ever since hath been by degrees sinking into the ground, and now is sunke so low that a raven may sit upon the top of it, and reach with her bill to the ground.*

One more extract, which as the events predicted have not yet come to pass, possibly remain to be fulfilled, and I close my notice of a book which, without the cover, would probably fetch, at a sale at Sotheby & Wilkinson's, or Puttick & Simpson's, twenty times its weight in gold. "There will come a woman with one eye, and she shall tread in many men's bloud to the knee; and a man leaning on a staffe by her, she shall say to him, What art thou? and he shall say, I am the King of Scots, and she shall say, Goe with me to my house, for there are three knights, and he will goe with her, and stay there three dayes and three nights; then will England be lost, and they will cry twice a day, England is lost. Then there will be three knights in Petergate in Yorke, and the one shall not know of the other. There shall be a child born in Pomfret with three thumbs, and those three knights will give him three horses to holde while they winne England, and all noble blood shall be gone but one; and they shall carry him to Sheriff Hatton's castle, six miles from York, and he shall dye ther, and they shall chuse ther an Earl in the field, and hanging their horses on a thorne, will rue the time that ever they were borne to see so much bloodshed. Then they

will come to York to besiege it, and they shall keep them out three dayes and three nights, and a penny loafe shall be within the bar at half-a-crown, and without the bar at a penny; and they will swear if they will not yield to blow up the Town walls. Then they will let them in, and they will hang up the maior, sheriffs, and aldermen, and they will goe into Crouch church, there will three knights goe in, and but one come out againe, and hee will cause proclamation to be made, that any may take house, bower, or tower, for twelve yeares, and while the world endureth ther shall never be warfare againe, nor any more king or queenes ; but the kingdom shall be governed by three Lords, and then Yorke shall be London. And after this shall a white harvest of corne be gotten in by women. Then shall be in the north that one woman shall say unto another : Mother, I have seene a man to-day, and for one man there shall be a thousand women. A ship shall come sayling up the Thames till it come against London, and the mr. of the ship shall weepe, and the mariners of the ship shall aske him why he weepeth, being he hath made so good a voyage, and he shall say : Ah what a goodly city this was, none in the world comparable to it, and now there is left scarce any house that can let us have drinke for our money." It is of course clear that this master mariner must be Lord Macaulay's New Zealander. G. L.

AN OLD STORY OF OLD GIBRALTAR.

Between Gibraltar and Malaga, on one of the spurs of the mountains which run from the main-land to the sea, is situated the castle of Fuengerola. It is an old Moorish building, with walls of great thickness, cemented with mortar, which has hardened into a substance more durable than the stone. Previously to the French occupation, our engineers attempted to destroy it, but failed. The general feature of the surrounding country is alternate ridge and ravine ; all sufficiently rugged ; very pretty for skirmishing, but little adapted to the regular movements of a line.

I was quartered at Gibraltar in the year 18—, and for some reason or other—I never could understand exactly why—the Deputy-Governor of Gibraltar appears to have set his heart on the capture of this place. I never saw that it could do us much harm in the hands of an enemy, and I am sure that it would never do us any good in our own. But to reduce it would make a "diversion," a favourite proceeding in the tactics of the day ; in pursuance of which we lost more men in petty operations than would have furnished a powerful army in the field. General Campbell resolved upon having a diversion !—and we had two.

The first expedition was placed under the command of Major-General Bowles, a very disagreeable, but not very effective officer. He failed at Fuengerola—he died gallantly at Albuera. The next trial was confided to the guidance of Major-General Lord Blayney—a very pleasant companion, an excellent judge of cookery, but not destined to become a great general. The only regular troops employed were a very weak battalion of the 89th regiment—of which Lord Blayney himself was the lieut.-colonel—commanded by one major, four or five captains (one of whom was on the staff), and a very insufficient corps of subalterns. The troops were accompanied by two six-pounders ; and there were detachments, principally composed of foreign deserters, whose British officers, appointed for the occasion, had joined them a few days before the expedition sailed. These were not probable elements of success ; the end turned out worthy of the means.

The troops, having been landed at a short distance from the castle, were marched by their noble commander to the summit of the ridge nearest to it. There they were halted, and in due course the word "Dress" was given ; but the rocks did not hear the command. The general called out, "Why do you not dress your battalion, Major Grant ?" Major Grant moved to the front, and was immediately picked off by a rifleman from the walls of the fort.

About this time an important event was pending—dinner ! The noble commander withdrew his men down the ravine for refreshment—the enemy, who perhaps had already dined, made a sally, and captured our pippin-squeezers ; but they did not hold them long. Our men reascended the height, and retook the guns. This point of time is important to my story. The guns were on the right of the line, next to them the Grenadier company ; Lord Blayney was on the extreme left ; from which position he saw a body of troops approaching his flank.

"Here come the Spaniards," said the noble commander.

"I think they are French," said some officers about him.

"I'll soon show you they are Spaniards," said the lord, and advancing, he took off his hat, and courteously saluted them. They were French ! and Major-General Lord Blayney was a prisoner ! He was taken to France, where he remained till the peace, and in the interim greatly improved his knowledge of cookery.

As soon as the general was thus unaccountably taken a panic seized the troops. Commencing on the left of the line, it spread to the right, and the whole body in utter disorder rushed down into the ravine, from which they were rescued and re-embarked by the boats of the men-of-war.

Thus ended the military incidents of the raid of Fuengerola. But the consequences were not yet. In all such cases of failure it becomes necessary to look out for a scapegoat. Lord Blayney (even if it had been permissible in those days to bring a lord to a court-martial) was a prisoner of war. Major Grant was killed. Captain Annesley—who ought to have taken the command, at least of the 89th, but did not—was also in the hands of the enemy. The next officer in regimental succession was Barnes, the Captain of Grenadiers—on him the lot fell. He had come from the 10th Hussars, a bad school under a bad master. He brought with him all the coxcombries and vexations of minutiæ which, even to this day, distinguish the martinets of crack cavalry regiments. He made himself specially unpopular among the non-commissioned officers. Hence it was said that a con-

spiracy was formed against him. It did not break out at once. Several weeks elapsed after the defeat, before rumours began to fly about, and it was determined to bring him to a court-martial on the charge of cowardice; and if the evidence of several sergeants was to be believed, there would be no doubt that he was guilty. They swore, with singular unanimity, that they had seen Captain Barnes running away down the ravine before Lord Blayney was taken, and before any disorder had commenced from the left of the battalion. Now, their duty was to look to their front, and so, to account for their looking to their rear instead of to their front, each was anxious to give some reason for his being able to see down the ravine. One or two accounted for it in this way: they swore that before Lord Blayney was taken, a mounted officer's horse was shot in rear of the centre, and in falling knocked them down. In rising, one of them declared that he saw the Captain of Grenadiers half-way down the ravine, and quite alone. On the other hand, two captains of Artillery—Lloyd and Faede—deposed that before Lord Blayney was taken they had seen Captain Barnes at his post, on the extreme right of the regiment, that he had spoken to them, congratulating them on the re-capture of the guns, and that Colonel Warrington,* the mounted officer (whose horse had been shot), could corroborate this evidence; but unfortunately Colonel Warrington was absent in England on leave. The weight of positive evidence was thus in favour of the non-commissioned officers. They spoke as to an unmistakeable fact—that they had seen Captain Barnes running down the ravine before Lord Blayney was taken; Captains Lloyd and Faede swore that they had spoken to him afterwards. But without doubting their veracity, the majority of the court formed the opinion that they had been mistaken as to the time; while the witnesses for the prosecution † could not have been mistaken as to the fact.

I had assisted Barnes in his defence, and retained a strong opinion that he was not guilty.

In the usual course, the proceedings had to be sent to England for confirmation. A considerable time elapsed, when one morning very early an orderly woke me, and told me that Colonel Sewell, the commanding officer of the 89th, to which I was temporarily attached, wished to see me immediately. "You know, F——," he said, "that the packet came in last night, and has brought the sentence of Barnes's court-martial. He is cashiered. I cannot bear to tell him. You know him more intimately; I shall be obliged to you if you will break it to him before it appears in orders." The task was not a pleasant one, but I could hardly decline it.

I did not go direct to his quarters, where his wife had been confined a day or two previously; but I sent him a message to meet me on the South Bastion. This rendezvous somewhat prepared him. After a few words I told him the truth. He never moved, he never spoke;—a fit of catalepsy could not have made him more rigid. I expected every instant to see him fall. At length sounds issued from his motionless lips. "My wife has her first child, and I have not a shilling."

That night I went to the rooms of the unfortunate couple. It was a melancholy meeting, but it was relieved by an unexpected incident.

A Colonel Wright, of the Artillery, had been a member of the court-martial. He had the reputation of being a hard, harsh man, and I looked to him with some apprehension; nor was I alone in my fear. Of course his opinion of the verdict is a secret to me to this day. I can only guess it.

A servant brought in a little parcel, like a pill-box, and a note from Colonel Wright. I opened the parcel first. It contained five or six doubloons. The note said, that Colonel Wright, having heard that Captain Barnes was in pecuniary difficulties, begged his acceptance of a trifling assistance.

Many days had not elapsed when I heard that Colonel Warrington had returned. I hastened to him, and begged him to write down for me the substance of a conversation we had had immediately after the event, and long before proceedings against Barnes had been contemplated.

He did so, stating that he perfectly well recollected that after Lord Blayney was taken on the left, he proceeded by the rear of the 89th towards the right; that his horse was shot in rear of the centre; that in its struggles it knocked down some men; that he then proceeded on foot to the right of the battalion, and there found Captains Barnes, Lloyd, and Faede. The confusion then ensued, then the general retreat, and he lost sight of those officers.

This I considered so conclusive that I embodied the statement in a deposition, which I annexed to a memorial to the Prince Regent.

Barnes was restored to his rank, and joined the 89th again in Canada, where, in the action at Christler's Farm, he so distinguished himself as to be noticed in General Orders, and consequently obtained the brevet rank of major.

J. S. M. F.

* Afterwards Consul-General in Morocco.

† The leading witness and informant for the prosecution was the sergeant of Light Infantry—a smart clever fellow, who had been clerk to an attorney in Ireland. He became so conceited on the result of Barnes's conviction that he principally employed his time in collecting notes for charges against other officers. Carrying this a little too far, he was himself brought to a court-martial, reduced to the ranks, and flogged.

AN ARTIST'S RAMBLE ALONG THE LINE OF THE PICTS' WALL.

PART II.

THE day succeeding our visit to Borcovilles was that on which the September fair was held at Haltwhistle, and as a heavy rain fell during the greater part of the day, we were much about the inn, although every room was occupied by men attending the fair, the bed-rooms being appropriated by their wives and daughters who accompanied them. At first we found this rather awkward, but in the long run we settled down into fellowship, and heard some Tynedale ditties and "auld warld" stories, which were not sung and said without an enormous consumption of whiskey.

An elderly but hale-looking laird, who was familiarly named Tom-o'-the-Loanin, related an instance of the discomfiture of a London counsel, by the shrewdness of a drunken witness, in an

assault-case, at the Newcastle assizes, which greatly tickled the company. It appeared the man of law had, previous to the trial, been dining near Haltwhistle, and whether he had taken his wine too freely, or his horse was in fault, he got a fall, and had been ministered to by the Samaritanship of the witness in question. On the trial it was his object to make it evident that the said witness was too intoxicated at the time of the assault to be in a condition to testify to what took place. With this view he plied him with a series of questions in reference to his proceedings during the day, in the evening of which the outrage took place, which, as the laird related it, ran somewhat as follows:

Counsel. "Do you remember the morning of the day in question?"

Witness. "Ay, weel."

Counsel. "Had you any particular business in hand that morning?"

Witness. "Why, I just went up the hill to Foggeridge, to see if I could make a bargain for two or three yowes."

Counsel. "Did you buy the ewes?"

Witness. "Ay, I bought the yowes."

Counsel. "When a bargain is struck, does not the seller allow something for drink-money?"

Witness. "Ay, the luck-penny."

Counsel. "Did you drink the luck-penny?"

Witness. "In coorse, we drank the luck-penny."

Counsel. "A glass,—or more?"

Witness. "I see ye ha' the keelvine in your hand, you may put down three."

Counsel. "After this, did you go home?"

Witness. "Na; I had to go to Hardriding about a pig."

Counsel. "Did you buy again?"

Witness. "Na; we couldna come to an agreement."

Counsel. "Then you had no more to drink?"

Witness. "Hoot, ay! Bargaining's drouthy wark. Ye may put down three or four glasses at Hardriding."

Counsel. "And then did you return home?"

Witness. "Why, na. Aw just went round by Melkridge, to take my bit dinner wi' Johnny Ha'."

Counsel. "But surely you did not drink more that day?"

Witness. "Just allow me to tell you, that if ye war takin' yer dinner wi' Johnny Ha', if ye wadna drink, he wad gar ye!"

Counsel. "And how much may you have taken after dinner?"

Witness. "Hout! mair than aw can mind o'; ye winna get far wrang if ye only set dawn eneugh."

Counsel. "What did you do after you left Johnny Hall's?"

Witness. "Aw went heam to Haltwhistle."

Counsel. "Did you find the way unusually long?"

Witness. "Why, then, it wasn't just the length, but the breadth o' the way, that aw minded meast."

Counsel. "I trust, after such a quantity of drink, that you were not tempted to stop by the way for more?"

Witness. "Na, for there's ne'er a public atween Melkridge and Haltwhistle toon end. Aw dinna ken hoo it is. A man aye kens when he's had ower little, an' he kens when he's had ower much, but he never kens when he's had just eneugh; so I e'en pulled bridle at Tibby Elliot's at the toon end, and had a stirrup-cup."

Counsel. (Drawing himself up, and addressing witness slowly and with emphasis.) "Why, man!—do—you—mean to say that after swallowing such an enormous—quantity of intoxicating drink, as you own—you could be in a condition to understand the particulars of the assault you now presume to testify to?"

Witness. "Why, as to that, I might na be quite sober; but aw wasn't half sae druuk as ye war yersel', only last Saturday, when ye coupit aff yer bit nag at the crook of Bellister lòan, amang a' the clarts, an' mead a holy bison o' yersel', an' aw had to scrape ye clean, an' get ye sotten on again. Eh! man, aw ken ye agean weel, though ye hae na the manners to mind o' me that did ye sic a neerborly turn."

"I'se warrant!" said the laird, "little Dick Rutherford was upsides wi' the man i' the wig, an' he had it a' his own way after that, for ne'er another word had t'other to thraw til a' dog."

While Tom-o'-the-Loanin and his companions beguiled the time in this manner, we could observe that a good deal of sweethearting went on upon the stairs, the more staid dames being assembled at a solemn tea-drinking in an upper-room. At length came the time for calling a reckoning and departing, each on his way. The iron hoofs of their nags clattered at the door; the stirrup-cup was drunk, and the Tynedale men took the road, some of them bearing behind them, on pillions, buxom dames and bonny lasses, with jovial halloos that we could hear even after they had crossed the Tyne, ringing back from the heathy sides of old Plenmeller.

The next morning we devoted to a survey of the old-fashioned town of Haltwhistle, which consists of little more than a long straggling street, at either end of which there is a peel-tower, both inhabited. The church, which is dedicated to Holy Cross, is situated on the south side of the town. It is a stately and ancient edifice, chiefly in the early English style. In the chancel are the trophies of the family of Blenkinsop, whose ancient castle stands in ruins on the south bank of the Tyne, a few miles to the west of Haltwhistle. Here is likewise an altar-tomb to the memory of John Ridley, Esq., brother to Dr. Nicholas Ridley, Bishop of London, bearing a rhyming inscription, which runs thus:—

IHON REDLE
THAE SVM
TINE DID BE
THEN LAIRD OF THE WALTON
GON IS HE OVT OF THES VAL OF MESRE
HIS BONS LIE VNDER THES STONS

WE MUST BELEVE BE GOD[s] MERCE
INTO THE WORLD GAVE HES SON
THEN FOR TO REDEM AL CHRISTEN

SO CHRIST HAES HES SOVL WON
AL FAETHFVL PEOPLE MAY BE FAEN

WHEN DATH COMES THAT NONC . . . .
THE BODE KEPT THE SOVL IN PAEN
THROVGH CHRIST IS SET AT LIBERTE
AMONG BLESED COMPANE TO REMANE
TO SLEP IN CHRIST NOW IS GONE
YET STEL BELEVES TO HAV . . . . . AGANE
THROVGH CHRIST A JOYFVL RESVRECTION
AL FRENDES MAY BE GLAD TO HAER
WHEN HES SOVL FROM PAEN DID GO
OVT OF THES WORLD AS DOETH APPEAR
IN TH YEAR OF OVR LORD
A 1562
XX

The church consists of a nave, two side aisles, and a chancel of a lofty pitch, and possesses a curious font. Towards the east end of the town, on the south side, there is an extensive and strong earthwork, of an oval form, called Castle Bank. On the east end it is scarped in four terraces; the crown of the hill is protected by a breastwork of earth facing the town, the other slope towards the river being naturally steep and inaccessible. Near the river are the traces of a Roman military station, called Whitchester. We now sauntered over the bridge, which here crosses the Tyne, to Bellister Castle, a short distance from Haltwhistle. This picturesque ruin belonged to a younger branch of the Blenkinsop family. It stands upon an artificial mount, and is overshadowed by a sycamore of extraordinary growth. Surrounding the mount is a broad fosse. From Bellister we bent our steps by a walk chiefly through the fine grounds of Unthank to Willimoteswick, a capital example of a border stronghold, and formerly a residence of the family of Ridley, from which sprang the Oxford martyr, and which family is now represented by Sir Matthew White Ridley of Blagdon. This family had also a residence at the Walltown, as appears in the afore-mentioned epitaph in Haltwhistle church, and another at Hardriding, on the opposite bank of the river:—

Hardriding Dick,
And Willimoteswick,
And Jack o' the Wa',
And I cannot tell a'.

Are they not set forth in the ballad which Surtees wickedly palmed upon Scott as a thing of veritable antiquity, in the faith of which he printed it? Leaving Willimoteswick, we crossed the Tyne, by stepping-stones, to Bardon Mill, and returned to Haltwhistle, passing through Melkridge, where there is a peel-tower, which formerly belonged to the Blackett family.

Next morning H—— and I, together with W——, with whom we had smoked the pipe of confabulation the night previous, bent our way up the long steep hill to Haltwhistle Moor, and passing two ancient monumental stones, called by the moorsmen the "Mare and Foal," we rested awhile for the refreshment of a glass of ale and some barley cake at the roadside public-house, of the sign of "Twice-Brewed Ale," well known to pilgrims of the Wall, and thence proceeded to the Little Chesters, the Roman Vindolana, a camp nearly two miles to the south of the wall, which was garrisoned by the Cohors Quarta Gallorum. In approaching this camp we observed a Roman milestone, upwards of six feet in height and about two feet in circumference, standing in its original position. On its western face there has been an inscription, now illegible. Another milestone stood to the west of this, ubt it was split by an ignorant proprietor for gate-posts. Horsley gives the inscription—BONO REIPVBLICÆ NATO; To one born for the good of the Republic. The space between these two stones was measured, and found to be 1698 yards, which is assumed to be the exact length of the Roman mile.

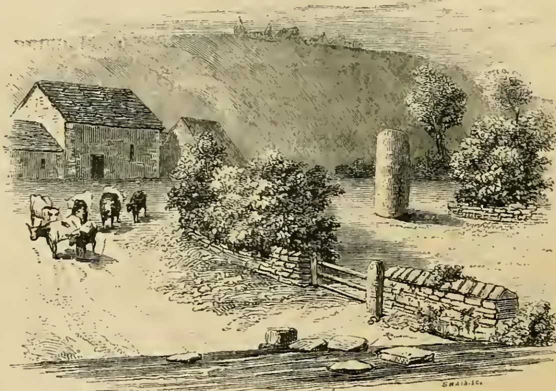
In the house and grounds at the Little Chesters, sometimes called the Bowers, or Chester in the Wood, a choice collection of Roman antiquities, found in the neighbourhood, are preserved. A very fine altar to Jupiter bears testimony that the camp here was the Roman Vindolana, having, according to the inscription it bears, been erected by Pituanius Secundus, præfect of the fourth cohort of the Gauls, which appears to have been stationed at Vindolana. The name Vindolana is surmised to have been derived from *vin*, in Celtic, a height, and *lann*, in the Gaelic, weapons, giving the Ossianic name of Hill of Arms. The camp, or station, is greatly dilapidated. A portion of the wall near the north-east corner of the station was found at a height of twelve courses of masonry. The vestiges of two buildings, both having hypocausts, have been discerned. Near the milestone afore-mentioned is a large tumulus, the burial-place, it may be, where the once mighty and renowned have long slept the sleep of dust and oblivion—

Their deeds, their prowess, all forgot.

A road, still in use, leads from the station of Borcovicus to Little Chesters. This is laid down in Horsley's plan as a military way between the stations. In the valley below Housesteads is a small eminence called Chapel Hill, so called from a temple having stood on its side. Two fine altars found here are in the Museum of the Society of Antiquaries of Newcastle. Some fragments of large columns remain on the ground, and appear to have been parts of a building of considerable magnitude. A cave, dedicated to the Mithraic worship, was discovered at Chapel Hill. It is now entirely destroyed, but is thus described by the Rev. John Hodgson: "It faced the four cardinal points, and its area, which had been dug out of the side of the hill, opposite the west end of the Chapel Hill, measured 12 feet 8 inches from north to south, by 10 feet from east to west, besides having a recess in the middle of the west wall, 30 inches deep and 7 feet long. The east wall had a doorway through it, and, to the level of the floor, inside and out, was faced with hewn stone; but the other three sides, especially the west, were faced on the inside only, their outsides having been built up against an excavation of from four to five feet deep. The floor was paved with thick sandstone slates, of irregular sizes and shapes. A spring was an essential requisite to a Mithraic cave, and the waters that rose in this were drained off from its doorway by an adjoining lake in 1809, when extensive foundations of apartments, that had communicated internally with the cave, were ransacked for stones for a field wall on the western side of this estate. Some fragments of vessels of

red earthenware were found among the rubbish near the altar, probably parts of the fictilla that had belonged to the altar of Mithras. Two altars and a zodiac stood with their backs toward the west wall in the front of the recess, and with the headless figure of Mithras behind the zodiac, and the fragments of the great taurine tablet before it." Mr. Hodgson likewise mentions a small altar, with a radiated bust of the sun on its capital, and an inscribed dedication to the same. The zodiacal group consists of a bust of Mithras, seated between the two hemispheres, surrounded by the twelve signs of the zodiac, and holding in his right hand, opposite Taurus, a sword; and in his left, opposite Virgo, a torch. These interesting fragments are now in the Museum at Newcastle. Returning to Borcovicus, we rested on the hill-side, and having previously well thumbed the different authorities who have treated of the great barrier, for the correction of our own observations, we whiled away a long afternoon in the discussion of the wall and its history, the following being a summary of the conclusions at which we arrived.

The northern barrier consists of two continuous lines of defence, that to the northward being the murus, or wall of stone, with its fosse, ascribed to Severus; and the inner, or southern barrier, consisting of the earthwork commonly called Hadrian's vallum; and, lying between the wall and the vallum, a chain of camps or stations, castles, and watch-towers, were connected by roads, so as to form in effect a third and intermediate barrier, covered on the one hand from the north by the wall, and on the other from the south by the vallum, which may have been intended as a provision against any outbreak of disaffection on the southern side of the barrier. The evidence for the assertion that these two barriers—the wall and the vallum—were two separate works, constructed under independent circumstances, is not so strong but that the opinion which has lately arisen, that they were only parts of one great military plan, may be held justifiable. This appears to be the opinion at which Dr. Bruce has arrived, after having made himself thoroughly master of his subject by the most scrupulous examination. In the few instances in which we find any notice of this barrier in the writings of the Roman authors who treat of the affairs of their countrymen in Britain, the reference is neither direct nor conclusive. Upon the whole, it would appear safest to take the barrier as it appears before us to have been the consolidated plan by which an entire frontier defence was effected. The stone wall extends from Wallsend, on the Tyne, to the sea at Bowness, in Cumberland, a space which is computed by Horsley to be equal to sixty-eight miles and three furlongs. The vallum falls short of this measurement by about three miles at either end, terminating at Newcastle on the east side, and at Drumburgh on the west. A marked feature in this colossal work is the determined way in which it holds its course, and the bold manner in which the wall, instead of being made to evade any natural impediment, towers over, as if by choice, the loftiest and most abrupt elevations. We have no existing fragment of the wall whereby to obtain a positive estimate of its original height, which, however, is conceived to have been probably eighteen or nineteen feet, inclusive of the battlements. It has been remarked that checks, or outsets, appear at intervals on the southern face of the wall, although the northern side presents an uniform face throughout. It is conceived by Dr. Bruce that the inequality on the inner face of the wall has occurred through numerous gangs of labourers having been simultaneously employed upon the work, and that each superintending centurion was allowed to use his discretion as to its width. On the northern side of the wall a broad fosse may be traced throughout its whole course, with some exceptions, such as where the wall travelled along the edge of a precipitous crag, in which case the fosse was not requisite. This fosse may still be traced nearly from sea to sea. In parts where the fosse travels over a level or exposed surface its northern border has been elevated, so as to offer a rampart, or glacis, on that side for the sake of additional strength. On the descent of the hill from Caervoran to Thirlwall, the fosse measures forty feet across at the upper surface and fourteen feet on its floor, being nearly nine feet in depth. Westward of Tepper Moor a portion of the fosse rises from a depth of twenty feet. "A little to the west of Portgate, near Stagshaw Bank," says Hodgson, who examined the vestiges of antiquity with a clear and loving regard, "the appearance of the fosse is still, to the eye that loves and understands antiquity, very imposing and grand. The earth taken out of it lies spread abroad to the north, in lines, just as the workmen wheeled it out and left it. The tracks of their barrows, with a slight mound on each side, remain unaltered in form."



Roman Milestone at Vindolana.

The vallum consists of three ramparts and a fosse; one rampart crests the southern edge of the fosse, two others of greater bulk are situated, one to the north, and the other to the south of

the fosse. One of these ramparts, or aggers—the north rampart of the vallum—Horsley conceives may have served the purpose of a military way; but the inequality of the surface, together with its conical shape, render that supposition quite improbable. But the fosse itself may have done good service as a covered way for the passage of troops and stores between one station and another. I am not aware if the appropriateness of the vallum for that purpose has been taken into consideration; but, supposing such to have been the case, it would equally well have served its other purpose of a barrier to the south, while it may have been employed with advantage for the protection of the soldiers in going to and fro while engaged upon the erection of the wall. The stations along the line of the wall have been planted at an average distance of about four miles. These were military cities, the permanent seats of tribunes, or prefects, and of the guard stationed under their command. The stations are invariably found in a situation which commands an abundant supply of water, and their site has been chosen with a southern aspect, and on the slope of a hill, for the sake of shelter against the cold north wind.

Horsley allots eighteen to the line of the wall; but Hodgson assumes one of the number that came under Horsley's notice to have been no more than a temporary or summer camp, and he limits the number to seventeen. In addition to these stations, as we find in taking our way along the line of the wall, are a succession of mile-castles; so designated in the modern nomenclature of wall pilgrims, from their being found at about the distance of a Roman mile from each other. They were quadrangular buildings, usually measuring from sixty to seventy feet.

Wherever the wall has been carried across a defile or river, a mile-castle has been planted on one side or the other to guard the pass. The mile-castles are found generally to have but one entrance, of strong masonry, but an exception occurs of which mention will be made as we proceed. Between the mile-castles, four subsidiary erections,

Crag Loch.

denominated turrets, or watch-towers, were placed, being little more than stone sentry-boxes. Their vestiges can now scarcely be traced. They are described as containing an interior space, of from eight to ten feet square. Horsley states the distance between them to have been three hundred and eight yards, the whole number is therefore computed at three hundred and twenty. To say that the barrier was provided with suitable roads for the transition of troops, and the ready conveyance of stores, is, in a manner, to put the assertion in an inverse order, for one great object in raising the former must have been for the protection of the line of military operations, and the road must have been the first consideration. Gordon ("Itinerarium Septentrionale") says, that two military ways belonged to the barrier; a small military way a little to the south of the wall, and, beyond it, the great military way. That there may have been a footway immediately under the wall which went from turret to turret, on which the Roman sentry marched when not exposed on the walls, is not improbable, although no traces of such a way exist. In the rebellion of the year 1715, the operations of the Royalist forces were greatly retarded by the absence of a practicable road between Newcastle and Carlisle, and the same inconvenience was experienced in 1745. Soon after this the present military road was constructed, upon the track of the great Roman road, which, in all likelihood, was laid down by Severus when he built the wall. And that the reconstruction of the whole frontier barrier is to be attributed to Severus appears, after a careful survey of the work itself, and due consideration of the opinions of the different authorities who have argued the topic, to be the most reasonable conclusion, in default of positive and contemporary testimony. Having thus satisfied ourselves we turned our faces to the sun, now declining to the west, and proceeded, still holding on to the wall, on our return to Haltwhistle for the night. The heights to the west of Housesteads overlook a prospect that reminded us of the fine apostrophe of our northern

bard, Akenside, in his "Pleasures of the Imagination."

O ye dales
Of Tyne, and ye most ancient woodlands, where
Oft as the giant flood obliquely strides,
And his banks open and his lawns extend,
Stops short the pleased traveller to view,
Presiding o'er the scene, some rustic tow'r,
Founded by Norman or by Saxon hands."

A series of small lakes, those called Broomlee, Greenlee, and Crag Lochs, lying to the north of the wall, and Grindon Loch, the smallest of the four, to the south, stretch immediately beneath the eye. Opposite to Housesteads is the brown, heathclad hill of Barcombe, or Borcombe, from which the station appears to have received its name, from the Celtic word *bar*, a height, and the Latin *vicus*, a village. On another hill, a little to the east, is a circular British camp, and round the edge of the cliff runs a covered way, terminating with a series of hollows, which are surmised to have formed the basements of the dwellings of the British inhabitants. Proceeding still west, we see the massy square keep of Langley Castle, formerly a stronghold of the Percies, from whose possession it passed into that of the Radcliffes, who held it until the year 1715, when, with other large estates, it became forfeit on the unfortunate Earl of Derwentwater falling a sacrifice in his devotion to a hopeless and disastrous cause. To the west of Langley are seen the steep serrated banks of the Allan Water and the tower of Staward le Peel, beyond which the country rises into the wild and barren solitudes of Gelston Moor and the craggy heights of Alston and Cross Fell. J. W. Archer.

A BALLAD OF THE FIVE RIVERS.

(Sung by a Punjabee.)

Now is the "devil-horse"* come to Sindh ;
Wah, wah, Gooroo! † that is true !
His belly is stuffed with fire and wind,
But as good a horse had Runjeet Dehu.

It's forty koss ‡ from Lahore to the ford,
Forty, and more, to far Jummoo :
Fast may go the Feringhee Lord,
But never so fast as Runjeet Dehu.

Runjeet Dehu was King of the Hill,
Eagle of every crag and nest :—
Now the spears and the swords are still ;
God will have it—and God knows best !

Rajah Runjeet sate in the sky,
Watching the loaded kafilas § in :
Affghan, Kashmeree, passing by
Paid him pushm || to save their skin.

Once he caracoled into the plain :
Wah!—the sparkle of steel on steel !—
And up the pass came singing again,
With a lakh of silver borne at his heel.

Once he trusted the Mussulman's word ;
Wah, wah!—trust a liar to lie !—
Far from his mountain they tempted the bird,
And clipped his wings, that he could not fly.

Fettered him fast in far Lahore,
Fast, in the mosque by the Roshunee pool ;
Sad was the Ranee Neila Kour,
Glad the merchants of fat Cabool.

Ten years Runjeet lay in Lahore ;
Wah! a hero's heart is brass ;
Ten years never did Neila Kour
Braid her hair in the tiring-glass.

There came a steed from Toorkistan,
God had made him to match the hawk !
Swift beside him the five grooms ran
To keep abreast of the Toorkman's walk.

Black as the bear on Iskardoo,
Savage at heart as a tiger chained,
Fleeter than hawk that ever flew,
Not a Moslem could ride him reined.

"Runjeet Dehu ! come forth from the hold"
(*Wah!* ten years had rusted his chain !)
"Ride this Sheitan's liver cold !"—
Runjeet twisted his hand in the mane.

Runjeet sprang to the Toorkman's back—
Wah! a king on a kingly throne !
Snort, black Sheitan ! till nostrils crack,
Rajah Runjeet sits, a stone.

Three times round the maidan he rode,
Touched its neck at the Kashmeree wall,
Struck his spur till it spirted blood,
Leapt the rampart before them all.

Breasted the wave of blue Ravee,
Forty horsemen mounting behind,
Forty bridle-chains flung free—
Wah, wah! better chase the wind !

Neila Kour sate sad in Jummoo ;—
What is the horse-hoof rattles without ?
"Rise and welcome Runjeet Dehu !
Wash the Toorkman's nostrils out !

"Forty koss he is come, my life !
Forty koss back he must carry me ;
Rajah Runjeet visits his wife,
He steals no steed like an Afreedee.*

"They bade me teach them how to ride—
Wah-wah! now I have taught them well."—
Neila Kour sank low at his side,
Rajah Runjeet rode the hill.

When he was come to far Lahore,
Long before ever the night † began,
Spake he, "Take your horse once more !
He carries well if he bears a man."

Then they brought him a khillut ‡ and gold—
All for his courage and grace and truth ;
Sent him back to his mountain hold ;
(Moslem manners know shame and ruth).

Sent him back with dances and drum ;
Wah! my Rajah, Runjeet Dehu !
To Neila Kour and the Jummoo home—
Wah, wah futteh!—wah Gooroo! §

THE SILVER CORD.

BY SHIRLEY BROOKS.

CHAPTER XCI.

"THE children?"

Those were the first words uttered by Mrs. Lygon when restored to consciousness.

"They are well, dearest," answered Beatrice, "but they are not here. I was glad to give them and my own little ones a relief from the quietness of a sick house, and all are gone on a visit to Hampstead. But I will send for them."

"Stay—no—it is better so," said Laura. "They are well, and happy—you are keeping nothing from me? They are not sent there because they are ill, or have been ill, and I away?"

"Would I not tell you? It is a holiday for them, and most glad I was to give it them. But we can so easily fetch them."

"No, dear. I have borne the separation so long that for a few hours more I will continue to bear it. There is much to do. Beatrice!" she exclaimed, the colour that had partially returned to her face again disappearing, as she held her sister tightly by the hand, "is it *there?*"

"Is what there, dear?" said Beatrice, holding her hand affectionately.

"Did you not—did you see what was speaking to me?"

"My darling Laura, why do you shudder in that manner?"

"You must have seen it."

"Tell me—what *is* it that is so agitating you?"

Laura threw her arms round her sister's neck, and sobbed violently. It was not for some minutes that she ceased to tremble, and looked up piteously at Beatrice.

"You have had enough, Heaven knows, to make you wretched, my own darling," said her sister, "but all is over now. Do not tremble so."

"What did you see, Beatrice?" she whispered.

"My love, a most distressing sight, but nothing to cause this terror. There was a violent knock, and I flew to the door—a foreign gentleman said in French that you were fainting, and I caught you in my arms. I know no more."

"You did see him, then, Beatrice?"

"Him—yes—hardly. I had no time to notice him, my dearest. If I thought at all, it was that he had seen you fainting, and had come to your assistance. I did not even thank him, I was too

much taken up with you. Laura, what does your look mean?"

"Thank him! Did you not know him?"

"No. Laura, while you speak the truth flashes on me. It was that man. It was Adair! You have returned with him?"

"No, no, no!" cried Laura, clinging yet more closely to Beatrice. "You have not heard—they did not tell you?"

"I see—I see it all—I understand your terror—it is you whom they have not told. Charles's letter said that, and it was all driven from my mind at seeing you. Laura, you do not suppose—you have no such foolish thoughts—no. That was Ernest Adair at the door?"

"Then you have *not* heard," said Laura, in pitiable agitation.

"Yes, I have heard all. I was to have broken it to you gently, but in your state of mind—there, my dearest, do not look so ghastly—it is sad, but we must strengthen ourselves for all our strange fate. Laura, you have been told that Ernest Adair was dead."

"What?—what?—Beatrice, for Heaven's love speak very quickly!"

"He escaped—it is poor Robert Urquhart who died."

With a wild cry—yet it was no cry of despair—Laura buried her face in the cushion of the couch, and wept aloud.

"That is best," murmured Beatrice. "Anything but another minute of that terror."

And she allowed Laura's tears to flow. And then gradually and with all sedulous fondness, Beatrice addressed herself to soothe her, and after a time Laura recovered her self-possession, and laid her head on her sister's bosom. They did not speak, but each knew the thoughts of the other.

Two hours later the sisters were on their way to Lipthwaite.

"You were right, dear," said Mrs. Hawkesley, after they had travelled some miles, fortunately alone. "It was better not to see her. What *could* you have said to her?"

"Much, very much, Beatrice, but this is not the time to say it. And perhaps she could not have borne to hear it."

"She bears bad news well," said Beatrice, with some bitterness. "It is for your own sake, not hers, that I am glad we came away without your seeing her. When you come back, you will consult your own feelings."

"Ah, I see that you have understood Bertha."

"Yes, and as I never thought to do. I wish that she were well enough to leave us. But we will speak of that to-morrow."

When they reached Lipthwaite, Mr. Berry was on the platform. He hastily scanned the faces that passed him, and instantly recognising Mrs. Hawkesley, was at the carriage door as it was opened. He raised his hat to the sisters, and merely said,

"The carriage is waiting."

"The carriage!" repeated Mrs. Hawkesley.

"Certainly. I had your telegraph."

"I sent none. Laura could have sent none."

"*He* sent it," whispered Mrs. Lygon.

Mr. Berry looked at them in some surprise, but seemed to consider the matter not worth conversation, and led them to the carriage.

"She will see *you*," he said to Mrs. Lygon.

No other words passed until they reached Mr. Berry's house, and the sisters found themselves in the room where Arthur Lygon had had those strange passages of war with her who now lay in the last chamber she was to enter alive.

"There is little time to waste," said Mr. Berry. "I will let her know that you have arrived."

But before he could leave the room, Hester entered with a message, desiring Mrs. Lygon to come up-stairs.

"Yes, yes, with me," said Laura, hurriedly, almost imploringly, to her sister.

Mrs. Hawkesley rose to follow.

"It is not for me to interfere," said Mr. Berry, "my part is done. But I do not think, Mrs. Hawkesley, that you will be permitted to remain in the room."

"We will see," replied Beatrice, quietly.

They were conducted to Mrs. Berry's room. It was large and cheerful, and there was little to indicate the chamber of sickness. The curtains of the window were drawn back as far as possible, the blinds were raised, and the sashes thrown open, so as to afford the inmate the largest view of the beautiful hill scene before the house. Flowers were upon the tables, and the sunshine, streaming in, did much to banish the thoughts with which a stranger naturally crossed the threshold.

"Lay in that chamber," has been written.

But it was not so when the sisters entered. Mrs. Berry, if she had been upon the bed, had quitted it, and, enveloped in wrappers, sat in an easy chair, but upright, and as one whose last thought would have been to seek sympathy, or to succumb to reproach. Her hard features had scarcely wasted with illness, and the cold eye, if not as keen as of old, was as unshrinking. Something of a mechanical smile came upon her thin lips as she watched the entrance of Laura and Beatrice, and a slight inclination of the head to the latter intimated that the dying woman was mindful of the proprieties of life, and of the courtesy due to a stranger. Of Laura she took no notice, except that Mrs. Berry pointed to a chair, an attention which she withheld from Beatrice.

"Mr. Berry is below, I believe?" she said, in a distinct voice.

"Yes," replied Mrs. Hawkesley.

"Will you, madam, do me the favour to sit with him for a short time? We shall not detain you long."

"My sister has been and is very ill," said Beatrice, gently, "and she requires assistance."

"I have been and am very ill," returned Mrs. Berry, "and I require compliance. That is, if this visit is not one of mere attention to a sick woman. In that case I am obliged, and will detain neither."

Her tone was one which conveyed an unmistakeable decision, and the sisters felt it.

"It must be as Mrs. Berry wishes, of course," said Mrs. Hawkesley; "but you will ring for me, dear Laura, if you are in need of me."

"I charge myself with the care of a lady who needs so much protection," said Mrs. Berry, unpleasantly.

Mrs. Hawkesley withdrew.

"See that the door is closed, and put down the night-bolt," said Mrs. Berry. "And do not look scared. The string is here, close to me, so that I can easily draw it, if your nerves should give way, and we should have to call in assistance. I thought that ladies who run over Europe alone were superior to that kind of weakness, and were only weak in their moral sense. Well, why are you here?" she asked, after Laura had complied with her directions.

"You know better than myself, Mrs. Berry."

"It may be so. I will tell you, at all events, what it is that you think you have come to see and hear. You are prepared to hear a womau whose days or hours are supposed to be numbered, make what is called a death-bed atonement for certain wrongs which she has done, and supplicate forgiveness from a fellow-mortal, before she goes to the great account."

"No such thought has brought me here. I know of no wrongs which you have done me, Mrs. Berry."

"That sounds like truth, yet it must be false. Who sent you here?"

"I was advised to come by one who has wronged me wickedly."

"You are speaking of Mr. Ernest Hardwick?"

The old name sounded so strangely to the ear of Mrs. Lygon that she hesitated one moment in reply.

"Mr. Adair, if you prefer the false name under which he has made himself so acceptable to married ladies."

"It was his advice."

"It was good advice, better than he has been in the habit of giving you and your family. What do you expect from following it?"

"I do not know."

"Ah," said Mrs. Berry, with a touch of the old venom. "I am right, then. You are to sit there, silent and dignified, to hear the old woman's confessions, and then to forgive me or not, as your own judgment may dictate."

"I repeat to you, Mrs. Berry, that I do not know that there is anything which I have to forgive you."

"I think that you are speaking the truth, but sit there—no, there, more in the light. Yes, you are very obedient, in spite of that proud look. You show me that you expect much, or you would not put up with my speaking to you in this way."

"If you knew what I have endured," said Mrs. Lygon, quietly, "you would not be inclined to treat me unkindly."

"What she has endured!" repeated the older woman. "True, we must spare her feelings—no one but herself has ever had to endure. Well, we must make it as easy for you as we can, Mrs. Lygon, but as you are playing a deep game, you must not be nice. You ran away from your husband, I am told, and now you want him to take you back again. Ah, you don't even rise indignantly at such words—you are in earnest indeed, and I need not have cautioned you."

"I am in earnest," said Laura, calmly.

"And you can afford to despise another woman's hard words, if you gain your point?"

"Can you, and will you aid me in my object, Mrs. Berry?" replied Laura, still calmly.

"We shall see," said Mrs. Berry, her cold blue eye resting unpityingly on the speaker. "Is that the volume of your love-letters?"

Laura crimsoned with indignation, and answered,

"This is the collection of infamous writing which the man you have named dared to lay before my brother and sister as mine."

"Be pleased to lay it before me. Nay, do not be afraid for it. If we had wished to destroy it, are you fool enough to imagine that you could have saved it for a day. Place it there, near me."

Mrs. Berry reached out her thin arm, bared by the movement, and clutched at the book, looking Laura hard in the face as she did so. Then she began to turn slowly over the leaves, here and there pausing to read a passage, and then passing on, with a strange smile. She seemed purposely to protract this examination, and when she had reached the end, she turned back, and read anew from several pages. At last she said,

"We were very much in earnest, young lady, when we wrote these letters."

Laura's look of anger was her only reply.

"But the warmth and ardour of a first love, and the want of knowledge how much we increase our power by disguising our sentiments, are plausible excuses for young persons, even when they do forget themselves, and write down things which they ought not even to think. We must make all allowance."

The studied malice of the speech defeated itself, and Laura remained in contemptuous silence.

"Penitence in our heart, if not on our lips," said Mrs. Berry, after waiting some moments to see whether she had exasperated Laura enough for a reply. "And that is the true penitence, my love. Only as you come to claim a confession from me, I think you must not be so very obstinate. Well, are you very sorry for having written these letters?"

"How dare you, as you say on your death-bed, how dare you speak such words to me?" said Laura, trembling with anger.

"That, my love," said Mrs. Berry, who seemed exulting at the agitation she had caused, "that is a question for myself. You must show a more fitting frame of mind, or I shall not be able to convince myself that you are the kind of person whom I ought to assist. Come, stoop the proud heart, and say that you are very sorry you were ever led into such evil ways, and that you are heartily ashamed of the sins of youth."

"I am justly punished—"

"Yes, love, that is a very good beginning. You are justly punished—"

"Let me speak, Mrs. Berry. Punished, by this cruel insolence, for having listened to the advice of a villain. I ought not to have come here."

"Why do you apply that name to my husband?

He has always behaved well to your family, and has not deserved such language."

"You know well that I did not allude to him."

"But I know well that it is his counsel, and not that of the unfortunate gentleman we have mentioned, that brought you here. I know that Mr. Berry went to London, and saw your sister, that lady whom I have just turned out of my room, and I have some guess at what he said to that lady, which makes it strange that she should have thought of honouring me with a visit. Mr. Berry has a remarkable attachment for your husband, Mrs. Lygon, and will not shrink at any sacrifice to show it. He has not even hesitated to bring strangers into his wife's room, on the most agitating business, when he has been made aware that her life may be an affair of hours. He is a truly kind friend, Mrs. Lygon, and one who deserves all gratitude from those he serves."

"I understand but half of what you say."

"Dare you deny that Mr. Berry has visited your sister, for the purpose of helping you to deceive your husband?"

Laura's eye fell on the book, and in that look Mrs. Berry, watchful, read an instinct to secure it and depart. The old woman laid firm clutch upon the volume.

"The book is mine, until I choose to part with it, Mrs. Lygon," she said, in an under voice of taunt. "I am ill, certainly, but I do not think that you can take it from me."

"What is the object of your insults, Mrs. Berry? I have never done you harm."

"Have you not?" replied Mrs. Berry, slowly. "Ah! but you shall never have the triumph of knowing how you have injured me, or of thinking that after all a bitter account has been but balanced."

She looked very evilly at Laura, and kept her clutch upon the book.

"I am as ignorant of having injured you, as I was that you have injured me," said Mrs. Lygon.

"You would leave me now," said Mrs. Berry, "only I have this hostage for your remaining. Well, perhaps I may pay you for your patience, but I will do it in my own way. You will not say that you are sorry for having written these sad letters—they are clever, too, in their way, but sad when we think of them as from the pen of an unmarried lady."

"If you couple that wickedness with my name again, I will ring for my sister and Mr. Berry—"

"Tear the book from the dying woman's hands, and leave the house in an access of virtuous indignation! Do. But what will you gain by that—how much nearer will you draw to the heart of Arthur Lygon? Do not be a fool, child. I hold your destiny in my hands. So, you repudiate these letters?"

"Dare you ask me?"

"Indeed I dare, with my hands upon your own writing. Is it not so, Mrs. Arthur Lygon?" said Mrs. Berry, plunging her hands into separate parts of the volume.

"You are aware of the wicked fraud. You know—you know, and you dare not deny that it is so—that you have there six letters, written in all innocence by a young girl, and containing nothing—folly, perhaps, but no wrong—that these letters have been bound up with twenty others, so shameful that no woman's hand could ever have been in them."

"Indeed?" said Mrs. Berry, with a smile.

"You *know* this."

"You are strangely positive. But you may be speaking the truth. Still, if you are, there are at least six letters here which speak of love."

"Yes, it is true, a girl's first love, when she hardly knows the meaning of the word, and when she writes from her fancy, and not her heart—there are those letters."

"And they are yours?"

"They are mine."

"So, we come to something like confession at last. I do not think that these admitted letters are addressed to Mr. Arthur Lygon—that is not the name with which so many endearing epithets are coupled."

"You know to whom they were written, and that he has long been dead."

"And our heart sleeps in his tomb?"

"The girl's fancy had been forgotten, almost the whole childlike folly, long before he died, years before I met my husband."

"So completely forgotten, that the frank and open-hearted Laura never told her husband that he was not so fortunate as to be the first possessor of her heart. Do I not know your history well?"

"You have the truth, I know not how you learned it."

"Why was this confidence withheld from Arthur Lygon? Had it been given, these letters could never have been an engine for separating you, and his generous nature would have appreciated your frankness."

"It was not given, unhappily," said Mrs. Lygon, "and it is useless to dwell upon that error."

"Why was it not given, I ask again?"

"And I cannot answer."

"Then I will answer for you. It was because the pure and candid Laura Vernon had in the meantime, and after her first love had died out, found consolation in a second."

"What?"

"In a second love, which might have been more prosperous, only its object had been already appropriated. Laura Vernon's next passion was for the lover of her sister Bertha."

"It is false!" said Mrs. Lygon.

"It must be true," said Mrs. Berry, calmly. "And her influence over him was very great—I will not say how great. Indeed, it was hard for some people to decide whether it was Laura or Bertha who had the firmest hold upon Mr. Hardwick's heart."

Laura sprang up as if she had been assailed by some venomous animal.

"A wicked, a cruel slander. And it could have come but from one person; there cannot be two persons living who are base enough to have forged such a lie. It comes from him whom I have hated from the first hour that we met, whom I have never ceased to hate, and who has haunted my life like a fiend. I thought that vengeance had come upon him at last, but he has escaped it,

and again I am met by his villany, even down here, in the very chamber—"

"Do not hesitate. I am not afraid of the word —in the very chamber of death."

"When *is* my punishment to end?" exclaimed Laura.

"You have always hated Ernest Hardwick," said Mrs. Berry, in a quiet voice. "It is an easy thing to say—now. But he was not a man to hate."

Laura's look was more eloquent than any spoken reply.

"He was a man to loathe and despise," she said. "A sordid wretch who would wring money from the terrors of two poor girls, who feared that his dangerous malice would ruin them with society, and who deprived themselves almost of necessaries to scrape together what he demanded—you are right, that is not a man to hate."

A curious look, not of dissatisfaction, came over Mrs. Berry's face while Laura spoke her indignant words. But she answered:

"Those two girls must have been in his power, or where was the force of his threats?"

"*One* was—and the second was her sister, and loved her, Mrs. Berry."

"And it is the second who is talking to me?"

And the angry crimson, again spreading over Laura's brow, was the answer to the doubt.

"Ah! we all have much to learn. I have learned something, and I must not die in debt."

She turned over and over some of the leaves of the letters, but rather listlessly, as if her thoughts were not upon the lines she seemed to be reading. At last she turned suddenly to Laura.

"Answer me a question."

"Yes."

"We are two women—alone—and whatever your answer may be, I give you the word of one who is dying that it shall never be known beyond this room, but answer me truthfully."

"If I answer at all, I will."

"Ernest Hardwick, was he ever your lover?"

"Never!" replied Laura, with indignant emphasis.

"But he sought to be?"

"He once dared to say words which he never dared to repeat."

"If he said that you gave him midnight meetings?"

"He spoke falsely."

"I think I know truth when I hear it, and I believe that I hear it now."

"You do indeed, Mrs. Berry."

"I believe it, I tell you. And, as I said, I will not die in debt. I told you that you would not hear confession and penitence from me until you had led the way. But it appears to me that you have nothing to confess and repent. I have been mistaken in you. I am not half so much interested in you, Mrs. Lygon, as I was yesterday. You seem to me to be a good sort of woman, whose kind nature made you a victim when you were a girl, and has done it again now that you are wife and mother; and as for the courage for which I was told you were celebrated, it seems to be sheer cowardice, that drives you to do things which a really brave person would avoid. Well, you cannot help your nature, but I wish I had known something more about you a few weeks ago. Will you please to go down-stairs?"

"But you—"

"Please to go down-stairs, and request Mr. Berry to come up. There, do not fear for your book. I have far more interest in it than you have. Had I been in your place, I would never have moved from my husband's home. I would have torn out the letters which I owned as mine, and thrown them at my husband's feet, and defied the devil and all his works. Why did you not?"

Laura did not speak.

"No answer. Well, fetch Mr. Berry. Yes, and request your sister to come up also. I think that both of them may like to hear, in company, something which I shall tell them. Go."

Laura obeyed the imperative word and gesture, and went down. She found Mrs. Hawkesley alone, but in answer to Laura's inquiring look Beatrice pointed to the garden, where its owner was pacing moodily among his trees.

"He only mentioned that we had nothing to say to one another, and left me. What has his wife said?"

"Nothing. But she seems to intend to make some revelatiou, and desires that you will both be present. A strange, poisonous woman, Beatrice," said Laura, in an emphatic whisper.

"A bad woman," replied Beatrice, "and it is frightful to think that she is so near her end. But we had better go up."

Mr. Berry was summoned, and the message delivered.

"If it is your wish, Mrs. Lygon, I will be present. You have a right to decide what witnesses shall be there. I tell you at once that they may hear strange things."

"And who but my husband's oldest friend should hear what is said to me?"

"That is enough."

A bell had been heard to ring, and while they spoke Hester entered again, took from one of the tables a large Bible, and went out hastily. Mr. Berry observed her, and a dark look, almost a scowl, came upon his kindly face.

"Take chairs," said Mrs. Berry, when they came into the room.

Mr. Berry noticed that the Bible was placed on the ground, close to the chair of his wife. Laura's glance was at her own volume, which still lay at the hand of Mrs. Berry.

"Dear Edward," said Mrs. Berry, in a gentle voice, "it is well that these ladies have arrived before my rapidly sinking strength leaves me, and while I am in possession of such mental faculties as it has pleased God to give me. You will be able to testify hereafter, if need, that I am perfectly competent to the transaction of business, and that I am not the victim of any of the hallucinations which are said to cloud the brain of those who are departing."

The speech was in Mrs. Berry's favourite style, and was delivered with as much precision as if it had been studied.

"You do not answer, dear Edward. It will be satisfactory to these ladies that you should do so."

"Your mind is as clear as ever, Marion," replied her husband, shortly.

"You will be ready to certify, hereafter, that such was the case," said Mrs. Berry.

"Yes."

"Then, Mrs. Arthur Lygon, and you, Mrs. Hawkesley, have the goodness to listen to me. In a few days, and perhaps in a few hours, I shall be past knowing or caring what is said or thought of Marion Berry. My own hopes for the future are based upon too secure a rock to leave me in the weak belief that any act of mine will conduce to my eternal welfare. I have made up that account, and the world has nothing to do with it. What I may choose to do now is done of my own free will, and you must not couple it with the thought that I am making an atonement for aught that I may have been led to do in other days. Of my own will and choice I tell you, I am about to make a statement which you will all remember to the day when you, like me, shall be waiting to die."

She spoke in a low distinct voice, every syllable audible to them all. Mr. Berry's thoughts were his own—Laura's were selfish—but Beatrice somewhat less painfully interested, felt, if only for a moment, a sympathy with the hard and guilty woman, who in nature's last hours was thus wilfully isolating herself, and who sat there almost defiant of those who surrounded her.

"I hold under my hand," she said, "a book containing letters, the character of which you all know. I call upon Mrs. Arthur Lygon to point out which of those letters she admits to have written. Come here, Laura Lygon, and say which are Laura Vernon's letters."

Mrs. Lygon approached the table, and as Mrs. Berry turned the leaves, Laura placed her finger on a note. It was a little note, written in a beautiful and small hand, crossed and crossed.

"That is the first," said Mrs. Berry. "Edward, take this pen, and mark the letter with your name, that you may hereafter identify it without hesitation."

Mr. Berry obeyed in silence.

She continued to turn the leaves, and the same process was observed until six letters had been marked. Then Laura, without a word, resumed her seat.

"Nothing more in this volume was written by you?"

"Nothing."

"Edward, place this Bible on the table."

She beckoned to Laura, seized her reluctant hand, and held it on the book.

"As God shall judge *you*, in *your* dying hour, you have spoken the truth about these letters?"

"I have."

"Then comes my turn," said Mrs. Berry, laying her hand upon the Bible. "I call Him to witness the solemn declaration of a dying woman, that the remainder of these letters, twenty in number, *were composed by myself, Marion Berry, and by Ernest Hardwick, or Adair, together, and were written, as they appear here, by him only.* Take note of this declaration, and to you, Edward Berry, I deliver the volume for safe keeping."

Mrs. Lygon listened with speechless astonishment to this statement. For a moment she glanced round at the faces of her companions, as if to be assured that they too had heard it. Upon the countenance of Mr. Berry there was nothing but stern composure, and he seemed as one whom no revelation could surprise or grieve. On the face of Mrs. Hawkesley had come the natural look of repugnance.

Mrs. Berry also surveyed the faces of her companions—and a defying smile rose upon the thin lips.

She seemed about to speak, when Mr. Berry said, rising,

"You have no more to say?"

"Nothing to you. Nothing to that lady, who is looking so kindly upon a dying woman."

"God forgive you—I cannot trust my tongue," said Beatrice, leaving the room hastily.

"It is well to be prayed for," said Mrs. Berry, darting an angry glance after her. "Edward, you are the master of the house, attend to your guest. Mrs. Lygon, I have another word or two for you."

Mr. Berry departed, preserving the silence he had sought to maintain throughout the interview.

"Now, you have something to ask me, or you are less than woman," said Mrs. Berry, abandoning the cold, malicious tone which she had used, and speaking almost as one who is ready to exchange a confidence for a pleasant question.

"What *can* I ask you," said Laura, "wicked, cruel woman. What had a helpless girl done to you that you should do her this wrong?"

"Nothing, it seems. But I believed that she had robbed me of the affections of the only man I ever loved in this world."

"I?"

"You. I believed that you were the mistress of Ernest Hardwick."

"You believed that?"

"Yes, I tell you. And he led me to believe it. But as I was more useful to him, from my possession of property, than you, a beggar, could be, he was willing to resign you for me, and I punished what I believed to be his perfidy to me by making him write these letters. Oh, he was well paid for every one. I always paid my debts. Each of those letters cost me gold."

And she lay back and closed her eyes, exhausted with the last effort, and Laura gazed upon her—gazed as one spell-bound.

Mrs. Berry made no sign for some time, and her stillness might have induced the idea that she had fainted. But when Laura, now eager to escape from her presence, moved towards the door, the dying woman opened her eyes, and said,

"Stay."

"Why should I stay?"

"Have you no thanks to me for a disclosure which has saved your reputation, by the sacrifice of my own?"

"Do you look for thanks, after the confession of a wrong so wicked that I can hardly bring myself to believe that one woman would inflict it on another. Make your peace with Heaven, Mrs. Berry, for indeed you have need of pardon."

"You do not offer me *your* pardon, then?"

"It would be a grievous hypocrisy."

"Yes, it would. Under the same circumstances, I would never have forgiven you. I would have revenged myself."

"I do not think of revenge. Let me leave you."

"Yes, go and take counsel with your sister. Has she given you her confidence?"

"I do not understand," said Laura. "I do not wish to understand."

"That is untrue. I have told you that it has pleased my husband, in his singular zeal for yours, to let Mrs. Hawkesley know that which Mr. Berry, had he the feelings of ordinary men, would have died rather than have told. I doubted whether he had gone so far until your sister entered this room, but I have read her face and I doubt no longer. What has she told you of me?"

"Nothing, but that—"

"Do not hesitate. I can bear it."

To be continued.)

WHAT WOMEN ARE EDUCATED FOR.

Among the observances of the London summer are now the annual meetings of the authorities of the Ladies' Colleges, which are a new feature in English society. The kinds of attention paid to these meetings, and of comment made upon them are very various. I am at present concerned with only one of the many points of view from which these institutions are regarded.

At the recent annual meeting of Queen's College (for Ladies), Harley Street, the chair was filled by the Right Honourable W. Cowper. The Dean of the College, and some of the Professors, several clergymen, and many friends of the pupils were present, as well as the main body of the pupils. Having had opportunity to see, through a long life, what men have, at this age of the world, been thinking for two generations about the education of women, I always read with interest the reports of such annual meetings as that at the Harley Street College, and amuse myself with marking the progress of opinion disclosed by the speakers. On the late occasion (July 4th), the chairman's speech was perhaps better understood in its bearings by some hearers and readers than by himself. My experience of men's minds on this particular subject satisfies me that Mr. Cowper believed himself to be exceedingly liberal in his views, so that he was doing something virtuous,—something that would win gratitude from one sex, if it did not inspire respect for his courage in the other, in asserting the claims of women to a good education. I have usually traced in the gentlemen present at such meetings a happy complacency, an air of amiable magnanimity, which it was unnecessary to find fault with,—it was so natural and so harmless;—a keen sense of the pleasures of generous patronage, in seeing that women have a fair opportunity of a better cultivation than had been given before; but it is not often that the complacency is so evident, and so self-confident, as in Mr. Cowper's speech of the 4th instant. He has evidently no misgiving about the height of his own liberality when he assumes that the grand use of a good education to a woman is that it improves her usefulness to somebody else. This is the turn that praise of female enlightenment has always taken among men till very lately, when one here and there ventures to assume that the first object of a good education is to improve the individual as an individual. Mr. Cowper has not got beyond the notion of the majority of the friends of female education, who think they have said everything when they have recommended good intellectual training as fitting women to be "mothers of heroes," "companions to men," and so on. No great deal will be done for female improvement while this sort of sentiment is supposed to be the loftiest and most liberal.

Girls will never make a single effort, in any length of school years, for such an object as being companions to men, and mothers of heroes. If they work, and finally justify the pains taken for them in establishing such colleges as these, it will be for the same reasons that boys work well, and come out worthy of their schooling;—because they like their studies, and enjoy the sense of mental and moral development which is so strong in school and college years; and because their training is well adapted to educe, develop, and strengthen their powers, and render them as wise and good as their natures, years, and circumstances permit.

Till it is proposed, in educating girls, to make them, in themselves and for their own sakes, as good specimens of the human being as the conditions of the case allow, very little will be effected by any expenditure of pains, time, and money. I am assured of this by what I have constantly heard in the world from all the parties concerned; and anybody else may learn the same fact by listening to what all parties have to say.

The founders, managers, or authorities in all such institutions may be found at times talking over the inconceivable and incredible meanness of the parents of pupils or candidates for admission. The common plea is that the boys are so expensive that there is not much to spare for the girls' education. This is no particular concern of the college managers; but there are parents who seem to think that they are doing something virtuous in coming to bargain and haggle for the greatest amount of instruction for the smallest possible sum. They would not think of haggling with the master of the public school their boys go to. They pay down their hundred or two a-year for each boy; but, when it comes to the girls, they contrive, and assume, and beg, till they get in one or two younger girls on cheap terms, or send the governess to sit by as guardian, and pick up a lesson without pay. The mothers are apt to take credit for such management, on the ground of the trouble they have with the fathers to get any money out of them for college-lessons, when a governess (if they could find a paragon of one for a reasonable salary) might "educate" any number of girls for the same terms as one. It does not particularly concern the college managers what the fathers say at home about family plans: but they hear a good deal about it, through the expositions the mothers think fit to make of their own virtue and ability in contriving to get their daughters' education done as cheaply as possible.

But this may not be a true account of the fathers' notions, I may be reminded. I rather think it is, in the majority of cases. It is not only in newspapers, in angry letters called forth by some new phase of female education or employment, that fathers inquire what possible use there

can be in learning this or that. While a narrow-minded commercial man says, in a newspaper effusion, that girls should be fitted for managing the house and doing the needlework, and that all study beyond this is mischievous; a common-place professional man says, at his own table or his club, that it ought not to cost much to teach his girls as much as it is good for them to know: that the whole college course at Harley Street or Bedford Square is more than he thinks it right to afford while his boys are at school. Not that it is a costly education: it is very much otherwise, considering its quality: but he cannot see the use of making the girls so learned. In fact, he has told his wife how much he will spend on the girls, and she may get for them as much as she can for the money.

And what are the girls thinking meantime? An old hermit cannot undertake to report their views, which are probably very seldom uttered. But it is clear, from the college reports, and by what is known in the world of the results thus far, that the young ladies are disposed to be industrious, are highly intelligent, and cheerful and happy amidst their intellectual pursuits. We may fairly suppose therefore that they either see a use in what they learn, or learn for other reasons than the thought of utility: that in school and class-rooms they are, in short, like their brothers. The boys are not encouraged to study for such a reason as becoming intelligent companions to somebody hereafter, or being the fathers of great men. The boys know that they are to be made as wise as they can be made under their conditions; that the knowledge they gain is a good in itself; and that their fathers do not, in paying their bills, pause in doubt whether they are justified in spending so much money for such an object as the enlightenment of their children. If I may guess at the secret thoughts of young girls at their desks, I should say that they have higher and truer notions of the operation, value, and fitness of knowledge in their own case than many of their parents. Possibly some of them could teach the chairman of their annual meeting that there are better reasons for their being well educated than the prospect he holds out of their "influence" hereafter—the use they are to be of in furthering the objects of men.

I am not unmindful, however, of the great advance made—the remarkable conquest of prejudice—within a few years. It required some courage, till within a few years, to speak of any sort of college in connection with female studies: and nothing short of heroism and every kind of magnanimity was requisite to make any man offer himself for a professorship in such colleges. It is very different now, though too many of my acquaintances still perpetually fall into the old notion that women have no occasion for intellectual cultivation. I have never wondered at, nor much regretted, the dislike to the very name of "college," considering what we have seen done, and heard said, in foreign institutions bearing that title. There are great joint-stock company's schools in America, advertised and glorified under the name of colleges, from which English parents and brothers would flee away, and take refuge in the wild woods, rather than "assist" at an annual meeting. The public exhibition of intellect and sensibility, the recitations, the compositions, the essays on metaphysical or moral subjects, the prize-giving, the newspaper reports of the pupils,—all this, and the dreadful hollowness and abominable taste of the whole display, might well cause English fathers to start back from the first mention of female colleges at home. So might the continental celebrations which we still witness occasionally, where the most virtuous school girl is crowned in the presence of a throng of visitors; and where virtue in detail—honour, sensibility, fidelity, &c., &c.—is rewarded by prizes and praises. But it is now understood that our colleges for ladies have nothing in common with institutions in which these terrible exhibitions can take place. Our young maidens altogether decline publicity, and could not condescend to try for prizes or accept praises. They are plainly zealous for the honour of their college; but no one of them has anything to gain for herself beyond the privileges of learning and art. There is a wider difference between such colleges as we see annually glorified in American journals and those of Bedford Square and Harley Street than between these last and the closest and narrowest education given in an aristocratic school-room, by an unrelieved governess, to two or three secluded and spiritless girls who never heard a masterly exposition of anything in their lives. But due credit should be given to such fathers of the present generation as have surmounted their horror at the name of colleges for young ladies.

The whole significance of the matter—the whole importance of the assumption involved in Mr. Cowper's speech about qualifying women by education to "stir up man" and improve the nation—can hardly be seen without reverting to some of the stages that women have passed through within two or three generations, and then turning to some recent discussions which have caused a strong sensation in London society, and a good deal beyond it.

There was a great notion of making women learned several times during the last century. We know almost as much of the reign of the female pedants as of the history of any political party in the time of George III. I do not wish to dwell on the subject, for there was nothing in the writings of the Blues of the last century which need detain us now, or which would have obtained praise in any society where women were duly respected,—which is the same thing as being truly appreciated. We need not trouble ourselves now with the Sewards, the Carters, the Veseys, Hamiltons, Mores, Montagues, and others who, without anything like the genuine knowledge now attainable by women, poured out sentiment and fancies which they mistook for intellectual products. We need not pause on these, nor criticise their works; but I must mention them, in order to recall the Blue-stocking stage of female education, and also because they are a foil to the really well-educated women of the period. I knew the Miss Berrys, and the Miss Baillies, and the empress of her sex in her own time and after,—Mrs. Barbauld. The Miss Berrys were a favourable specimen of the Blue

order: not only clever and well-read, but enlightened;—rather blue, certainly, but sensible, kindly, sufficiently practical for their position—in short, certainly the better for their intellectual cultivation, and in no way the worse for it. The Baillies were not Blue. Joanna's genius was too strong and natural to be overlaid by any amount of reading she was disposed to undertake. All the sources of wisdom were open to her;—Nature, books, and life: and she drew from them all in happy proportion; so that she became the wise and happy woman that every wise father would desire his daughter to be in herself, whatever she might also do for, and be to other people. If Joanna Baillie had written nothing, she would have been the beloved and revered being that she is in all memories. The only difference is that her lot as an author affords further evidence of the robust character of her mind, in the equal serenity with which she regarded the rise, and culmination, and decline of her own fame. No seat of irritability seems to have been ever touched, more or less, by such a celebrity as very few women have ever attained, or by that extinction of her fame, which must have appeared to her unjust, if the fame had not been itself a delusion. Less celebrated, but hardly less highly endowed, and more thoroughly educated than Joanna Baillie, or perhaps any other woman of her time, was Mrs. Barbauld, whose few but exquisite writings still kindle enthusiasm in duly qualified readers who happen to pick up anything of hers in their path of study.

Her father educated her with her brother; and we see in her noble style, full of power, clearness, and grace, one of the results of her sound classical training. We see others in her compactness of thought, and closeness of expression; while the warm glow of sentiment, pure as the sunlight, excludes all appearance of pedantry, or unsuitableness to the hour in which she wrote. Fox pronounced her "Essay on the Inconsistency of Human Expectations," "the finest essay in the English language,"—no one being more aware than he must have been of the classical origin of the train of thought, so admirably conveyed in vivid English. The strength and discipline of her moral nature were only too well proved by the experience of her married life. She underwent, with noble outward serenity, a long and excruciating trial from her husband's insanity, which ended in suicide. The "Dirge," which remains among her poems, discloses to those who knew her something of what lay under the dignity and calm which she preserved for his sake. The strain and shock induced an indolence, or reluctance to act, and make any appearance, which has deprived us of much which she would no doubt have written, if she had not lost the spirit and gaiety of her early life; but we have enough to understand how it was that her reason and fancy swayed all minds that approached her own, and her words burned themselves in on the memories of all who fell in with them. Having read anything of hers at all, it was irresistible to read it again; and probably nothing of hers ever needed to be read more than twice. Her essays related mainly to the topics of the time: and the time was one of political and moral conflict throughout the country; yet I have been eagerly inquired of by young persons within a few years as to anything I could tell of Mrs. Barbauld, because she had kindled their souls by some legacy of words which seemed to them like the newest and rarest of gifts.

Her father certainly did not train her to be somebody's companion, or somebody's mother. He treated her and her brother alike, with the view of freely opening to both the way to wisdom. Her education was a pure blessing to her. It was to her what she briefly and brilliantly describes intellectual pursuits to be in her celebrated essay. Her firm grasp of philosophy, her student-like habit of mind, and the scholarly discipline she underwent did not impair, in the slightest degree, her womanly grace, her delicate reserve, or the glow of her friendships. It is true, she was not much of a needlewoman. There is a tradition that the skeleton of a mouse was found in her workbag; but this kind of disinclination is seen in women who know no language but their own, and whose ideas do not range beyond their own street. As her husband's aider in the work of his great school at Palgrave, and as a motherly hostess to the little boys, she was tenderly remembered by some men of distinction who had stood at her knee. A nobler and sweeter presence than Mrs. Barbauld's I have never witnessed; and I have heard from some of her own generation that her sprightliness was once as bewitching as her composure was afterwards pathetic.

In the next generation after the Blues of the last century, there seems to have been a sort of reaction in regard to the education of at least the middle-class girls. As far as I have heard from many quarters, the mothers of the early part of this century were less informed, less able in even the common affairs of life, than those who immediately preceded and followed them. There were, of course, reasons for this; but I cannot go into them now. It is enough to recal to the memory of old people what they heard in their childhood of the boarding-schools, sewing-schools, and day-schools in which their mothers had received their education, as it was called. I remember the fame of a school which was always so crowded that the girls had hardly room to turn round, and none for any due care of their clothes; a school so praised by distinguished church-folk as that the list of candidates for admission was always full; a school which I might describe at some length, to the amazement of modern readers, but of which I will mention only one characteristic fact—that the religious instruction of Sunday (in addition to church-going) was learning by heart four lines of "Paradise Lost," leaving off (till next Sunday) whether there was a stop or not. There were sewing-schools, where girls sat on hard benches without backs, and without any support for the feet, stitching away for hours together, on fine materials, in any sort of light that might happen; so that a large proportion came out of the process crooked, or squinting, or with back-ache or near sightedness for life, and a sad habit of low spirits. There were country or seaside schools, where the girls learned to gather fruit and vegetables, and to play trap-ball, and perhaps to dance, as well as to

say their catechism and darn stockings; all very good, but not quite enough, according to our notions. The pupils themselves, when parents, desired more for their children; and there was a movement—I remember it well, because it involved my sisters and cousins—in favour of an education more like that of boys, and conducted chiefly by masters. It was a great blessing to the girls, but it was a random effort. In one town, most of the middle-class girls would be taught Latin, if not Greek and mathematics, really well; while in other towns, a miserable smattering of French (as English French was before the Peace) was considered enough in the way of languages, and even arithmetic, beyond the four first rules, was postponed to the piano. There was, however, a marked improvement: and the hardness of the times, introducing competition into the governess department, directed more attention upon education. From that day to this the whole conception of the objects and methods of education has been expanding and improving; and perhaps not even the city Arabs now gathered into ragged schools have more reason to be thankful for the change than the girlhood of England and Scotland. As Mr. Cowper justly observed at Harley Street, it is the well-grounded and systematic instruction, the habit of co-ordinated study, which is so valuable to the minds of women. Our Ladies' Colleges are rapidly familiarising society with this view of female study; schools are formed for the purpose of preparing pupils for the college, and the quality of governesses is rising in full proportion to the new means of training now put within their reach. Through them, as well as by natural incitements of example and sympathy, the improvement will spread from the middle classes upwards. If aristocratic parents will not as yet send their daughters to colleges, where future governesses and professional and mercantile men's daughters study together, they will soon demand a higher order of instruction from the exclusive schoolmistresses, governesses, and masters whom they employ. Hitherto their children have undoubtedly had the advantage in learning well what they do learn,—modern languages, English reading and writing, and the practice of the arts. Now, they must extend their scheme.

This brings us to my last topic,—the recent exciting discussion about Belgravian young ladies. The only part of it that I need notice here is that which seems to have excited least interest elsewhere; and that is, the actual quality of the Belgravian young ladies whose interests have been so freely discussed.

I regret the discussion, because I believe it will be injurious to English reputation abroad. No Englishman, in any part of the world, will believe, any more than his wife or mother, that "the Belgravian Lament" was written by a woman, or any number of women: but we cannot expect the same true instinct in Americans, French, Italians, or even Germans. I regret that a statement, practically libellous, has been floated at home, which will go the round of the world, and be harboured in some corner of it for future mischief. This is enough to say of the original incident, and of the mischievous introduction to newspaper treatment of the gravest and most perplexing of moral questions.

What concerns us now is,—the view taken, all round, of the young ladies of the upper classes. The notion that the aim of their lives is an advantageous marriage can be held only by men who have no acquaintance with them. Those who have may be indignant when the conception of the low-bred satirist is sent forth into the world as fact, and left uncontradicted, as the libel in this case necessarily is; but none of the associates of those young ladies will feel less respect for them now than they did six weeks ago. It needs no explaining in Belgravian, any more than other society, that mothers and daughters are not always thinking of and planning for advantageous marriage. If observation is newly excited by what has been said, it will take the turn of noting what is the aim, and therefore what the quality, of female education in that class.

I have seen something of that order of young ladies; and what I have observed obliges me to believe that they are at least as well provided with independent objects and interests as middle-class girls. One family rises up before my mind,—sensible parents and their five daughters (saying nothing here of the sons). The parents provided instruction for each girl, according to her turn and ability: and when each grew up to womanhood, she had free scope for her own pursuit. One was provided with a painting-room, and another with a music-room, and all appliances and means: a third had a conservatory and garden; and all lived in a society of the highest cultivation. They had as much as they wished of the balls and fêtes we hear so much about; and there was nothing to distinguish them from other young ladies who are now subjected to such insolent speculation from below: but I am confident that it could never have entered the head of the veriest coxcomb of their acquaintance that any of the family were speculating in marriage. Four of them married well, in the best sense, though not all grandly. The fifth died, after many years of illness. There is every reason to believe that English girls have the simplicity, intelligence, and kindliness of their order in one rank of life as in another; and certainly not least in that class which is surrounded, from its birth upwards, by an atmosphere of refinement derived from intelligence.

What, then, are they educated for? This is the great question, in their case as in that of middle-class girls.

For the most part, their education is probably a matter of sympathy and imitation. In this or that way they may best learn what every girl is expected to learn. Beyond this, there is usually but a dim notion of the object, and as little notion as elsewhere of the great single or paramount aim of education,—to raise the quality of the individual to the highest attainable point. I believe that the parents fall short of this conception, like most other parents of daughters: but I am confident that they are yet further from the other extreme,—of universally and audaciously breeding up their daughters for the matrimonial market. One evidence that is before our eyes tells a great deal. The unmarried women of the upper classes

seem to be at least as well occupied with natural and useful pursuits as those of any other rank; and more so perhaps, in proportion to their greater command of means for accomplishing their purposes and gratifying their tastes. Some may do a little mischief in attempting to do good: some may get into a foolish metaphysical school in their study of German: some may lose themselves among the religious sects of the day in the course of their polemical or antiquarian studies: but I doubt whether one could anywhere find more satisfactory specimens of single women, amiable and cheerful, because satisfied and occupied,—with friends enough for their hearts, and business enough for head and hands.

What is the truth, I wonder, about the "fast young ladies" we read so much about? I am out of the world; but I cannot find that anybody who is in it has actually seen the young ladies who talk of "awful swells" and "deuced bores," who smoke, and venture upon free discourse, and try to be like men. In Horace Walpole's time, as in Addison's, there were "fast young ladies," as we see in many a letter of Walpole's, and many a paper of the "Spectator." Probably there were some in every age, varying their doings and sayings, according to the fopperies of the time. Have we more than the average proportion? I do not know. One obvious remark on the case of the girls so freely discussed has scarcely, I think, been sufficiently made; that the two commonest allegations against them are incompatible. We hear of their atrocious extravagance in dress and peculiarity of personal habits; and, in the next breath, of their lives being one unremitting effort to obtain a husband. Now, in my long life, I have witnessed nothing like the opposition set up by men, within the last seven years, to certain modes of female dress and manners: yet the modes remain. The ladies are steady. I wish their firmness was shown in a better cause; for I admire the fashions of the day as little as any man: but it is plain that the ladies, young and old, daughters and mothers, do not try to please men in their dress and behaviour. They choose to please themselves: and, whatever we may think of their taste, we cannot but admit their spirit of independence.

On the whole, I cannot see any evidence that women of any rank are, generally speaking, educated with a view to getting married: nor yet for the purpose of being companions to men, or the mothers of heroes; nor yet for the purpose of inspiring men to great deeds, and improving society; nor yet, except in a few scattered instances, to make the most of their own individual nature. There will be less confusion of thought, and dimness of aim, when the better instructed generation grows up. Meantime, in the midst of the groping among sympathies, and sentiments, and imitations, and ambitions, and imperfect views of all sorts, let us only have some few who uphold the claim of every human being to be made the most of, in all the provinces of its nature, and the female sex is redeemed. Women will quietly enter into their "rights," without objection on any hand, when those rights consist in their being more reasonable, more able, more useful, and more agreeable than ever before, without losing anything in exchange for the gain.

From the Mountain.

OUR CRITIC UPON CRICKET.

SECOND INNINGS.

The reader may remember that I scored in my last innings some remarks upon the modern catapultive style of bowling, and some regrets that, to my thinking, the pleasure of the game has in some degree been lessened by it. We live in a fast age, and I suppose our bowlers fancy they must keep pace with the times: but I am pretty sure that certainty is often sacrificed to speed, and that many a young cricketer has spoilt his style in bowling by aiming too exclusively at quickness in delivery. The great thing to be learnt is to make sure of a good length, and to vary pace and pitch with ease as well as accuracy.

To practise this, the best way is to go out with a friend, and stand at two grounds' length apart, with a single stump between you. Peg a bit of paper, each at three or four yards from the wicket, and bowl alternate balls for an hour at a time, only scoring when you hit both the paper and the wicket. Change the distance of the former after every dozen balls, so as to acquire the knack of varying four lengths: and especially endeavour to deliver with a twist, which by beginning with slow balls you will speedily acquire, and by practice will be able to introduce with swift ones. An old bowler I knew (I believe he was among the very first of the round-handers) could pitch a ball at least a yard wide of the stumps, and yet make it shoot straight into them. I have often heard him boast that he could bowl a "bailer" that should pitch behind the batsman: and after hitting round at what one thought a safe leg-ball from him, I have often been disgusted to find it take the wicket.

Good bowling is so vitally essential to good cricket, that I wonder that more pains are not taken in the practice of it. The annual defeat of the Gentlemen by the Players, which is becoming every year, it seems, more sure in its recurrence, I attribute in chief measure to the fact that as a rule the Gentlemen bowl badly, because they never practise it. Last year at the Oval, the Players beat them in one innings, with near 200 runs to spare: and at Lord's this year a like defeat occurred, the Players scoring, in their one innings, 246, while the Gentlemen made 70 and 116. The return match, too, the Players have won easily in one innings, making the large score of 358, while the Gentlemen scored 154 and 136. This result I see is, in the "Times" account assigned to "the fine bowling of Jackson and Willsher throughout, combined with the general good fielding of the Players:" but there is no doubt the inferior bowling of the Gentlemen had quite as much to do with it. Of course it would not be in reason to expect an amateur to bowl as well as a professional without like constant practice; and gentlemen, it may be said, have neither need nor wish to take up cricket as a business, and so give up much time to it. But surely if they can spare time to practise it at all, they ought not to confine themselves exclusively

to batting: at any rate, if they intend to keep on foot their annual match with the professionals, they ought to try their hand at bowling every now and then, if only for the purpose of preventing such preposterous defeats as have been witnessed. Some few years ago the sides were much more equal:* but since it has been common to employ professional bowlers in almost every match, the bowling of the Gentlemen has more and more fallen off, and the victory of the Players been more and more made safe. As a preventive of the ludicrous defeats which are sustained, I see a writer in "Bell's Life" suggests that matches should in future be played by eighteen Gentlemen against eleven Players, or else that numbers should be equal, but the Gentlemen should have a brace of bowlers given them. This, of course, would make the sides more equal than they have been, but the match could be no longer viewed with special interest, nor regarded as a trial of our amateur opposed to our professional strength and skill. For my own part, I detest a game where there are more than eleven in the field. Cricket, to *be* cricket, must be played by two elevens: and each side should be truly that which it is called. If the Gentlemen play the Players, they should all of them be gentlemen, and not let their hardest work be done by bowlers from the other side.

The plan of hiring a professional as bowler to a club no doubt tends very much to the improvement of the batsmen; but I regret to see it made, as it is often, an excuse for gentlemen to give up bowling altogether, and for getting it done for them, not merely upon practice days, but when they play a match. Generally speaking, more depends upon the bowler than on any other man; and when the Ballborough Eleven brag of having smashed the Stumpington, I incline to give the laurels where they are justly due, and to chronicle that Slowsure, the Ballborough paid bowler, proved a better man than Roundshot, the professional of Stumpington. Why men don't practise bowling, merely for the pleasure of it, is more than I, who used to revel in it, can pretend to guess. If you play simply for exercise, as many a man does, a few overs will do more for you in sudorification than will any other field-work; and as for fancying that a bowler only comes in for hard work, and has no real enjoyment in it, the man who can say that has never drawn a wicket.

Batting is well enough, and there is certainly a savage sort of luxury in making a good slashing hit; but of all the joys of cricket none equals the delight of scattering the stumps. You feel the same kind of pleasure as when you win a well-contested game of chess. You pit yourself against a man, and he defies you, and you beat him, and when his wicket falls you feel yourself superior, and your glory is the more because you say, "Alone I did it!" I think the joy of ripping out the middle stump of a good batter surpasses even that of wiping a man's eye at an overhead cock-pheasant, going down wind at the rate of forty miles a minute, or of clearing an ugly-looking brook or bit of timber, which has been a baulk to some of the best-mounted in the field.

It is a great pity, I think, that bowling is not practised more than it now seems to be, and that young players are not warned that pace is not by any means the most important point to aim at. It would seem now that in bowling there's a mania for speed, as there is in dancing, hunting, and in shooting. But the old waltz is by far more graceful than the deux-temps, and the best of shots and riders must acknowledge that good sport is often sacrificed to pace. So the fastest balls prove often less effective than the slowest, and have this further disadvantage that, by mere force of recoil, they fly further when hit. Moreover, as a rule, a man can bowl more steadily when he does not strain himself to keep up a great pace, and many a match is lost by the bowlers putting on too much steam at the first, and thereby tiring themselves out before they have half done their work. "Take it easy," is the best of rules for a young bowler: and, however hot the day be, mind you keep your temper cool. When once a bowler gets "put out," he will have small chance of putting out the batter, and the safest thing to do with him is to treat him as a tea-kettle, and, directly he shows signs of boiling over, take him off.

Whether it be worth paying a couple of hundred pounds a-year for the privilege of learning to pull well and play cricket, is a point which I shall leave to Her Majesty's Commissioners who are appointed to inquire into the state of education at Winchester and Eton and our other public schools. It is, however, certain that whatever other benefits their system may confer, it tends more than any other to make good oarsmen and good cricketers. Excepting in the holidays, we at Greyfriars had small chance of getting up our rowing, but for cricket we went in with all our spirit and our strength; and, considering the limited extent of the Lark's grassplat, which served us for a cricket-field, our prowess at the game was, to say the least, praiseworthy, and such as any old Greyfriars man might well feel proud to see. It was a great grief, I remember, that we could not test our strength at Lord's, by playing in the annual tripartite scholastic games. *Eheu fugaces!* other memories than ours must now bewail those happy times! What could have induced the masters of those other schools to forbid a pleasant meeting which both men and boys looked forward to and annually enjoyed, it is not my present province to inquire. But I cannot help dropping a tear of sympathy for those who, being Wykehamists, must have felt the loss even more than I, though every public schoolman has reason to bewail it.

But though we at Greyfriars could never play at Lord's among the "glorious Three," we had our annual matches of the Past *versus* the Present,—the Men against the Boys. And jolly meets they were, and are, too, I doubt not; only I fear the roundshot bowling has somewhat rubbed the fun out. Oh! how for days beforehand we would talk about the match, and watch with growing interest the practising of our Eleven, who trained daily for the game. And then, when the day came, how hastily we swallowed down our lunch

* The matches which were played in the years 1842, 1843, 1846, 1848, 1849, and 1853, were all of them decided in favour of the gentlemen, who since the year last mentioned have not won a single match.

of bread and soap (as we with annual jocosity christened our school cheese: this being, by the way, the only day in all the year we had the chance of tasting it), and how eager we rushed out to see what old fellows had come, and to hear what rumours were afloat anent their playing. The ground had been marked out at least a week ago (and woe-betide the fag whose foot between whiles had been seen on it!), and long before breakfast the wickets had been pitched, and an Argusy of eyes had tested their exactness. What a cheer there is when our Eleven win the toss, and magnanimously suffer their opponents to go in: and what handclapping there is as every wicket falls, and how we hope our shouts of triumph will strike terror to the foe, whom we impartially abstain from in any way encouraging. Haply one of the masters plays, to fill a vacant place, and then how we rejoice to see his stumps sent flying, or to laugh at him when scampering for a ball he should have stopped. But our loudest exultation is when one of our Eleven hits a "skyer" over Cloisters, or far into Under Green, and after running a good fiver scores another one or two by a clumsy throwing up. Shrill hurrahs and rounds of hand-clapping salute the heroes as, to rest themselves, they sit upon their bats: and the only damper thrown upon our spirits is when, perhaps emboldened too much by our applause, one of the heroes not long after by a sad fate gets run out.

Nor was our pleasure over with the ending of the game: for after it came the supper (known to us as the "tuck out"), and to some inglorious minds this was by no means least looked forward to among the day's delights. The "Uppers" of the school enjoyed the envied privilege of sitting down with the "Elevens," and when their *fames* was *exempta*, and they got up from their seats, we fags who were in waiting made a rush into their places, and feasted on the fragments as fast as we could eat. Kind masters would secure an emptied pie-dish or a salad-bowl, and fill it before leaving with whatever their fags brought them, so that layers of cold fowl would alternate with strata of raw currants, creams, and custards, and on a tipsy cake foundation would be raised successive storeys of jam-tart and lobster salad, grapes, trifle, and spiced-beef. *O dura ilia puerorum!* What would aldermen not give for the elastic powers of appetite wherewith we used to pitch into these horrifying mixtures, and the freedom from dyspepsia evinced by sleeping after them! Other cricket-suppers than those enjoyed at Greyfriars live yet among my pleasantest remembrances. Will the next age have the like joys to look back upon? Except in the remotest of our rural districts, cricket-suppers are becoming sadly out of fashion, and I fear it is considered somewhat vulgar to indulge in them. Late dinners perhaps have helped to put them out of date; but whatever be the cause, I think it a great pity that they should be extinct, and I hope to see, ere long, an effort made for their revival. Not that I agree quite with the widely-accepted maxim that we Englishmen can do nothing, whether in business or in pleasure, without plenty of eating and drinking. But the meet after the match affords a pleasant time for chat, and many a life-friendship which is first formed upon the field is cemented in the supper-room. Men now are much too business-like to please me in their pastimes. They hurry home from hunting as they do out of a theatre, and they cut away from cricket, scarcely bidding a good-bye, and as though glad to get it over. Now this is surely an ill-compliment to those they have been playing with, and for many other reasons I think it a mistake. The drive through pleasant country from a well-contested match is to me far more enjoyable when taken leisurely and calmly in the cool of the late evening, with one's supper safe inside one, than when you hurry off the ground as hard as you can pelt, hot, and, may be, hurt, or freshly smarting from defeat.

I have had some slight experience in getting up a club, and know a little of the duties of those who undertake its management; and I think success depends in a very great degree upon the rules laid down at starting for the management of matches, and the spirit of obedience, good temper, and good-will with which such regulations as seem needful are observed. In choosing an Eleven, I consider it essential to elect a proper captain, and, when chosen, to invest him with absolute authority. It saves a world of trouble to place in his sole hands the appointment of the field, and uncontrolled decision in cases of dispute. Many a match is lost for want of a good general; and if the captain be held responsible for failure, he will keep his wits about him and lose no chance to win. It will be for him to say when to try a change of bowling (I have often seen a wicket drawn by taking off a good bowler and putting on a bad one): and his practised eye will note the style of play in each new batsman, and tell him how to vary the disposal of the field. Nothing more displays the skill of the professional Elevens than their quickness in discovering the favourite hits of players, and taking steps to stop them. A peculiar hit is made, and a run or two obtained; a similar ball is bowled and it is similarly hit, but by the beckoning of the captain a fieldsman has been moved, and the player is caught out. Very many of the victories the Elevens have obtained over Sixteens and Twenty-twos have in great measure been gained by dodges of this sort: and young players may learn much by watching such good generalship, and seeing how to take advantage of an enemy's weak points.

As a rule, I fear that fielding is terribly neglected, and, like bowling, is not practised half enough by amateurs. We at Greyfriars used often to have afternoons for practice, thirteen only playing, so as to have two batsmen in rotation at the wickets and the rest at their appointed places in the field. There cannot well be sides in such a game as this; but to keep the interest up it is as well to take the score, and the man who makes most runs may be held winner of the game. At any rate, such play is vastly more improving than a game at "tip and-run," which is all very good fun for muffs who only blind-swipe, and have a wish to exercise their lungs as well as legs. And it is vastly more amusing, at least in my opinion, than the "practice" that one sees upon nine club-days out of ten, and which consists in simply pitching some half score of wickets some

half dozen yards apart, so that nobody, of course, can hit to leg or point without the chance of breaking some one else's head. There is certainly excitement in practice of this sort, but I must confess that it is not much to my taste; and, after all, such play is terribly slow work, for the players loll and smoke until their turn comes for the bat, and if you are so unlucky as to make a slashing hit, you have to bellow out "Ball, thank you!" until you are half hoarse, and even then the chance is you must go for it yourself.

But what is better than good generalship, and more important to good cricket, I consider it essential that there should be good fellowship. As cricket is a sport, and is merely played for exercise and healthful recreation, it never should be played but with good feeling and good humour. No matter who wins, they who lose their temper I can but hold to lose; and I would say to any cricketer, if you cannot play without squabbling, you had best not play at all. I have heard of deadly feuds between two rival country clubs, and how the Swipewell never played a match with the Long Stopperton without the day's fun ending in a wrangle and a fight. But I hope these bad old bulldog times are past, and, although the fire of rivalry may be as hot as ever, I trust players are too sensible to let their temper become heated by it. No man has a claim to be considered a good cricketer who allows himself to show a sign of anger at defeat. I recollect once playing in a match where our antagonists, against express agreement, brought a paid player to bowl. The ground was hard and rough, and we thought this bowling dangerous; but he pledged his word that he would moderate his pace. Rather than not play, we therefore waived objection, and for the first innings he contrived to keep his word. But when I drew his wicket with, I think, my second ball, he broke his bat upon the ground in a sudden fit of rage (an act which, had I been their captain, would certainly have got him his dismissal on the spot), and when we took our second innings he bowled with all his might, and I especially came in for a full share of his wrath. It is not because my legs were next day black and blue that I treasure the reflection that this was no true cricketer, however good a player he may have been and is.*

Some may think that it may be from such remembrances as these, and because I have poor pluck and cannot bear a good bruising, that I have protested against the fast round bowling. But this indeed is not the case. My chief cause of objection is not at all one based on any personal antipathy to having my legs pounded to the colours of the rainbow, or to losing half my beauty by getting a black eye, or having (say) the bridge of my finely-chiselled nose smashed. I object to round-shot bowling mainly on the score that, to my thinking, it lessens the enjoyment of the game. Few people can face a really swift round bowler without feeling somewhat nervous about their eyes and limbs; and although, by constant practice, such feeling may wear off, they can never be completely at their ease when at the stumps. I think much more amusement may be got out of the game when there is less danger in it; and though I have small wish to see young men made mollycoddles, and funky of hard knocks, I think games, to *be* games, ought to have some fun in them. I admit there's more variety in round than under bowling, and I have no wish to see the round become extinct. But, judging by what daily one reads about "the slows," it surely cannot be said success is always with the swift; on the contrary, although there may not be such "devil" in them, I think, with proper practice, the slows may be destructive as the rapids of Niagara. And why I cry out for slow bowling is, that I consider much more real fun and real pleasure is produced by it. When a ball is discharged as from the mouth of a six-pounder, you must look out for your legs, or you'll have no legs to look to. But with slower bowling you have leisure to enjoy yourself, and instead of standing swathed up at the wicket like a mummy or a mute, you can laugh and chaff with those who are about you, without fearing that your laughter may be turned by a leg-ball to the wrong side of your mouth. As they are played at present, the only fun in matches appears to be in the queer names which are oftentimes assumed; but to call yourselves "Anomalies," or "Amalgamated Duffers," appears, at least to my thinking, a rather feeble joke, and one I am by no means disposed to join in laughing at.

No one ever heard of a third innings at cricket, or it would be easy to write another paper on the points I have not noticed. But I think I hear the editor, who is my umpire, crying "Time!" and so I must cut short what more I have to say. Some people seem to fancy that, as men get more luxurious, cricket may die out: or that the love of rifle practice will gradually supplant it. I have little fear, however, of either of these deaths for it; in fact, I quite believe that so long as there are Englishmen, so long there will be cricket. The love of out-door exercise is much too strong a passion with us ever to die out, and cricket is a sport in everybody's reach; and one, therefore, that the "Million" will be sure to keep on foot, if ever it be neglected by the "Upper Ten Thousand." H. Silver.

* I think I ought to add that, in a dozen years' experience, this has been the only case in which I have ever found a hired player misconduct himself. As a rule, professional cricketers are in their behaviour all that one can wish; and one very rarely hears a foul word from their lips, as one does too often from watermen and jockeys, and other paid professors of gentlemanly sports.

STOCK INCIDENTS OF FICTION.

Novel-writing is an art that is getting more and more difficult every day. Originality being one of the chief merits of a novel, every original thought in a novel strikes off a chance for all succeeding writers. Given that there are a certain number of characters in the world, every time one of these is drawn and held up in a book to public view the task of finding a new one becomes more difficult. It is very like the Salmon fishery. Time was when Salmon were for anybody's catching. Now it is by no means so easy to get them. Imagine, then, some character fishery, in some intellectual river—somewhere. Thither go your character-catchers and fish, and

Peril of Amelia and Fido; courage and devotion of Orlando. (See page 185.)

fish. Then back they come to sell. "All fresh! all fresh!" The hungry public buy, and get some fresh, some tainted, some very rotten indeed.

It may be said, of course, that the stock is inexhaustible, for it is as wide as the world; that as no two sheep's faces are the same, so no two characters are the same—granted—granted. And if only men of first-rate ability wrote novels you would meet with no repetition, but as many novel-writers can see only the broad distinctions in character, and as many characters are only distinguished by minute touches, so in many novels you find either monsters, or persons with "no characters at all."

As with characters, so with incidents, and if repetition be blameable in the former case, it is still more so in the latter. Variety of incident is much easier to obtain than variety of character, and yet remark the coolness, the brutality with which authors ride incidents to death. Why, you might trace the pedigree of many of them, and as old families boast of having come in with the Conqueror, you will find that in general these incidents "came in" with that great conqueror, Sir Walter Scott.

But it may be urged that these things constantly repeat themselves in real life, then why should they not be repeated in fiction? Yes! but names constantly repeat themselves in real life, but you don't think of giving the hero of your novel the same name as another man's hero. An author would think twice, I fancy, before calling his hero Edgar Ravenswood or Guy Mannering, yet he has no hesitation about taking Scott's incidents and putting them into his own tale. Oh! when are we to hear the last of that terrible water-party where nobody is drowned? Of that house on fire where the lover extinguishes all the professional firemen? Of that man who is supposed to be dead and yet isn't? Of that uncle who is always turning up at last, just when he is wanted? Of that dear old hardworked, ill-used, bellowing, harmless bull?

Now observe! Here's a novelist has got his handsome, virtuous, but low-born young man, desperately in love with his beautiful, virtuous, and high-born young woman. What is he to do? The affection is mutual. These two young people are admirably fitted for each other in all respects but this one of difference of rank. What is to remove this dreadful bar? The Earl is inexorable. "Dares the low-born caitiff to aspire to the hand of my daughter—ha! What will become of society—ha! when the insects in the dust—" and all that kind of thing. The Countess won't hear of it. "Disgracing your family, Amelia, in such a way. What will the world say? Think no more about it, my dear; the County Paris dines here to-night." But the County Paris will talk his small talk and display his many attractions to no purpose. Our novelist has all the regular remedies at hand. He considers which he shall take. "Fire!" says our novelist. "Blazing rafters—falling beams—shrieking women—shouting men—engines dash up—firemen stand appalled—Orlando breaks through the crowd—plants a ladder—ascends—disappears into the smoke and flame—crowd waits in breathless silence—Orlando reappears, bearing in his arms the Earl, the Countess, and Amelia—shouts rend the skies. Or shall we try water?" says our novelist. "Water-party—boat overset—Amelia precipitated into the foaming torrent—the wretched parents, with streaming eyes, entreat the company generally to go in after her—the company generally decline—the Earl himself—an old man and feeble, but with all a father's feelings strong within him—throws off his coat, and prepares to breast the flood, but he is held back by the Countess, and by the company generally, who prefer saving the parent on dry land, to taking the water to save the child—all hope seems past, when suddenly a figure is seen to spring from the opposite bank. Swiftly it cleaves the parting waves. Will he reach her in time? No! yes! No! yes! He does! He clasps her in his arms! She is saved! and by whom? Who is the happy man? Who? Orlando." Of course: our novelist sent him on purpose. And what can the Earl refuse him after such a service? "Young man," says the Earl, "you have restored to me my daughter. The life that you have saved she shall dedicate to you. Take her and bless you! Bless you both, my children!" Our novelist may wipe his pen in peace after that.

But if neither of these suit him, that is to say, if he has used them in his previous works—for, otherwise, they would be sure to suit him—there is the uncle for him—the novel-uncle—and surely never relative was so useful. He has, in general, been in India for many years before the first volume opens; and, indeed, for two volumes and a-half, the reader is only kept aware of his existence by some such sentence as this, now and then introduced: "I have here a letter from your uncle Nat. He has had an attack of yellow fever that nearly brought him to his grave." Or, "Your uncle Nat, when hunting in India some time ago, fell from his elephant into the very jaws of a royal tiger, and had he not had the presence of mind to——", or something of that kind. Of course, being in India and making your fortune are synonymous terms in a novel, so it is quite unnecessary for the author to state that uncle Nat is immensely rich; equally unnecessary to say that he has no liver, is passionate but kind-hearted, provokingly particular about trifles, and a bachelor. About the time that the third volume is beginning in England, then the uncle finds that the climate of India is seriously affecting his health, and that his native air is the only thing to restore him; he therefore determines to return home, and sails accordingly, of course without sending notice of his coming. Things, in the meanwhile, are going on very badly with the lovers. Orlando, in addition to his other trials, has poverty to contend with; or, perhaps, as our novelist always has the uncle ready if matters come to a crisis, Orlando has run into debt. Well! about the ninety-sixth chapter, things get to their worst and mend. The lover, despair in his heart and bailiffs in the kitchen, is utterly at his wits' end. He does not know which way to look, except towards his razors. While he is meditating whether to commit suicide, or to

abscond and leave his lady-love, his servant—an old man, faithful and familiar, who has spent his life in the service of Orlando, his father, and grandfather—enters with a note. It is from Amelia. "We must part. All hope is extinguished. Oh, my Orlando!—but I must no longer call thee so. Filial duty—parental anger—must see thee no more—shall never love another—forget me—farewell!" Page blotted with tears. Orlando reads the note twice—crushes it—kisses it—grasps his brow with his extended hand (though how on earth he manages to do that, I can't for the life of me explain; but, if anyone doubts that this is a regular novel action, I am prepared to quote chapter and verse to prove it; the name of a novel in which the hero does it is even now trembling on my tongue—but I forbear;)—gasps—chokes—and strops a razor. Our novelist's eagle glance perceives that the moment has arrived. He closes his telescope, like Wellington at Waterloo, and orders up the novel uncle. What follows needs little explanation. The razor is returned to its case. The bailiffs are sent away satisfied. Orlando and the uncle drive to Amelia's house. The money-bags overbalance the noble birth. The County Paris gets his dismissal and Orlando the lady, and the novel concludes in the regular 'Morning Post' style.

Another remedy which our novelist has at hand for a bad case of crossed love is the man who is supposed to be dead. This is sometimes the lover and sometimes the rival. I have known instances in which the lady's father, who at the time was opposed to the marriage, had to undergo this temporary snuffing out. But most frequently it happens to the lover himself, and the means vary according to the period of which the novel treats. If the time is the knight-errant romantic period, the cause of the supposed death is an affray with hostile knights. In the time of Charles I., it is a fight with Cavaliers or Roundheads, as the case may be. In later times highwaymen are in general the instruments. After highwaymen the pressgang had its day. In novels treating of the last twenty years authors have been a good deal puzzled. Supposed death by drowning is the favourite. A fall while hunting has had its supporters, and the accidental discharge of a friend's gun in a turnip-field is by no means uncommon. Duelling, too, still has its victims—in the novel. But if our novelist has exhausted all these means, he has only to take his hero to Italy, where he can get him assassinated, or nearly assassinated, quite consistently. The period makes not the slightest difference there.

"By the bones of Saint Jerome," said the leech to Sir Adrian, "an the steel had pierced but the twentieth part of an inch farther, the haughty Inglese had gone the dark road. Assist me, Sir Knight, to remove his armour."

"Certain death must have ensued," said the Doctor, "if the stiletto had gone a shade deeper. You'd better telegraph, Mr. Jenkins."

The sixteenth century, or the nineteenth, it does not matter—assassination is popularly believed to be the custom of the country, and the novelist ought to be thankful that there is one place left where he can have his hero romantically stabbed without the charge of extravagance being brought against him. Well! We must suppose the lover stabbed, but not killed. The effect is that the lady, shocked at the intelligence of his death, falls ill. Gradually she gets weaker and weaker. Nothing cheers her; nothing amuses her. The light leaves her eye, the rose her cheek, and her silvery laughter is heard no longer. Her parents, who were at first rather pleased that the objectionable lover was got rid of, begin at length to fear for their child's happiness, then for her life, and end by bitterly regretting that they ever opposed her wishes. The County Paris, finding that there is no hope of success for his suit, retires, and our novelist, seeing all hindrances removed, sounds trumpets and the lover lives again.

When the supposed defunct is the rival and not the lover, a most extraordinary change takes place in his character. It is just as if the novelist had consented to let him live, on condition that he behaved better for the future. Some arrangement of this kind is absolutely necessary, for it is quite evident to every one that if he continues to act as he has been acting for two volumes and a half, there is no hope of the right people being married at the end of the book. So the novelist is compelled to take desperate measures with him. Accordingly the rival disappears for a time. People suppose he is dead. Everything goes on beautifully without him. The lady is delivered from his importunity: the lover from his rivalry. The parents are on the point of giving their consent to the marriage, when suddenly he re-appears. Oh! thinks every one, it's all over with the lovers now. Not at all. He is quite a changed man. He disappeared a cruel, malicious, selfish villain: he re-appears a mild, peaceable, benevolent creature, with no wish but for the good of his kind. When he disappeared he was the great opponent of the marriage: when he re-appears he is its great promoter. In fact, he seems to have absented himself for a time merely to "throw away the worser part of him," and to have come back determined to "live the purer with the other half."

But what is our novelist to do if he has already made use of all these stratagems in assisting other ill-starred lovers? How is he to help Orlando and Amelia then? How is he to help them! Why he has not yet employed the most favourite of all remedies for unhappy love affairs,—the specific, the grand specific, the novel bull.

Listen. Amelia wearing a red shawl (the heroine always puts on a red shawl to go into the field where the bull is) is walking through the verdant meadows with Orlando. When they reach the middle of the field (crafty animal that bull!—always lets them get to the middle of the field), Taurus shows himself, and bellows.

"Walk quietly to the gate," says Orlando, "I'll take off his attention."

(Wonderful how easily the novel bull will allow his attention to be taken off!)

After a short hesitation Miss Amelia walks towards the gate, leaving the red shawl in Orlando's hands. Taurus stares as if he scarcely understood this arrangement, finally does a little bellowing, and trots forward; Orlando shouts and waves the

shawl; Taurus stops, stares, and again trots forward. More shouting and waving of the shawl; more bellowing and trotting. By this time Amelia has reached the gate; Taurus being quite satisfied about this makes his rush; Orlando then performs astounding feats with stones and his hat, steadily retreating at every opportunity. Finally, with all the skill of a matador, he blinds the bull with the shawl and escapes through the gate. The Earl, who has seen all this from his study-window, now comes forward, places Amelia's hand in Orlando's, blesses them with many tears, and then they all go in to luncheon. The bull observing this from his side of the gate, apparently thinks it a good idea, and returns to his pasture. That is the regular course. Sometimes it is varied with labourers armed with pitchforks and hoes, but it comes to exactly the same thing in the end: the bull is foiled and the lovers are made happy.

The principal attributes of the novel bull appear to be these. A great taste for stamping, bellowing, staring, lashing himself with his tail, and digging up the turf with his horns. All true to Nature, doubtless, but still rather wearying on the tenth or twentieth recital. Then good-nature and forbearance are very strong points of his. For he never really hurts the lady after all. He's only in fun. A careful study of the novel bull has assured me of this fact, that he never makes his rush till the lady has got to the gate. Still further, he never hurts the lover. He makes rushes at him, he stamps on his hat, sometimes sends his horns through his coat, but hurt him! not for the smiles of all the cows in England. Like the lion that will not touch the true prince, the novel bull will not touch the true lover. He is "as valiant as Hercules—but beware instinct." Hurt the true lover! He would die first, as did his great ancestor, who founded the family. Yes. That bull that ran at Lucy Ashton and was shot by Edgar Ravenswood, in dying gave life to hundreds. It would be impossible to name half his descendants. Sometimes they appear in herds; sometimes singly; sometimes you have both the single bull and the herd. But however, or whenever, the novel bull appears, it is for a good purpose: to show the daring of the true lover, or the cowardice of the false; to excite the affection of the lady, or the gratitude of the parent. How bad soever things may look, let the bull once show his face and they are sure to mend. Oh! heroes and heroines, fear him not for the future. Though his bellow may sound very harsh, it is in reality "an amiable low."

Bless the bull! all the novelists that ever made use of him, and their name is Legion, ought to subscribe and raise a statue to him. It would look well in Trafalgar Square, and should stand near Jenner's. People would think it had some reference to vaccination. Bless that bull! In how many love affairs has he not assisted? How many stern parents has he not softened? Oh yes! If you are in love with Virgo, the Virgin, pray for the aid of Taurus, the Bull.

Now these are a few of the commonest novel incidents. I don't deny that they are all quite natural and very effective, but though we may still feel the thrill of excitement when we read of the house on fire and the water party, though that rich old uncle and that good-natured bull may still be dear to us all,—as how could they be otherwise after so long an acquaintance,—yet surely novelists might shape their ends with means a little more original—a little less hackneyed than these. I think—if it is not so, I am greatly mistaken—I think the word novel has some connection with novelty. Why does this connection hold good in etymology alone?

USURY AND USURERS.

The newspaper readers must often notice a certain class of advertisements in some of the London papers announcing that "Officers on full pay, clergymen, reversioners of real or personal property, and heirs to landed estates can be confidentially advised on loans for long or short periods on liberal terms. Address X. Y. Z., &c."

It is in vain that Hogarth painted his wonderful pictures of the Rake's Progress, and that the oft-told tales of ruin appear in the annals of the Insolvent Court; for, in spite of these constant warnings, there are numbers of young men—and middle-aged men too—who will drink their fill of pleasure at any price. The simple act of writing his name across a little strip of stamped paper will furnish young Scapegrace with horses, carriages, opera-boxes, Richmond dinners, and drags for the races—in fact, with the aid of bill discounters, he can procure for himself a prominent place in the fashionable world.

The bill discounter has nothing to do but to sit quietly in his handsomely furnished chambers ready to receive his victims, like a spider in its web watching for flies. Let us christen the fashionable bill discounter Mr. Lasher: I never knew any one of that name, so it is a harmless coinage. His chambers are at the West End, and are generally artfully arranged, so that the client going in never meets the man who is coming out. Lasher's habits are expensive. His horses and carriages are showy; his house in the suburbs of London is gorgeously furnished, and Mrs. Lasher's diamonds sparkle brilliantly as she sits at the head of her table on grand days when Lasher entertains some of his customers.

If Lasher is not an attorney, he is sure to have a brother or relative of some kind who is; and when poor Prodigal comes home with nothing to show for his riotous living but a writ in the action of Lasher *v.* Prodigal, the family solicitor has only to glance at the attorney's name on the back of the writ to see whether Lasher's, or Mordecai's, or Israel Solomon's gang have robbed the unhappy defendant.

Probably the most frequent victims of bill discounters are young fellows in the army. If a youngster takes a fancy to cards, billiards, racing, and similar expensive amusements, it will be a long time before he discovers that all is vanity; and unless he has the purse of Fortunatus, he must fall into the hands of the bill discounters. Nor is the temptation of raising money confined to London. The leading bill discounters have agents in every garrison in England, Scotland, and Ireland, and no doubt in the colonies too. It

seems but yesterday that poor Greenhorn, captain in Her Majesty's 200th Regiment, came to the writer hereof with a writ in his hand for a very large sum for which a certain Mr. Mordecai had sued him. Now I took great interest in Greenhorn's affairs, as I had known him from boyhood, and on more than one previous occasion I had saved him from the Philistines.

Of course poor Greenhorn (he is dead now, and his bones rest many thousand miles away from England) was *enthusiastically* repentant. "Indeed, old fellow," he said, "I *would* have kept my word, and would *not* have touched another bill; and I never did till that infernal Lasher came into my quarters at —— and began chaffing, and *forced a hundred on me.*"

It was the old, old story. The first transaction of the new lot of bills was a bill for 100*l.* at two months for 90*l.* down; then came a second bill at the expiration of two months for 100*l.* for 70*l.* down, the deduction of 30*l.* being accounted for as follows: interest on original bill for two months longer, 10*l.*; interest on new bill for the current two months, 10*l.*; and *bonus on renewal of bill No.* 1, 10*l.* When bills one and two became due, Lasher *of course* was short of cash, but turned over poor Greenhorn to Mordecai—an inferior shark who takes the leavings of the bigger fish—and Mordecai had taken up the two bills and had advanced 40*l.* for a new bill of 300*l.* at two months' date, so that poor Greenhorn had paid exactly 100*l.* for 200*l.* for six months, being at the rate of cent. per cent.

It was the beginning of the long vacation when my unhappy client came to me with the writ, and I promised him a respite till the 24th of October, by appearing for him to the action, which would stop proceedings till term. Greenhorn's delight at this respite was refreshing to witness. From the slough of despond he rose to the seventh heaven of boisterous spirits. "Would I dine with him at Greenwich? No? At Richmond? No? Well, then, he *would* dine with me. He would have a lark, by Jove: he would chaff Mordecai till he was as mad as a hatter: he would paint the Jew's door a different colour every night: he would pay up on the 24th—no, on the 23rd, by Jove, and sell them all."

I took Greenhorn to the Cock. The worthy William (whom Tennyson has immortalised), the best of waiters, got us the finest steak and the best bottle of port which the Cock could produce. We showed Greenhorn "the farthing,"* and told him about Pepys and Mrs. Knipp coming there to supper. It was all new to him.

"What a jolly old fireplace!—what splendid port! He would bring Slasher of ours, and Crasher of the Light Bobs to dinner there."

Over a quiet pipe that evening (of course poor Greenhorn smoked cigars at about three guineas a pound), I took for my text William at the Cock, and preached a long sermon on the comfortable independence which that honest waiter made by the pennies of the customers, and I grew somewhat eloquent on the theme of cheap pleasures. I explained to Greenhorn that the dinner which we had eaten and wine which we had drunk at a cost of a few shillings, could not be surpassed in quality at any hotel where we should have paid a guinea. I went further than this, and conspired with Jones, Brown, and Robinson, to join us at a pool of billiards, when we hired a private room, and played our usual stake of sixpenny pool and twopence a ball, so that the losers could only lose a shilling a game. Greenhorn was obliged to admit that the pleasure was as great as if the stakes had been half guinea pool and a crown a ball.

I never saw him after that night. It was clear that the effect of my preaching on economy had taken no root, for his last words were a pressing invitation to Jones, Brown, and Robinson—"three capital fellows, by Jove!"—to come and stay for a week—the garrison races were coming off, and there would be a drag every day and a champagne lunch.

Every man has his fate before him, and poor Greenhorn's turn came. He did *not* chaff Mordecai till he was as mad as a hatter, *nor* did he paint the Jew's door, *nor* did he pay up and "sell them all, by Jove!" for the next communication which I received from Greenhorn was early in the month of November, and the letter was dated "*County Jail.*"

The poor captain was repentant again, "he would never touch another bill, he would exchange and go back to India; he felt a changed man already. Would I write to the governor for him?"

Of course I did as my client wished, but before I could get an answer from "*the governor*"—who had paid Greenhorn's debts three times before—I received another letter from Greenhorn, written in the highest spirits. "A regular trump," he wrote; "Israel Solomon, a *very respectable fellow*, had paid debt and costs, and he was free again."

Speaking from memory, I think that I am within the mark when I say that Mr. Israel Solomon's little bill was somewhere about the rate of 400 per cent. It was managed on this wise: Israel Solomon paid *half* Mordecai's claim, and poor Greenhorn gave fresh bills for the balance to Mordecai, and bills for the whole amount of debt and costs to Israel Solomon. Matters were now really serious; Greenhorn's father came forward at once on my representation of the desperate state of affairs. I had not the winding up of the Jews; Mr. Fogey, the family solicitor, had the conduct of the business; and I believe, to the day of his death, old Greenhorn thought that I had a hand in leading his son into extravagance, although my books show, to this day, that I never saw the colour of Greenhorn's money for any professional services even, for I loved the youngster "for auld lang syne," and tried to keep his boat upright. At my instigation, however, threats of conspiring to defraud were made against Israel Solomon, Mordecai, and Jacob Shylock, the legal adviser of those gentlemen, who was somewhat anxious that the Law Institution should not be *too* curious about the arrangements which he had made in settling the price of Esau's potage. The upshot of the matter was, that the claims of the gang were

* One of the old copper tokens which were issued by the landlord of the "Cock ale-house" before the Fire of London.

equitably adjusted, and they received no more than the money which was actually advanced, and some twenty or thirty pounds amongst them. Greenhorn left England clear of debts, and died on foreign service.

Now, with the exception of a trifling variation of names and places, the above is an honest description of one of many cases which have come under the immediate notice of the writer hereof, and is "on all fours"—as the legal phrase runs—with hundreds of cases which are daily, nay, hourly occurring. The victims of the bill-discounters are by no means the worst of their species. Many a cautious hypocrite manages to keep clear of debt himself, and flatters poor Prodigal, and drinks his champagne, and wins his money, and still contrives to keep up an outward appearance of respectability, taking good care to forsake him as soon as he is safe within the walls of the Queen's Bench.

How the fashionable world would stare if an omniscient fairy were to enter any public assembly, either at church, opera, ball, concert, or even the houses of the legislature, and tap with her wand every man who had dealings with Mr. Lasher, or—worse still—with the Mordecais or Israel Solomons. The names of the victims is Legion. The Lasher school fear nothing but exposure, but their dealings being only with men who are reasonably solvent, they seldom come before the public. The smaller fry of usurers relieve the large houses of their clients as soon as they have been tightly squeezed, and this latter class do not care for exposure. They do not mind appearing before the Insolvent Court, and stating, with some degree of negative honesty, that they lend their money at a great risk, and play for an enormous stake.

Under the present state of things the bill discounting attorneys and professional usurers can afford to ride their blood-horses and give champagne dinners, even if one debt in three turns out bad; but if interest was kept at a maximum of twenty per cent., there must not be more than one bad debt in seven to enable the money lenders to make their profit.

The Sowerbys, and Bloundel Bloundels, and Demeaces, are irreclaimable scoundrels, and these pages are not meant for them; but if this number of Once a Week should fall in the way of any young fellow who is in the hands of the Jews, let him go at once to Paterfamilias, and make a clean breast of his troubles. As Foker remarked in Pendennis: "The governor will blow like a grampus, but he will get his wind again." And I honestly hope that "the governor" will have the moral courage to tender the exact amount of debt and five per cent. interest to Lasher, Mordecai, or Israel Solomon, as the case may be; and in case of refusal fearlessly confide his sorrows to the tender mercies of a British Jury. F. G.

AMONG THE DEATHS.

I.

"Of fever, in Africa, Richard Brand."
The words start clear thro' the twilight gloom:
The paper drops from her shrinking hand,
And the presence of death fills all the room.

II.

A noble room, where the firelight falls,—
At fitful intervals falls and fades,—
On curtains of silk, on gilded walls,
On gleaming marble, crimson brocades.

III.

She waits alone for her husband's guest,
Lord Arthur,—he has dined with them often of late.
She waits, in jewels and velvet drest,
As befits her beauty and her estate.

IV.

On her arms and bosom, profusely bare,
Shine the diamonds she bought on her marriage-day.
One red rose rests in the golden hair
With which Richard's fingers have used to play.

V.

Dead—Richard dead! and she is alone,
In her silk and velvet and jewels here.
O, soft white breast, make never a moan!
O, soft brown eyes, shed never a tear!

VI.

The time for moan or tear is over:
Nor tear nor moan can bring death to life.
What woman need weep for a dead poor lover
Who has honour and station,—a rich man's wife?

VII.

Honour and station! and Richard dead,
On the fevered shore of that distant land.
No faithful face at his dying bed;
No tender lips on his dying hand.

VIII.

And she loved him—she loved him! The poor false heart
For a moment bursts out with one honest cry.
For a moment the actress forsakes her part:
The woman returns to the love gone by.

IX.

And with him once more, in the purple light
Of the summer evening, she takes her place;
Where the starlit heaven o'er the moor shines white,
And all her heaven is on Richard's face.

X.

His arm is round her; she feels his kiss;
And her trembling breath comes thick and low
With the familiar foolish bliss,
The freshness, the passion of long ago.

XI.

What has she now? Her husband's name;
Settlements; diamonds; five hundred friends
To come to her parties; her beauty's fame;
Lord Arthur's homage. And so it ends.

XII.

No; something more. Far away, up-stairs,
Are her children. She sees them every day,
I believe;—but with so many vital cares
Of dances and dinners, what are they?

XIII.

Perhaps, in a different station, other
And humbler duties had lain to her hand.
She might have had leisure to be a mother
If she had married Richard Brand.

XIV.

But all that is over. Years ago
She sold herself freely—body and soul—
For the things that she holds in possession now;
And the sale was a wise one,—on the whole.

XV.

When Richard last held her to his breast
 Her lips were stainless, her heart was true;
And now—and now—well, let that rest.
 Richard is dead: let the past die too!

XVI.

Let the past die. The present is all.
 Lord Arthur's step is upon the stair.
After dinner the opera and the ball;
 This folly will surely not haunt her there.

XVII.

With a strange wild beauty her cheek is red;
 With a strange wild lustre her eyes are bright;
But still the silent face of the dead
 Looks full in her face that weary night.

XVIII.

And still, amidst music and whispered sighs,
 Thro' her soul goes a shuddering under-breath,—
"Better be Richard Brand where he lies
 Than sunk in the slough of a living death!"

THE AUTHOR OF "MORALS OF MAY-FAIR."

THE LITERATURE OF THE SHOP.

A COUNTRY RECTOR'S COMMENTARY.

It was just three months since; indeed, to speak with preciseness, it was Saturday, the 4th of May. Sophonisba, who is at once the joy and better half of my existence, was breakfasting with me in the dining-room of my pleasant country rectory. Within the room everything (including our two selves), looked agreeable, bright, and warm; out of doors it was cold and cheerless, and anything but agreeable. Although the almanacks assured us that we had entered upon the genial month of May, yet, the east wind was howling, biting, and cutting, and was altogether behaving itself with a rude severity that no panegyric of Mr. Kingsley could mitigate, while a driving hail-storm rattled against the window-panes with a sound like the dropping fire at a Volunteer Review.

"Sophonisba!" I exclaimed to the joy of my existence, as I turned from the kippered salmon to the devilled kidneys (my tastes are proverbially simple), "Sophonisba, it is well that we have not sacrificed our winter garments upon the altar of our fickle climate, but have relied upon the truth of our village adage, 'Till May be out, Ne'er change a clout.' If my singing Curate, Motet, were with us, we could perform that pretty old glee, 'Hail, all hail, thou merry month of May!' it would be appropriate."

"Think of the blossoms, my dear Alphonso!" was the response, as a fresh *feu de joie* of hail rattled against the window. "The wall-fruit is gone; and, now, the apples will be caught."

Between mouthfulls, I was cutting the leaves of that morning's "Saturday Review," and was dipping into their article on "Negroes, and Negro Slavery;" so, instead of vouchsafing any other intelligent reply than a grunt, I shortly called Sophonisba's attention to the Review. It so happened that, during the previous fortnight, the greater portions of my evenings had been occupied by new books by Consuls Petherick and Hutchinson, on Ethiopia and the Soudan, and by Reid's "Sketches in North America;" and these works, and the present crisis in America, had made me more than ordinarily impressible on the subject of the slave-trade. I presume that it arose from this combination of circumstances, that I suddenly uttered the Archimedean cry of *Eureka!* when, after laying aside the "Saturday Review," I had turned to glance over the various printed and lithographed communications that formed a part of the contents of that morning's letter-bag.

Now, parsons are peculiarly liable to other visitations than those of an archidiaconal character, and they are notably exposed to the literary attacks of puffing tradesmen. The chief assailants (apart from clerical subjects, appeals from Church Defence Associations, and Insurance Companies), are hatters, grocers, tailors, and wine merchants. They are particularly attentive to me; and, unlike the generality of my brethren, I always glance over their epistolary commendations of their own wares—not with the thought of giving any order to these mercantile anglers (for I never once have risen to their most alluring flies), but solely for the enjoyment that I derived from a perusal of their literary efforts. For, it appears to me, that the literature of the shop is an astonishing evidence of the progress of education, and a distinguishing characteristic of the Victorian era. To me the development of this peculiar branch of literature seems to be a feature of the age—an useful one, probably, and remunerative, or our nation of shopkeepers would not bestow so much care or money upon it. They are no longer content to call a spade, a spade. They send it forth in mountebank disguise, with a nomenclature which is neither English, French, Greek, nor Latin, but perhaps, a base mixture of all four; and, through the aid of literature, this wonderful article is recommended to notice, and puffed into a pseudo fame, by the most ingenious artifices.

De tea fabula narratur.—I might tell you a tale of a tea-merchant in our county-town, or I might cite the cases of the butcher and the two rival tailors, who, every week, in the pages of our "Slowshire Independent," puff their respective goods through the medium of mortal verse. I am not ashamed to confess that if I do not use or consume their wares, I devour the verses. To my mind, their lyrics form one of the chief attractions of the "Independent," whose articles, it must be confessed, are not equal in ability to those in the "Saturday Review," and it is often a subject of curious speculation to me—Who writes their verses? There was the butcher's poem, last week, on the subject of Garibaldi: I vow that it had all the fire and grace of Tupper! the delightfully easy way in which it turned from Italy and Garibaldi to "Giblett's juicy chops," and the delicate yet forcible manner in which it pointed out that Giblett was no less a patriot than Garibaldi in his endeavours to serve his countrymen, was, to my mind, not unworthy of our great Proverbial Philosopher. While, in the same newspaper, there was another poem on the subject of the British Volunteers marching to glory in Aaron's guinea pants, which Miss Euphemia Gushington might have owned.

"Yes, Sophonisba!" I cried; "I never throw these advertising circulars into the waste-paper basket without having first extracted the honey of their style, and made myself master of their

eloquent rhetoric. Here is another circular from the Great East Indian Brandisherri Wine Company, enclosing quite a pretty pamphlet on the wine trade and prospects of the vintage, and a confidential (lithographed) letter, stating their possession, under very peculiar circumstances, of a pipe of a fine fruity port, which they have not thrown into their general stock, but which they have thoughtfully reserved for their own immediate friends, who will be privileged to purchase it for a mere bagatelle. Now, I wonder what the bagatelle may be when translated into the simple letters £ *s. d.*; and also, whether or no, they include me among their immediate friends; and, if so, why? But, here, Sophonisba, is the circular over which I cried an Eureka; for it cuts the Gordian knot—it provides us with a solution of the Sphinx's enigma—it gives us the recipe for throwing the old man of the sea from off our shoulders; in short, it tells us how to put an end to the slave trade. So you see, Sophonisba, that, despite your occasional surprise at what you deem my waste of time in glancing over these trade puffs—which are meant to swell into a trade wind to blow custom to the advertiser—yet that I am able to pick up nuggets of knowledge in these literary diggings. In harmonious and elegant prose, the circular thus commences: it is from the Cosmopolitan Composite and Translucent Candle Company: 'It is but seldom that any really great improvement in manufactures is achieved. To speak comparatively, it was but yesterday, when cotton dipped in tallow formed the chief candle for general use. But, at this day, products imported from tropical climates, aided by Science, give forth crystallised material from which the beautiful candles now offered are obtained.' Then follow statistics, treated with Gladstonian skill, and remarks on the palm-oil trade, and then comes my Eureka. 'The development of this branch of their manufactures will promote *the extinction of the slave trade.*' A sufficient reason, of course, why all these Britons who never will be slaves, should patronise the Cosmopolitan Candle Company. By the way, what a useful fact this would be for an Exeter Hall orator, for I suppose the May Meetings extend their sympathies to the Man and the Brother. I remember hearing a speech on the subject, and very proper sentiments being expressed, and I certainly thought with the speaker, that we had no longer a right to expect a continuance of those blessings which we have so long enjoyed, if we in the slightest degree encouraged that unhallowed and cruel traffic in man, against which England, for more than fifty years, has been working by the efforts of her greatest statesmen, and her best and bravest sailors. Aye, Sophonisba, but there's the rub. Look at these circulars, and all the varied literature of the shop, and see how eloquently and ingeniously they commend commodities, our very use of which arises from and assists the development of the slave trade. This puff from the candle company is, in shop-language, a startling novelty. Supposing their statement to be correct, they need not fear that it will be basely plagiarised in this circular of Carraways, the tea-dealers. If we do not wish to encourage, in the slightest degree that unhallowed and cruel traffic in man, we must make up our minds to deprive ourselves of a tithe (to speak rectorially) of those articles of necessity on which the literature of the shop so eloquently descants. You, Sophonisba, will have to reply to Mr. Carraway when he addresses you on the subject of sugar, that you are determined not to lend any support to the slave trade; and I must bear the same testimony when he speaks to me of coffee. Mr. Carraway would probably think us mere Bedlamites. But we might reply to fifty other tradesmen in similar terms, and yet be in our right minds. For use has dulled our senses to facts, and if our comforts and appetites are ministered to, we are content to shut our eyes to the means employed. Take the case of Jones (let us say), who, on the subject of the slave trade, is a very Wilberforce. Well, then, Jones sips his slave-grown chocolate, sweetened with slave grown sugar, wipes his mouth with a cotton pocket-handkerchief, and, rising from his bamboo chair, playfully rubs the head of Mrs. Jones's Jamaica parrot. Jones then gets into his gig with its lance-wood shafts, and drives to a meeting of the Anglo-Mexican Mining Company, where he pays up his instalments, and from thence goes to the sale of American produce, where he makes purchases of Carolina rice. He accompanies one of the directors to the City of London Tavern, where he finds an excellent dinner set out upon a table of mahogany. He eats his turtle with a silver spoon, drinks iced punch flavoured with sugar and rum, sprinkles his turbot with cayenne pepper, bedews his cucumber with Chili vinegar, and winds up with curry and hot pickles, preserved ginger, a glass of noyeau, and a cup of coffee. He then puts down ten pieces of gold as a contribution to the Society for the Suppression of the Slave Trade—whose eloquent circular has brought the literature of the shop home to his very heart; and then goes back to Mrs. Jones with the honest conviction that he would sooner cut off his right hand than do anything that would in the remotest degree encourage that pernicious traffic in human souls. I wonder if Jones has received one of those circulars from the candle company! I have quite done now, Sophonisba; and am going into the study to write my sermon."

"My dear Alphonso," said the joy of my existence, "I think you have been preaching one to me." CUTHBERT BEDE.

THE GHOST THAT MY GRANDMOTHER SAW.

One lovely summer's evening I was sitting with my grandmother on the terrace of one of those beautiful villas situated on the "riviera di Genova," overlooking the blue Mediterranean. I had been reading Longfellow to her, for although an Italian she was well acquainted with English; she bade me read once more the "Footsteps of Angels," and it was after these lines—

Then the forms of the departed
Enter at the open door;
The beloved, the true-hearted,
Come to visit me once more,

that I asked her—half in play, half in earnest—whether she had ever seen a ghost?

"Altro! figlia mia," answered she with a sigh, "but it's a story more than fifty years' old, and I would rather you did not ask me to tell it you."

She seemed very reluctant to make me acquainted with it, but my curiosity being now fairly roused, I grew importunate with my entreaties; it was some time, however, before I could prevail upon her to satisfy my curiosity, and when she did so, her tale was so mixed up with matters, wholly uninteresting to the general reader, that I prefer giving it in my own words:

My grandmother was the daughter of the Count di L——; at sixteen the young Maddalena was counted among the fairest maidens of "Genova la superba;" her hand was sought by numberless youths amongst the nobility of Italy, but my grandmother, like many other damsels both of ancient and modern times, had a preference; she had met at church the young and handsome Count F——, and she had vowed in her little heart that she would marry none other. Letters were exchanged between the lovers, and each evening, when the clock of the church of San Lorenzo struck nine, the young Count might have been seen pacing up and down under the balcony of his youthful mistress. The Count di L—— was averse to the match; he did not deem the young noble worthy of his treasure. "She must," he had said, "be the bride of a prince;" but Maddalena had an uncle, the Cardinal M——, whom she dearly loved, and he was all-powerful with her father; to him she intended to impart her little secret—she had long waited for his return from Rome, whither the benevolent prelate had gone, to be present at a "Concistorio."

One morning she received a long letter from him, informing her of his approaching arrival; and on the evening of the same day the family were sitting at supper, for in those days the evening meal had not yet taken the name of "dinner." They were all joyful in the expectation of the arrival of the kind-hearted Cardinal, and Maddalena especially so, when they were startled by the sudden entrance of an acquaintance, whose countenance showed he was the bearer of ill news. "Had they heard," he asked, "what had happened?"—All answering in the negative, he replied that the young Count F—— had been murdered an hour ago; the assassin had fled; more no one knew.

My grandmother tells me she heard the news without a single cry or groan; she bore it all. Sick at heart she rose from the table, crossed the room to the door almost unnoticed, for all were eagerly discussing the fatal event; she even curtsied to the one guest who opened the door for her, but how she reached her room she cannot tell, —she remembered locking the door after her, and kneeling by her bedside, where she relieved her breaking heart by a flood of passionate tears. She was in that state of faintness which comes with exhaustion from extreme weeping, when the bell of San Lorenzo began the first peal of nine—a terrible sensation came over her, and yet she could scarcely realise the truth; could it be that that voice she was in the habit of hearing every evening, at that very hour, call her by name, had been stilled for ever!—that he whom she had seen only the evening before, full of life and hope, was now lying dead,—killed by the hand of an assassin. Slowly the church clock finished striking the hour, and the silence which it left behind brought an indescribable pain to the heart of poor Maddalena; she was too weak to pray, but slowly raised her weary eyes to the image of the "Madonna," placed in the alcove opposite to where she knelt; when, suddenly, she heard a voice calling her, "Manin," the same voice which called her every evening at that same hour. Oh! the idea was maddening! She rose, parted with both her hands the hair from her fevered brow, and listened, her heart beating and her feet nailed to the floor; her limbs stiff with horror. She listened, and again the voice called "Manin!" and a third time again, "Manin!" but she did not stir; she sat on her bed, listening for the sound of that voice, but in vain she waited, for the voice was not heard again that night.

Her nurse came soon after to the door, and the noise she made in her efforts to gain admittance roused my grandmother, who ran to the door and let her good foster-mother in. The old woman had heard of the sad event, and was full of sympathy for her young mistress, who, she saw at a glance, was nearly prostrate with sorrow. She entered into the particulars of the assassination of the young Count with all the garrulity of her kind, saying that never had fairer "cavaliere" fallen victim to jealousy, for, added she, it must have been the cause of so foul a crime—some one who loves you too well has ordered this deed.

Maddalena concealed from every one the knowledge of the voice she had heard. The following day passed slowly, and with impatience did she await the hour of nine, when she thought she would hear that voice which at least reminded her of the dear friend she had lost: it was a link, though a slight one, thought she, between her and the unseen world whither he had gone. Was it really his voice she had heard, or that of some one cruel enough to desire to keep up the delusion? She would judge with her own eyes. Again did she hear the clock on the following evening strike the hour of nine; but again the sound of that voice, which she heard once more call her by name, troubled her as it had done the evening before, so that she did not dare to go to the window: a cold shudder came over her,—she felt as if about to die.

"But, cara nonna," said I to her, "why did you not go to the window and see who called?"

"Figlia mia," she replied, pressing my hands in hers, "non mi sentivo corraggio. For seven days following I heard that same voice, and I began to fear that I should be haunted all my life with the sound of that voice. I prayed fervently for strength, and on the seventh day I determined to judge by myself if indeed it were an apparition. I shall never, as long as I live, forget that evening. When the clock had completed the last stroke of nine, I heard, as I had done on the preceding days, myself called by name, 'Manin!' I took my rosary, and with a beating heart walked to the window. I looked down and saw *him*—the young Count F——, who had been assassinated seven days before, under my window. He raised his face to me, and

though deadly white, I recognised him in an instant. I was afterwards told that I uttered a loud shriek, and was found stretched senseless on the floor of my balcony. I recollect nothing further of what passed until I found myself on my bed in my darkened room, with anxious faces around me, my hand resting in that of my beloved uncle. I saw on my uncle's face how ill I had been. It was some days before I was allowed to ask any questions. I then learned that I had been long and dangerously ill. I recollected all about Count F——'s assassination; but when I told my uncle that I had seen him, he smiled, and gently told me it was the effect of fever—nothing more."

"Was it so, do you think, grandmamma?" asked I.

"My daughter, were I to die this moment," she answered, with energy, "I would swear that I saw the ghost of Count F——."

I knew that my grandmother's marriage had not been a happy one. I asked her if she had ever discovered the name of the perpetrator of this crime. She grew very pale, and, stooping down, left a cold kiss on my forehead, saying,

"I did, soon after your father's birth; but *never ask me to tell it you!*" Bianca Bertoni.

SKETCHES FROM MY ITALIAN HOUSEHOLD.

THE LADY'S-MAID.

When one thinks of the pompous damsels who in England claim the title of Lady's-Maid, or of the coquettish and pert French aspirant to that situation, an Italian "cameriera" is almost unworthy of such a distinction. In the first place, she is not above making herself generally useful; she does not consider it violates the dignity of her calling to "fare il servizis," that is, to sweep and clean her lady's bedroom, as well as to adorn her lady's person. Secondly, she can not only dress hair, make dresses, and trim bonnets and caps, but she washes and irons, and sews; she can embroider, and plait straw, and she can, on an emergency, even repair her master's trousers and make his waistcoats. In the last place, and this is what most absolutely degrades her from such a dignity, she is content with the most moderate wages. For five, four, nay three, dollars a month she will undertake all these arduous duties.

In her ordinary dress she is, I will confess, as a general rule, far less elegant than her sister abigails of France and England; but when, on an occasion of any very solemn "outing," she does dress herself in her best, she excels them, in as much as she wears her clothes in a far more aristocratic manner, and her speech, gestures, and bearing are far more lady-like. The extreme courtesy and good-humour, which is as a vein of fine ore in the Tuscan character, is universal. The Teresinas, and Virginias, and Gelorgias have it no less than the owners of the grand historic names. A Tuscan is rarely violent or ill-tempered. The women are perhaps more so than the men; but it is not usual in either sex. I have heard many foreigners speak of them as dishonest, and there may be a set of servants who devote themselves exclusively to the service of passers-by who are so; but, judging from my own experience, they are quite the contrary.

There is a certain feudality of feeling, if I may so speak, among Tuscan servants. They identify themselves with a family, and like to remain in its service. It is a common custom among Italians to remember their servants in their wills, and it is an ambition which the true unsophisticated Tuscan servant always acknowledges, to remain many years with the same master. It is curious to hear how, after a man or woman has been a certain time in a situation, he or she always speaks in the first person plural as regards all the belongings of the family. It is always "we," and "ours," and "us." There is much more familiarity than with us between masters and servants, and no other nation has retained so inveterate a republican equality in all these respects as the Italians. Social freedom and political bondage have been the two sides of the shield here, as the reverse is seen in England and America. My maid Virginia, for instance, going out to enjoy herself at the Carnival, does not hesitate to ask me to lend her any trifling ornament or finish which her dress may require. I confess I like this confidence in one's good nature, this reliance on a bond of common humanity. The "thou" with which servants are invariably addressed has also an affectionateness in its sound (exclusively appropriated as it is to them and to the dearest and closest family ties), which insensibly softens and modifies our intercourse with them.

An Italian lady's-maid has a great love of out-door amusements. She must always have her Sunday "passeggiata." The "feste" (saints' days) must not be interfered with. She will walk all day long at such times to see the dresses and carriages in the Cascine, or along the Lung 'Arno, and to be seen. Then there is the Carnival. She stipulates, on engaging with a new mistress, that she may go once to the theatre, and once to the "neglione" (the masked ball at a theatre is so called), and to the Corso. The Corso is the drive along certain streets, on fixed days, of all the nobility, gentry, and commonalty of Florence, in their finest equipages, dresses, and liveries. Some of the carriages are full of flowers, some of bon-bons, some carriages are full of masks, in some there are strange, and grotesque costumes. The carriages go at a foot-pace, the pedestrians throng the streets, and every balcony and window is lined with people. How strange it would seem to us if a sober English lady's-maid knocked at the door of the sitting-room, and asked leave to show herself, previously to going to a masked ball, as my maid has just done.

"Come in, Virginia."

And enter Virginia, a tall fair girl, with her bright hair raised from her forehead over a cushion, and then plaited and adorned with pearls and flowers in true rococo style, a tiny coquettish Swiss straw hat is perched on one side of her head; she wears a black velvet laced boddice, trimmed with red ribbons and pearl buttons; beneath the boddice is a white full muslin chemisette up to the throat, showing the fair proportions of a well-made bust, a white muslin shirt, trimmed with black and red, very full, and rather short (be

it said), completes her dress, and her little black velvet mask is in her hand. Her face glows with delight. There is not the slightest levity about her, she is simply as happy as any girl can be. From the last Carnival to this she has thought of her dress, and every little scrap of ribbon or bit of lace that she could get together have been laid aside for this occasion. With the dimples on her smiling face, and her bright eyes, she is as pretty a sight as one can see, and I am quite sure she will not want partners. She is going with her sisters, her brother-in-law, her aunt, her cousins, a party of eight or ten, and—crowning felicity of all—a fiacre is to be sent for her and to bring her home. To-morrow she will present herself at the usual time, and go through her duties as quietly as before. Her dress is put by till next Carnival comes, and it is all over.

Her Sundays and saints' days' "passeggiate" are all the pleasures she will now need. To these may be added the fairs. On every Sunday during Lent there is a fair at one of the gates of Florence, at which are sold a little flat thin cake, something like the Swiss "gauffre," called brigidini, and nuts. The brigidini are of very ancient date: the flat kind of tongs in which they are baked have been found in old curiosity shops, dated 1100. They are flavoured with lemon, and crisp, like wafers. These fairs are called by the quaintest names. There is La fiera degli innamorati, La fiera dei disperati, La fiera delle spie, &c., &c., according to the gate at which they are held.* There is also the fair of the Santissima Annunziata, held in March, where everything is sold, from a bedstead to a doll. These fairs temper the monotony of the rest of the calendar year.

Novel-reading, tea-drinking and shopping are pleasures not understood by Tuscan maids. Their reading is of the most limited kind, tea-drinking is an abomination to them, and their shopping is very desultory and undignified. They frequent fairs, and actually patronise sellers of second-hand goods. They do not like to go shopping even for their mistresses. Walking out alone they always avoid; and it appears to them an uncalled for and cruel necessity to wear out their shoes, bonnets, and clothes on "giorni di lavoro."

On the other hand, they do not scorn and abhor any economical habit which their mistresses may think it worth while to practise. There is none of that vain glory in wastefulness which is so common in English servants. There is a greater value for money in some respects, and yet a less regard for it, than in England. So much can be enjoyed without money in Italy, so little in England, that the stand-point is different in the two countries.

An Italian lady's-maid likes to marry a man servant in the family she serves. "Husband and wife in one service" is one of their dreams of well-being; and as it is the custom for women of all classes never to nurse their own children, the married state does not interfere with their duties. When the time comes for the child to leave its nurse, some odd corner in the house is generally found for it, where it remains "suffered" rather than "permitted" till the time comes for it to be, if a boy, apprenticed to some trade or sent to some school; if a girl, to be taught knitting, working, ironing, &c. In this primitive and patriarchal fashion, which, however, I am sorry to say, is almost passing away, the household of an Italian family is more linked together by personal affection than in our more limited and regular establishments.

That expressive phrase "keeping company" is understood in Italy quite as well as in England. Every girl has her "damo," whom she hopes at some indefinite time in the future to marry. But I am afraid it is the institution rather than the individual that is valued. There is often a change in the principal actor, though the drama goes on.

Tuscan Lady's-Maid, dressed for a Ball.

"En tout bien et tout honneur," be it understood. Single girls in Italy are taken care of and bear a good reputation. Now and then a catastrophe takes place, but owing to what the rigid world would call a laxity of morals, the consequences do not involve the entire ruin of the guilty one. All is not hopelessly forfeited. She need not sink lower in utter desperation. It still depends on herself to maintain her footing, and in time and with opportunity to regain respectability. I think, therefore, in the mode of dealing with this offence, the advantage is on the side of the Italians.

A favourite amusement of the Italian lady's-maid is that old-fashioned Jezebel one, looking out of window. When by some mishap, or miscalculation, the new bonnet or dress has not been ready in time for going out, you will see them leaning out of the window, with a "scaldino" in

* Porta San Gallo; Fiera dei Curiosi; Fiera dei Furiosi: Fiera degli Innamorati; Porta al Prato; Fiera dei Disperati; Porta Romana; Fiera dei Contralti; Porta San Frediano; Fiera delle Spie.

their hands if it be winter, or the everlasting fan if it be summer, for a whole afternoon. What pretty faces one thus sees as one looks upwards, in some of the dark narrow streets, watching hour after hour, with steady unmoved gaze, the passing crowds. Faces which bear the same lines and are of the same type as the features we have so admired in the churches and galleries. Masaccio has painted them, and Lippo Lippi and they have been idealised by Perrugino. Faces which have a sudden flashing out into smiles which is peculiarly Italian, and which, seen framed by the dark old arched windows, with their twisted columns in the centre and mediæval copings, are a picture in themselves.

I have spoken of the Tuscan lady's-maid. She, however, is a person of grander and larger and more barbaresque mould. She has a kind of indolent and stolid fierceness about her. Her steady wide-open eyes have far less sparkle and intelligence in them, and she is certainly not so clever or efficient as her Tuscan sister, but she is affectionate and faithful. In cases of illness, she will sit rocking herself on the ground telling her beads by the side of the patient night after night, without a murmur or complaint. Then it is more than worth her salary to hear her speak with the musical full enunciation she gives to her words, and to watch the way she holds that noble head of hers, with its loops of black tresses, fastened by the silver, crescent-shaped comb.

There is the Lucchese, of fairer complexion and slimmer figure, handy, clever, industrious, but, as a general rule, less to be relied on; the Pistorian, with "a wild-fruit flavour," and a savage kind of grace about her, and the Neapolitan, full of tricks and cleverness, and humour and plausibilities; but all are easily contented, more obedient, and more obliging than an English servant, and more faithful and less selfish than a French one. The experience of some years has brought me to this conclusion, that no servant is more generally useful and more pleasant to have in one's house than a good Italian cameriera. Let me add that this word cameriera means both more and less, than its literal translation, lady's-maid.

THE COOK AND MAN-SERVANT.

As a companion to the Italian lady's-maid, I must describe the Italian man-servant. This personage is at once housemaid, cook, purveyor, footman, butler, and waiter. In the morning he sweeps and cleans the drawing-rooms and dining-rooms, and prepares the breakfast; he then goes to market and buys the day's provisions. This is done deliberately, and gives opportunity for an unlimited quantity of gossip with other servants occupied in the same manner, and a diversion into a café to look at the "Nazione," and indulge in a little rest and a cup of black coffee. Then it is time to return home. A white apron and white cap are put on, and the real business of the day commences. The charcoal fires are lighted and the preparations made.

At intervals the cloth is laid, and then, when all is ready, and with an occasional help from the woman, the dinner is served.

An Italian servant usually keeps in his own private employment some retainer who does the dirty work, draws the water, washes up the dishes, and cleans the kitchen. This supernumerary is usually nameless, or bears a nickname. The one who is "attachè" to my servant is called "Vecchio." He is certainly an elderly individual, but does not deserve by any means, either from age or appearance, so disagreeable an appellation as "the old one."

After the dinner is cleared away comes a season of repose, spent over a cigar or pipe by some, in a siesta by others, until the hour of the afternoon drive. By that time the man is dressed, and ready to attend as footman; if the dinner is late and the carriage not used, the eternal café with its dominoes and cards and gossip is again resorted to. A man receives five or six dollars a month. I am always speaking of servants paid according to the rate that Italians pay their domestics. There are servants, and those by no means the best, who are engaged by English, or Russian, or American families, who receive treble that amount of wages, but the sum I have mentioned is the Italian average salary. The usual manner of house-keeping is for your servant to buy, day by day, the articles wanted for daily use, and you pay him every day or once a week. That array of tradesmen's books, with those wonderful hieroglyphics with which the butchers like to puzzle and aggravate you, and the baker and greengrocer vie with each other in confusing you, are all but unknown. One sum in addition serves for all.

Some persons adopt a method of limiting their expenses and simplifying still more their household arrangements, which is to agree that their cooks should provide for the expenses of the family at a certain sum per diem, which is to include everything but tea, wine, or any extraordinary and unusual demand. This is termed "a cottino." It requires, of course, a knowledge of the price of every article to judge whether justice is done in the quantity and quality of the food provided, and it also requires an exercise of imagination on the part of the cook to vary the "ordinary" of each day. To my thinking, it is not a satisfactory method for either party.

In Italy, the luxuries of life are cheaper in proportion than the necessaries. The difference in the weights and measures approximates the expenses of living in England and in Italy more than could be at first sight imagined. A hundred a-year can go as far in England as in Italy, but every additional hundred is worth half as much again, and after five hundred, worth twice as much again.

The character of an Italian man-servant is usually pacific and indolent. This last quality seems strange, considering the multiplicity of occupation which he gladly undertakes, but is the fact. In variety of work is repose, so philosophers tell us; and the manner in which an apartment is arranged, the absence of much, or sometimes of any, running up and down stairs, the little dust or dirt which can accumulate on those painted floors, and the facility with which wood fires are kept up, combine to spare the strength of one's domestics. An Italian has also great personal independence. He will not sacrifice his beard or moustache on

any consideration, he would forego the best situation rather than shave. On the subject of honesty there have been dreadful complaints, but I think they have been exaggerated. I do not deny that with some Italians there is a Spartan characteristic of liking to prove their ingenuity in overreaching, not only their employers, but the tradesmen with whom they deal. They use a persistence and an eloquence in beating down the price of an article, worthy of a better cause, and if they succeed in doing so they pocket the advantage without scruple. This is not honest, certainly, according to our notions. I must add, however, that this advantage would never be conceded to the master in any case whatever, so that he is not a loser by sending his servant to make purchases instead of himself, he only loses the difference which is made in selling to an Italian instead of a "forestiere," and which is considered the rightful perquisite of all the negotiation and diplomacy which has been employed. Yet I would trust money, trinkets, plate, as willingly to an Italian servant as to an English one. By showing the first he possesses your confidence you almost invariably secure his fidelity. The fact is, a good servant soon feels a kind of personal affection for the property of his masters, and respects it as he would his own. It is only, I repeat, when he succeeds in driving a sharp bargain that he cannot resist the temptation of profiting by it. Does no pilfering go on with us?

The weakest part of an Italian's character is his love of making excuses. Lies are, I fear, cosmopolite; but for the inventive faculty of dressing up a falsehood with all kinds of imaginary circumstances, I think the Italians are supreme. It is often as much for the sake of pleasing "per contentarta," as for the sake of deceiving. I must explain, however, that they jump to conclusions with a rapidity and an unreasonableness, which often bears the appearance of wilful falsehood when it is not so. Their mobile natures and vivid imaginations are to blame for this. Then their perceptions are so quick, that a look or a gesture betrays to them in what direction your inclination tends when you ask them a question, and their wonderful easiness and pliancy of temper enables them to adapt themselves in their answers to it. I must also say that there is something so childlike and simple combined with all their facility of contrivance and plotting, that their intrigues are usually very transparent. "Siamo furbi," they say with great self-gratulation, for they prize nothing more than this reputation. Dissimulation rather than simulation is their forte. It has been so long the necessity of the oppressed against the oppressor. Fine wit has so often resisted the brutal force opposed to it, that they have acquired a faith in stratagem which it will take years of freedom to uproot.

One thing has always struck me, the indomitable and deep-seated consciousness of their own superiority, as a race, which this people have always cherished. With their necks under the Austrian heel, it existed undiminished. The Austrians were feared and hated, but even more despised.

There is little or no flunkeyism in Italian servants. They do not like to wear a livery. With them servitude forfeits no rights, but bestows a claim. I hear often reproaches made of the ingratitude and mercenariness of Italian servants. This is unjust. They are grateful for acts of courtesy, and for trifling donations, which our countrymen would often scorn and forget; but I allow that their resentment is as easily excited as their love, and often sponges out the previous good will. But I have met with fidelity, disinterestedness, and warm attachment among them, and these are qualities rare everywhere, and not, alas! the staple commodity of any soil.

Your man-servant becomes just as confidential and communicative after he has been some time in your service as your maid. Mine consulted me seriously the other day as to an intention he had of marrying. As a delicate compliment to my nationality, he said he would prefer an Englishwoman.

"Non troppo, Signora," he said; "but with a little money."

I am so unromantic that I was not scandalised at this last clause. I like, as far as possible, an equality in all monetary arrangements between the sexes. If a woman brings her quota to the domestic outlay, it gives her, or should give her, of necessity, a voice and a potentiality in it.

Kindness to children is a remarkable trait in Italian man-servants. The patience with which they will try to please them and wait on them is wonderful. The understanding, too, between the old child and the younger one is very striking. These men have a susceptibility to impressions and an elasticity of temperament which is most child-like and appreciated by children.

I know no prettier sight than to see the tall, stout Ferdinand, with his moustache and black eyes, and ex-military air (he served in '48), sitting the whole evening with that little golden-haired, fair little boy on his knee, making him laugh with stories of his own childhood. To that child "Ferdinando mio," as he calls him, is a type of manly virtue and genius; to Ferdinando the "Signorino," is a marvel of precocious and angelic intelligence.

"E nostro Signorino," says Ferdinando, claiming him, as it were, and I am quite sure that his own children are not more beloved. That child is certain of having in that man a staunch and life-long friend. His having been born in Tuscany completes and crowns his perfections.

"Cosa vaole," the Italian explains, "he was born in Tuscany, how can he be anything but a Tuscan. I cannot consider him as a 'forestiere,' and then, 'e *così* gentile!'"

THE BALIA, OR WET-NURSE.

That woman with the large round broad-leafed Leghorn hat, trimmed with cherry-coloured bows and streamers, with her long heavy gold ear-rings, with the strings of real but uneven pearls round her brown throat, her large cherry-coloured bows on the shoulders, her bodice, called "busto," which tightens her waist under the full matronly frontispiece, so modestly veiled by the spotless

white handkerchief, is the balia or wet-nurse. She is usually a peasant woman from some of the villages clustered like nests on the Apennines. She sends out her own baby to nurse, and comes down to Florence to seek the situation of balia. She looks much older than she is, at first sight, for she is so brown, and constant exposure to sun and air has made her skin coarse and freckled ; but her features are pretty, and the face has a kind and gentle expression.

She absolutely dotes on the little baby who has replaced her own. Her patience with it is exemplary. The baby is the real Moloch (*vide* Dickens), to which everything else must be sacrificed. It must never be thwarted or contradicted. Strict disciplinarians, who would commence infantine education from the cradle, would be frantic at the indulgence she shows her charge.

Tuscan Balia, or Wet-nurse.

The baby chooses her to sit on the ground, she does so ; the baby will roll on the grass, it does so ; the baby will have her shoulder knots, they are taken off. This is very injudicious, no doubt, but the fault is compensated by untiring good humour, unvarying patience, unswerving gentleness. In my opinion, systematic and constant indulgence does less harm than spasmodic and uncertain petting ; and to trust an uneducated person with the repression of, or opposition to, a child's temper is a dangerous experiment.

A balia is eminently a person of one idea, and that idea is concentrated on the baby she nurses ; she thinks of nothing else,—lives, moves, breathes, for that alone. She is paid in proportion more than other servants, but the troublesome fancies of wet-nurses in other countries she ignores. She eats and drinks as usual, and no double allowance of porter, wine, or tea is required. In cases of infantine illness she is devoted and indefatigable, but easily frightened, and apt to despair on small provocation. She covers her face with her apron, and sobs. She is hopeless, and calls on the Madonna. The beginning and end of her philosophy is to kiss and to cry.

I remember seeing one of these women once, when the child she was nursing had a serious illness. It was thought it would die, and it was necessary to tell her of it. Her despair was touching. It was disinterested grief for the loss of her nursling, and not for the loss to herself. At the same time, when she could articulate, there was something so pagan and barbaric in her ejaculations, that it was quite ludicrous to hear her. She reproached her saints with the cruelty of taking such an "angelino" into Paradise, and expostulated on the injustice to herself, after she had taken such care of the child, had dressed it so neatly, and above all, had washed it every day! Such merit as the last deserved a different catastrophe, and was the hardest thought of all. Her patient love, her day and night watchings, and surrender of herself in every way to the well-being of the infant was natural to her; but washing it every day was an extraordinary good work, and should have ensured reward. Her affection for her foster-child is lifelong, and I have seen a balia speak to a bearded man in a general's uniform with the same tone of tender blandishment with which she must have addressed him as a baby in her arms. The foster-brothers and sisters have also a tie with the child their mother has nursed, which is mutually acknowledged, and rarely set aside. She is very obliging, too, and when she is at liberty, will help with the other servants, and do anything she is asked. Such faults as can be found in her must be considered as proceeding from her ignorance. She is untidy and thoughtless. With all her painstaking she does not dress the child committed to her care with the taste and comprehension of finery of an English nurse, but that may be excused when one remembers how strangely wrapped and swathed are the babies she is used to, and that all these frills, and laces, and feathers are incumbrances, in her opinion, rather than ornaments.

She is never so happy as when the child, disrobed of all its pomps and vanities, is held in her arms, and is drawing its little life from her own. She rocks herself gently backwards and forwards, and hums in a low tone, with that beautiful musical intonation of her country which is universal in all classes. The simple melody harmonises well with that soft cooing gurgle with which the supremely happy infant occasionally interrupts itself. Both faces, that of the nurse and of the child bear a look of dreamy, absorbed felicity. At length the little "forestiere" baby breaks off and turns, and opens its blue sleepy eyes on the vivid dark countenance bending over it. The contrast in type and colouring is most strange and picturesque. It has often made me think (with a slight variation of Campbell's pretty line "Morning led by Night") it is "Morning borne on the breast of Night."

THE SILVER CORD.

BY SHIRLEY BROOKS.

CHAPTER XCII.

What else passed between the two women in that chamber of death needs not now be told.

The sisters returned to London.

"You will write to Paris to-night?" said Mrs. Hawkesley, and they were almost the only words which she had spoken to her sister.

"Yes, I *will* write," said Laura, slowly, and as if the resolution was but half formed.

But it was needless, for, before the evening, Mr. Hawkesley arrived, with Arthur Lygon.

That evening Ernest Adair also met an acquaintance whom he had not expected to see again so soon—if ever.

He had lost no time in obeying the orders of M. Wolowski, had engaged a small room in one of the obscure streets between the Regent's Park and the great thoroughfare which lies to the west, and giving the people of the house an impression that he was a theatrical artist, and that his visitors would be connected with some place of amusement—thereby taking a character which, if the owner be tolerably solvent, is exceedingly popular among the lower class of lodging-house keepers—Adair, too restless to remain at home, made his way, and it was a long one, to the eastern side of the city. There he lingered, tolerably certain to meet no friends in the strange, bustling population of that district. About the wide, old, squalid, yet prosperous quarter, Ernest Adair wandered, and sought to interest himself in its noisy and multifarious commerce, in its open-air banqueting, and in its frequent quarrels, which the large infusion of a sailor-constituency somewhat relieved from mere ruffianism, and rendered a matter of course, amid the revelling, fiddling, and unceremonious love-making with which our sea-labourers beguile their leisure ashore. Adair had stopped, and been hemmed in by an unsavoury crowd that promptly gathered to behold a savage conflict between two fine-looking men who had, five minutes before, been affectionately forcing their money upon one another, but whom the demonstrative coquetry of a Cynthia of the minute had roused into jealous and vindictive rage. The fight was at its fiercest, and Adair was so far interested as to struggle for

his place in the front, when a voice behind him said,

"Bah! that's child's play; you cannot care for that, Monsieur Adair. The fools have knives, and don't use them."

Adair turned, and saw a coarsely-built man, with something of the foreign sailor about him, and whose long black hair and ear-rings, and the bull-neck below, suddenly recalled a scene of violence, the recollection of which had almost been extinguished by grimmer memories of more recent date.

"But he hits well, the fair-haired fellow," continued the other. "Only they have drunk too much to be mischievous. We should not drink when we quarrel, unless we mean to use cold steel, Monsieur Adair, should we?"

"You in England, Haureau?" said Adair.

"Why not. England is as open to me as to you, I suppose?"

"I don't know," said Adair, contemptuously, and affecting to watch the combat even more eagerly than before.

But it was soon over. Cynthia, who had needed a few moments to make adequate reply to the fierce reproaches of her female friends, enraged that a lucrative evening seemed likely to be broken up through a ridiculous sentimentality, had clawed away the bonnet from one, and dashed a handful of oyster-shells into the face of another, and having thus repudiated their interference, threw herself between the combatants, and with that curious distortion of mouth which among women of the inferior class indicates pathos, weepingly implored the champions to desist. Even to such tears as hers the sailor nature is very compassionate, and the men began to regard one another in a maudlin and reproachful way, which made it clear to every dissatisfied spectator that in two minutes more they would be drinking together with horrible oaths of everlasting friendship. Adair withdrew himself from the murmuring crowd, and proceeded on his way, when Haureau came up beside him.

"What do you mean by the answer you made just now?"

"What answer?"

"You said that you did not know that England was as open to me as to yourself."

"Nor do I, nor do I care."

And he walked on at a quickened pace. But though the powerful limbs of his companion were short, his power of step was great, and he easily kept abreast of Adair.

"Don't speak to me in that fashion, Monsieur Adair. I have earned the right to be used more civilly."

"I have nothing to say to you—you can have nothing to say to me—let us take our own ways."

"Mine happens to be yours—yes, and whatever yours may happen to be," added Haureau, as Ernest turned round. "Now."

"Then you have something to say. What is it?"

"I am not to be bullied, that is the first thing, Adair," said the other familiarly. "Don't try that game. What," he added, with a coarse laugh, "you were actually looking at that clown in police clothes—were you thinking of asking him to deliver a gentleman from the importunities of a low ruffian, who insists on addressing him. *Dieu*, what an aristo we have become since we used to fraternise with barbers, and that kind of *canaille!*"

"*Canaille*, as you say," replied Ernest, with as offensive a sneer as he could assume.

And with the air of one who is compelled to endure, he lit a cigar, and leaned against one of the rails which in that region fence the outlying merchandise of the shopkeepers.

"Thank you!" said Haureau, dexterously snatching the cigar at the moment of its illumination, and transferring it to his own lips.

Adair smiled, and lit another, as calmly as if no such insult had been practised on him.

"What, not angry!" said Haureau, emitting a large puff of smoke. "The English air agrees with your temper."

"Angry! With you, or with *him?*" replied Adair, quietly, and gently pushing away with his foot a dog that came up against him.

The retort stung Haureau, who showed his sumptuous white teeth with anything but a pleasant smile.

"You have no business, I tell you, to be so rough with me. I don't speak of the little affair at Silvain's," and he laid his brawny hand on the arm that Adair had wounded. "That *you* might remember, but I don't care to speak of. But I was waiting to be your friend on another occasion, Monsieur Adair, when you would have been more pleased to see me than you look at present."

"I am not aware of it."

"Don't tell lies, because I know you saw me. You see everything, even cards that you don't like. And on a certain day when you thought that two if not three strong-bodied Englishmen were coming to settle an account with you, I know that you were not sorry to see me standing about, ready to take a friend's part if needful."

"I suppose that you were ready to help me, or to strike me down from behind my back, as those who hired you might order."

"Perhaps I was, but then I never strike without orders, like some people, and in consequence I can walk about this town in freedom instead of skulking in quarters which I hate. That's near the mark, Monsieur Adair."

"I am leading the life of a *galley-slave*, eh?" said Adair, giving point to his words by a savage look. "I must not walk out of my yard. Very well. I am sure of your sympathy, Monsieur Haureau?"

"You are a brave fellow, Ernest Adair," replied his companion. "I always said that, and I never knew how right I was till now."

"Deeply obliged by the compliment. Have you any more compliments, or may we break off this interesting conversation?"

"We do not part in this way. We can be useful to one another, and I am sure that you will be glad of it. Where are your lodgings? I was thinking of proposing to come and stop with you."

"Ah!"

"That means that you don't feel inclined to give me a strong recommendation to your landlord. You do not like responsibility. That is

prudent. But I have plenty of money, see." And he thrust his large hand into his pocket and drew out a handful of gold. "I will pay in advance, if that is preferred."

Something in his tone told Adair more than his words.

"If you want my address," said Ernest, "I dare say that it will be furnished to you in good time. As I have private business to attend to, I will wait your visit instead of inviting you."

"That is rude and inhospitable. We sailors feel hurt by that sort of thing more than I can tell you."

"I am sorry," said Ernest, knocking off the ashes of his cigar.

"You do not ask me home, then?"

"Why should I?"

"Because, if the gentleman to whom you have sent your address should call, and you should not be at home, it will be very convenient that another gentleman should be there to apologise for your disobedience to the orders given you in the garret where your hands were held behind your back."

"Why not have saved trouble by saying so at first?" said Adair, calmly.

"I hoped that your kind and noble feelings would have made you show a more friendly spirit. I wish you were a good fellow as well as a brave one, we should be such excellent companions."

"My address is Beevor Street, Marylebone, my number is 16, and my room is the second-floor front. My name is Hyde, and the name of the landlord of the house is Pangbury," said Ernest Adair, walking away.

"Stop, Mr. Hyde."

"What more do you wish to know?"

"Have you sent that address to the person who was to have it?"

"Yes."

"How did you send it?"

"I left it at his office with my own hand."

"At what time?"

"An hour ago."

"He will not receive it until to-morrow, then, and a night is lost. There is some question of life or death in the matter. You are prepared to answer for the consequences of the delay?"

"I could not send an address until I had one."

"I have nothing to say to that."

"That is fortunate," said Ernest Adair, haughtily. He had borne much, but the discovery that Haureau had been placed in charge of him, galled Adair almost beyond expression. He had injured and insulted the man, and the reprisals which the coarse nature of Haureau would certainly inflict, now that he had an opportunity, promised to be more offensive to Adair than the cold cynicism of his Parisian colleagues. But he was in the chain, and the taskmaster was behind him with the whip.

"I shall have something to say about that when we meet at our happy breakfast," said Haureau. "I do not invite myself to supper, because suppers are not an English fashion, I am told, and because I have something to amuse me in this part of the world. Is it any use asking you to join me? You can do no good at home, as your letter is lying in that lawyer's box, and you may as well spend a pleasant night."

"I am going home."

"Yes, I hardly hoped to tempt the aristocrat, by offering him our humble amusements, and yet I could make you known, Adair, to some very good fellows, who would receive you warmly."

"I understand you. Let them find me out for themselves. I dare say they will be able to do so when it is necessary."

"No doubt. But I think you are a fool. Pardon my rough tongue, or don't pardon it, just as you like, it is all the same to me. Only I would ask you what good in the devil's name you think to do yourself by riding the high horse, and pretending to be anything but what you are? At least, what's the good of it with me? Do you think that I have anything to learn about you?"

The speech was brutal in tone and in words, and Adair replied with bitter contempt.

"Do you conceive it possible that I care one farthing, Haureau, what you know, or think about me? I thought I made it pretty clear to you just now," and he pushed forward his foot, "that I do not. But while I have a choice between my own society, and that of a gang of low ruffians, I shall avail myself of that choice. Make the best of that statement when you make your report to your master."

"I like you better than I ever thought to do. I swear I do, and I am devilishly sorry that you have shown yourself a brave fellow. I don't want to get to care about you, but your spirit is honourable, and I respect it. By * * * I should be glad to see you escape, after all."

"You are very good."

"No, I am not. But I have seen a good deal of fighting-life in my time, and a good deal of cowardice, and a fellow that can turn to bay, when the rope is round his neck—round his neck, did I say?—when the men below have hold of it, and are only waiting the gun to run him up aloft—I say that fellow is made for better things. I swear to you, Adair, that if you think I bear malice about this hole in my arm, you are out. I don't care for it a curse. I have had a worse cut from a screaming woman, when we had boarded, and cut down the crew, and were making the best of our prize. I bear no malice, and, though business is business, I'll stand by you, if I can."

And the ruffian and pirate, or whatever he had been, spoke with all the earnestness of his coarse nature.

"You can do nothing for me, Haureau," said Adair. "Do your duty, but let me alone as far as you can."

"I would do *that*," said Haureau, "but there's no latitude allowed me, my fine fellow. You are a dangerous man, and I don't let you give me the slip."

"Wolowski must be a fool," said Ernest Adair, very angrily. "A fool," he added with an oath. "When a rat's in a trap, what need of poking at him?"

"Some rats have sharp teeth, and gnaw their way through the best traps, Monsieur Adair, and I take it that your teeth are among the sharpest. But that's not my business. As for our friend being a fool, that may be, and in one respect I know he is, and you know it, too, or I'm mistaken."

"About Chantal?"

"Yes, and another."

"I do not know the other."

"Yes, you do. It was always a weakness of yours to be sweet on the women. So it was mine, in a way, in days when I had the means of showing it," and he laughed a laugh that perhaps meant a recollection of many a day of wickedness and cruelty. "You know the other."

"A woman?"

"A girl, then, which is nearly as bad as a woman. To hear her say Papa Wolowski, so pleasantly, one would not think that she had false keys to all his drawers and boxes, or that she made a copy of his private cipher, and sold it to his master. I don't blame her, mind you. She don't know whether she is his daughter, or not; but she knows right well that the chief of the bureau is quite too much of a gentleman to give her false diamonds for real ones."

Ernest Adair's face lighted up with actual pleasure.

"What?" he said, with almost a scream in his voice. "What?"

It was not in the nature of the population of that district to hear a question without replying, and quick, if low, was the answer given, impromptu, by a passer-by, and loud was his laugh at his own ribaldry.

"Beast," said Adair, but uttered in good temper. The fellow looked round, but the figure of Haureau did not exactly invite insult, so the other went on his way.

"Do you tell me," said Adair, coming close up to Haureau, "that the demoiselle Madelon—"

"I thought you were such friends with M. ——, that he told you everything. But he keeps a woman's secrets, I suppose."

"She sells Wolowski!" said Adair, exultingly. "O yes, her father; he is her father, there is no doubt of that. *Dieu!* if the brute can feel, he will like that. Good little Madelon!—good little girl! I love you, Madelon!"

"Don't say that. It may make M. —— jealous."

"Ha! and Chantal, too, who is engaged to be married to her—he will be a happy man, the good Chantal!"

"I've told you pleasant news, then, Monsieur Adair."

"Yes," said Adair, fiercely, "you have told me pleasant news, and if you care to be thanked, I thank you. I had given up all hope that I should ever have a chance of stinging that cold-blooded villain, and here, in the middle of my ruin and helplessness, you come with news that he will be stung to the very quick by the only person he cares about in this world. That is good news, Haureau."

"Go home," said Haureau, with a kindly oath. "I don't want to like you, I tell you, and you are making me do it. Now you speak like a man. Go home. I will see as little as I must of you, and whereas I was coming to breakfast to-morrow morning, I will be damned if I come near you. Can I speak more friendly than that?"

"Where are you going now?"

"I can show you, but I can't tell you."

"Show me then, for I won't sleep till I have drunk to the health of Madelon Wolowski. I'll go with you, Haureau, no matter whom we go to meet."

"A gang of low ruffians," quoted Haureau.

"Very likely, but they'll not refuse my toast."

"Not if you proposed the health of M. Satan."

Haureau thrust his huge arm across the arm of Ernest Adair, and they plunged into an abyss of narrow and evil-smelling streets, and made their way towards the river.

CHAPTER XCIII.

So, for the first time during the period of our story, husband and wife were under the same roof.

At the sound of wheels, Mrs. Hawkesley had rushed to the door, had received the affectionate kiss of her husband, and had received Arthur with unusual warmth. Then she hurried the two men into the library.

"You know that Laura is here," she said to Lygon.

"I expected to hear it," was the calm reply.

Beatrice looked at him wistfully, and then said—

"Charles, I must tell all, though I had meant to tell you first. Charles dearest, and Arthur, I have such good news for you, for us all."

And her eyes fairly ran over as she spoke.

"It has all been a wicked, base, conspiracy. All is confessed. The letters are forgeries, the horrible letters that imposed on poor Robert. Forgeries, by that wicked woman at Lipthwaite, helped by the villain Adair. She is on her death-bed, Charles, and she has confessed it all. I was there, and heard her. Arthur! do you hear me, forgeries? Charles, why is he not on his knees thanking God?"

"He will answer for himself, Beatrice," said Charles Hawkesley, gravely.

"Arthur!" exclaimed Mrs. Hawkesley.

"This is Mrs. Berry's confession, do I understand you aright?" said Lygon, in a low voice, but without agitation or excitement.

"Yes, yes. This very day. We have been at Lipthwaite together, Laura and myself, and it has all been told. Mr. Berry was present, and has made notes of what she said. Arthur! Why do you stand so coldly looking at me? Laura is in the room above."

She spoke as if she expected him to make one rush from the room to the arms of his wife. But he did not move.

"Is he too much astounded to speak, Charles?" said the impetuous Beatrice, turning to her husband. "Is the happiness too much for him? Let him divide it with Laura."

And she turned to the door, and then looked back at the faces of her companions.

"What does this mean?" she asked. "Is there any new sorrow come upon us? No! I have my husband, you and Laura are here, and all the children are well—what harm can the world do us? Charles, why are you silent?"

"I see all that your kind heart means, Beatrice," said Lygon. "It is sad to have to answer you as I must do. You have believed that all was over, and that after my hearing what you had to tell

me my happiness would be restored to me. This cannot be."

"Cannot be?"

"I will not now discuss a painful subject. I have put your husband in full possession of my views, and he will explain them to you."

"Explain!—I want only one word. Laura is in the house, and that wicked evidence against her is scattered to the winds—why is she not in your arms?"

"Be calmer, dear Beatrice," said Charles Hawkesley. "There is, unhappily, a feeling which is not to be removed by your appeal—it has not been removed by graver arguments. Arthur must take his own course."

"He shall hear his wife, however!" said Beatrice, agitated, and going to the door.

"Stay, Beatrice," said her husband.

"You, too, tell me to stay. What *is* this?"

"Do you think I would stop you for a second, if it were not necessary? Arthur, will you tell my wife why it is necessary?"

"He has offended *you*, I see," said Beatrice, quickly.

"He has grieved me. But that is not worth a word. Let him tell you—or shall I say it for him?—that no reconciliation with Laura is possible."

"Arthur—are you mad?"

"Not so mad, Beatrice," said Arthur Lygon, in cold, measured speech, "as to risk my life's happiness twice."

"Risk! You are speaking of my sister."

"I am speaking of my wife, even a better guarantee, Beatrice, that I should not speak lightly."

"You will break her heart!" exclaimed Beatrice, passionately.

"It will not be so."

"Oh, Arthur! it must be my fault. In my hurry and eagerness to tell you the good news, I have told it badly, and you do not quite understand me. Dear Arthur! Mrs. Berry, the wife of your friend, is dying, and confesses to having forged the letters on which Laura was condemned. You have understood me now," she sobbed, "fly up to her, dear soul, and assure her that she is to be happy again. What *is* it, Charles?" she added, piteously.

"I hope that Laura will long be happy," said Lygon; "but her happiness will be separated from mine."

"That it can never be."

"It could be once, and it had been well for us all if—if we had not been parties to a fearful mistake. But we will not make it a second time."

"For Heaven's sake, Arthur, tell me what you mean! Do you not believe this story which I have told you, this confession of a dying woman? If you could have heard the solemn way in which it was uttered—"

"I know it to be true."

"Bless you for saying that! Then what more is there between you and Laura? You have freed her from that wicked charge—what more?"

"That wicked charge! Beatrice, had that been all, how mad must Laura's conduct have seemed? They were bungling forgers, those wretches. Had their letters been all that could be brought against Laura, she would have laughed them to scorn. The villain who wrote them, and his accomplice, knew little of their business. Until I had seen copies of the letters, I hardly knew what to believe, but half a dozen pages sufficed for me. Copies have been shown me, and my only marvel is that poor Urquhart could have been deluded into the belief that such letters could have come from the pen of a woman whom I had called wife."

"She *could* not have written them?" said Beatrice, with tears running down her glowing cheeks.

"She could not. No English matron, whose taste as well as her heart had not been debauched by vice, could have written them—they are worthy the hands of a low profligate like Adair, and a half-mad and wholly bad woman like Mrs. Berry. Had those been the only evidences, Laura would have trampled the accusation under her feet, and have left her vengeance to me. I tell you, Beatrice, one glance at *those* letters was enough."

"Then what remains?"

"The other letters, which Laura is afraid to disavow. The letters that show she has loved and been loved, and by a man whom she has not wedded. It was for those letters that Laura went to France, and the story which they reveal is the story that parts us for ever."

"My God, Arthur Lygon! The mother of your children! Because when she was a girl, scarcely more than a child, she fancied herself in love with some boy who has long been dead, but who has much longer been forgotten by her."

"I know not whether the object of her love be dead, or be alive, nor is it of importance. She was a woman when she wrote those letters, and she loved the man to whom they were written. Had I known it, she had never been my wife. As it is, she is my wife no longer. Let those words suffice."

"Charles!" gasped Mrs. Hawkesley, "are you a party to this madness, this cruelty? No, I am sure you are not."

"I am not."

"He is not—I will not pause over your words, Beatrice—let me say that your husband is unable to understand my feelings, and has laboured with a zeal which ought to do more than satisfy you, that it is my duty to accept such love as Mrs. Lygon can offer me, and for the sake of the children to forget the deceit of the mother."

"And was it *so*, Charles, that you urged the case of Laura?"

"Again I ask Arthur to reply."

"I see," said Lygon. "I have expressed my own feelings, not his. He is pleased almost to ridicule my feelings, and to condemn me for what he cannot understand. At the risk of offending you, Beatrice, I clear him from the blame you would give him."

"And God bless you, Charles," said his wife. "To you Arthur, what can I say, if you have shut your heart to such pleading as that which speaks for the mother of your children? This is indeed a new affliction, and I was presumptuous

enough to say that there could be no more for us. Arthur, if ever woman loved deeply and truly, it is Laura. She has been devoted to you, and so proud of you that even when things have been said at which other wives might have taken fire—I might and should—I own it—Laura has been silent in her scorn of them—she knew you, and that was enough. If you could not see her love in her whole life, if you wanted the incessant assurance of it, indeed, Arthur, you did not deserve such a treasure as Laura. But even then you might think of her as a mother, and ask yourself whether one who so idolised her children, who watched over them with such perfect and patient love, had no place for their father in her large, warm, true heart. Oh, you know not what wild, wicked folly has entered your brain, what bitter tears you will one day pay for having been so wilfully blind."

"I honour your sisterly love, Beatrice; in return, believe in my suffering. Now we will say no more on this. I had wished to spare you such an interview, but I was forced by your husband to assent to meet you. You have said nothing that I was not prepared to hear—do you need to be told that I would give my right hand to feel as you would wish me to feel?"

"See Laura," sobbed Beatrice.

"Why inflict needless pain? She cannot desire to see me, after what has passed, and it is better for both that we should make our arrangements through others. Your sister, Beatrice, will have no reason to complain of me. I leave all in the hands of Charles and yourself."

"Arthur, she will die."

"Spare such appeals, Beatrice, because they force from me answers which I am grieved to make."

"She will die."

Arthur Lygon made no answer.

"Yes, Arthur," said Beatrice, "it is true. But I will not say that her heart should break for one who has shown how little he deserves her love. You will destroy her in another way."

"Beatrice?"

"Yes. Those children, whom she adores—"

"A word, Beatrice. Are you already so unjust towards me? Are you suspecting me of an intention to avenge myself—to repay Laura for her deceit, to punish her, in short? Think better of me. Your husband will tell you how far was such an idea from my mind—ask him."

"It is due to Lygon," said Hawkesley, "to say that his own resolution, taken without a word on the subject from me, is to leave to Laura the entire custody of the three children, with the single condition that they visit him when he desires it."

"Or at times of her own appointment—when she can best part with them," added Mr. Lygon.

"And men make law for women, and understand them no better!" exclaimed Beatrice Hawkesley. "Oh, Arthur, how little do you know Laura. How, if God is good to you—better to you than you deserve—you will look back with shame and humiliation upon what you have said to-day. Charles, dearest, I am not accusing you—it was not your province to know the depth of that loving heart, and yet you know it more truly than he who should have treasured it like his life. The custody of the children is to be entrusted to Laura," she repeated, bitterly. "Oh, if you knew! And you shall know it," she added, impetuously, "and I care not what follows."

Beatrice hurried from the room.

"Do not reproach yourself, Charles," said Lygon. "You did what you deemed right in bringing me here."

"If I reproach myself, Arthur, it is because I am helping you to inflict pain where it is undeserved," said Hawkesley. "I am in my own house, or I might say more."

The door opened, and Mrs. Hawkesley led in Laura to the presence of her husband.

She was pale as snow, and she trembled visibly. One glance, it was scarcely furtive, and yet timid as the look of a girl. She saw the worn and weary look on the handsome features of her husband, and then her eyes were turned away, and sought his no more. She had read enough, in failing to find that which woman reads with a glance of lightning.

Arthur Lygon bent his head in silence.

Mrs. Hawkesley spoke, and it was almost with solemnity—in a tone very rare in that cheery, kindly voice:

"Do not let us take one step more in a course which has begun in error, but which should not end in misery. Surely it is enough that one of three sisters is a miserable widow, through a fatal persistence in mystery and wrong. At least let the dead be mourned for, before we heap new sorrow on the living. Arthur, and Charles, I have brought Laura here, not that anything may be unsaid that has been said in this room to-night, but that you may understand something that was said by me. Arthur, your wife was in this house this morning, and refused to let me send for her children. Those children are in the house now, and their mother has not seen them."

"May I—may I not see them, Arthur?" said Laura, faintly.

"My God!" said Arthur Lygon, pained to the very heart at her tone. "Why have you not seen them? Why do you not see them? Could I know this?"

"Yes," said Mrs. Hawkesley.

"Beatrice!" said Lygon, in astonishment.

"Let me speak for her," said Beatrice. "Let nothing come from her lips that can add to the painful recollections of this time. How painful they will be, even when we are all happy, who can tell. Arthur, you do not need to be told how a mother's heart is throbbing to feel her children pressing to it—*you* love them, but what is a father's love to a mother's?"

"Why are they not with her?" replied Arthur Lygon, almost angrily.

"Because Laura will not look upon the faces of her children—yes, and you may sever them if you will, until her heart has broken—but she will not see her children until her husband has forgiven an error which, when she dares, she will explain—which meant, as he will one day believe, that she loved him too well to be wise."

"*May* I see my children, Arthur?" said a sweet voice, broken by sobs.

He was silent for a few moments, and the sob of his wife came upon his ear.

"I have long since forgiven," said Arthur Lygon.

Laura raised her head, and one look, such as should have been on his face, would have brought her with one rush to his arms. But the look was not there. She did not move.

"I have fully forgiven," repeated Arthur. "Let the children come."

Mrs. Hawkesley had not waited for the second word. A hurried cry of young voices without, a wilder cry from a mother's voice within, and for a moment, at least, that mother was happy.

(To be continued.

REPRESENTATIVE MEN.

Merchants.

THE POLOS: SIR JOSIAH CHILD: SIR DUDLEY NORTH: THE ROTHSCHILDS: JOHN JACOB ASTOR.

In the study of human life, as in ordinary human intercourse, we find fun and mournfulness always together; and there is scarcely a trait of human character which has not at once an amusing and a pathetic side. For one instance, very striking to an observer of modern English society, there is something as ridiculous as it is melancholy in the contempt which the vulgar of the professional classes parade for commercial occupations. To any one who knows what commerce has done for the world, and what sort of citizens the great merchants of the world have made, there is something ludicrous and painful at once in hearing the family of a provincial surgeon, or lawyer, thanking Heaven that they are not connected with anybody "engaged in trade." Youths and maidens of such families, and not only they but their elder relatives, escape from the charge of pride by alleging that commercial people are narrow-minded and money-grubbing; that their occupations tend to keep them ignorant, and to make them selfish, underbred, and unpatriotic. The landed interest, as we used to call it, had an equally contemptuous notion of the merchants, some time ago, though not on exactly the same grounds. The prejudice has given way, partly through the family alliances entered into by landed dignity and commercial wealth, and yet more by the introduction of the principles and methods of business into the practice of agriculture. Since our great landowners have learned that agriculture is the manufacture of food and other original products, they have begun to perceive the value and beauty of those economical principles and methods which are supposed by apothecaries' sons and attorneys' daughters to vulgarise the mind, and render traders of any rank unfit company for classes which have no interest in saleable commodities. If any one of my readers should be disposed to doubt whether such a view is really entertained in English society, let him take pains to learn what is felt and said in classes outside of his own,—whatever that may be: and he will find that Bonaparte's declaration that we are "a nation of shopkeepers," is still considered the most cutting thing he could have said; and that there is everywhere, from Belgravia to the village of two or three hundred inhabitants, an assumption of gentility and enlightenment on the part of divinity, law, and physic, which commerce finds it hard to despise. It is not to be denied that the aristocratic illusions of the professional classes are kept up by the characteristic faults of the commercial order, as, for instance, the political cowardice which is the conspicuous vice of the manufacturers and merchants of many countries at this day; but, when it comes to picking holes in one another's coat, every class has some success against its neighbour, and there is no profession which has not its besetting sin. The one which seems to beset them all is the ignorant pride with which they regard a vocation which wise men of all orders know how to respect.

It may help some of us to a right point of view to glance at two or three of the Representative Men of the commercial class, and see what they were like, and what they did.

The first who gives us any full and clear impression of the European merchant of the Middle Ages is particularly interesting to us just now, as the first European who ever entered China Proper. The Venetian family of the Polos afford an admirable example of their order; and Marco is the one we care most about, because he recorded what he did and saw.

In 1255 Marco Polo was playing about in the halls and balconies of one of the beautiful palaces of proud Venice,—the great city by which Europe itself was known at the ends of the earth. The boy was becoming old enough to be told about his father, whom he had never seen. He had an uncle Marco; and he had a mother who told him, as he grew able to understand, that his father and his other uncle, Maffio, were men of noble minds, who wished to extend the commerce of Venice, and to make out whether some fresh countries might not be visited, and induced to exchange commodities with a people who could fetch and carry the productions of all known lands and seas. In 1250, the father and uncle had gone to Constantinople, where they had bought precious stones, as the most convenient article to carry into unknown regions; and from thence it was understood that they had gone into Scythia. Beyond this, there was nothing to tell. Scythia meant everything beyond the route that commerce took on the Euxine. Nobody knew what it was like, or how far it spread, or what was the end of it. Ghengis Khan came forth from it; and there was a prevalent belief that a magnificent potentate dwelt in a country of singular wealth where the world ended in that direction; but there were no means of knowledge, and there was no use in going over such maps as there were at that day. Land and sea were set down by guess; and nobody yet dreamed of a passage by the south of Africa, or of the existence of the western half of the globe. Little Marco and his mother could only put together all they had heard of wild animals and strange birds, and wonderful commodities, and terrible warriors, with armies of horses (horses being almost as strange as elephants to the people of Venice;)—the Polos could only speculate and imagine, and desire and pray that the

brave merchants might come home soon. They were hardly looked for while Marco was a child; for, when people went exploring, they expected to be gone for a term of years; and merchants especially found it answer to sit down in a favourable place for months or years together,—besides its being usually difficult to get away in safety, except at rare intervals. But Marco grew into boyhood and youth; and still his father did not return. He was well taught and trained, so as to be fit for whatever destiny his father might be intending: but his poor mother could not wait for the end of her long suspense. When the father, Nicolo Polo, returned at last, Marco was nineteen, and had for some years felt himself an orphan.

It must have been one of the strangest first meetings between parent and child that ever took place. It does not appear that Nicolo had ever heard, with any certainty, of the boy's existence; for people who ventured into "Scythia" in those days gave up all hope of news from home: and now he found a fine manly young fellow, eager to hear of everything, from the traffic on the Volga to the grandeur of Kubla Khan. When on the Volga, the Polos had been warned of troubles to the west of the Caspian; so they tried to pass down by the east side, and lived for a time at Bokhara. They knew better than our poor countrymen of this century how to hold intercourse with Tartar potentates; and they were safe and prosperous where Wyburd and Stoddart and Conolly underwent captivity and death.

At Bokhara they won the admiration of a minister of the great Emperor of Tartary, who persuaded them to go with him to the Emperor's court. For the chance of opening all Asia to Venetian commerce, and seeing what could be made of "far Cathay" and its reputed wealth, they agreed to undertake this journey of a whole year from the court of Bokhara to that of Kubla Khan, in Chinese Tartary. It was in 1265 that they arrived there. The great Khan knew about as much of the West as Europe did of the far East. He wished the Pope, as the head of Christendom, would send him a hundred wise men, to instruct his people in all sorts of knowledge. The Polos carried this petition to the Pope. By some means or other, they got passed through to Syria, from the coast of which it was easy to reach Venice.

They had achieved such a commercial success, and saw so much more in prospect, that they were eager to return to Tartary; and young Marco was eager to go with them. Owing to a change of Popes, it was some time before they could get on with their errand: and they started at last, at the end of two years, without any answer, dreading lest the Emperor should suspect them of bad faith. They had again left the coast of Syria when they were called back to receive credentials, and two monks laden with presents from the new Pope—all destined for Kubla Khan. The monks, however, turned tail on finding that the Soldan of Egypt was in force on their route. The Polos persevered, and reached Balkh, where young Marco was so ill that they stayed for a whole year. When we read of these long pauses, we must remember that the adventurers were trading all the time, or learning the commercial methods of each country and district. We must remember how small were the facilities for exchanging and transmitting money; and that, even at this day, time seems to be of no value in eastern countries. The promptitude and rapid action of Europeans, and yet more of Americans, is a subject of contemptuous wonder to orientals, who are never comfortable unless they lose as much time as possible over every transaction.

At last, however, the Polos were again on the march, climbing the snowy passes of the mountains, and traversing the windy steppes of central Asia. They were thirty days in crossing the desert of Kobi, and, after crossing Chinese Tartary, they presented themselves to their old patron. He was well pleased to see them again, and received the Pope's presents very graciously. When Nicolo presented his son, the Emperor looked benignly upon him, and gave him an office in his household. Marco was young enough to be flexible in such circumstances. He lived like the Tartars, learned four languages presently, and, by his general cultivation, obtained a strong and wide influence. It suited his purposes well that the Emperor sent him here, there, and everywhere on State business—one of these journeys being to a province which it took six months to reach. He was all the time making himself master, for future use, of the geography of these lands and seas, and of their commercial capacity and condition; for he was not satisfied with growing rich and powerful, like Joseph in Egypt, but yearned after his own country and his father's house. While he was acting as governor of a great city in China, his father and uncle were instructing the Emperor in the arts of war, and enabling him to take towns by the battering-ram and some new projectiles—the use of which was high military science in those days.

Meantime Kubla Khan was growing old: the Polos had been seventeen years with him, and they dreaded detention by his successor if they did not get away by his indulgence. He was hurt at the request, and conceived that they ought to be satisfied with such wealth as he could bestow: and he was willing to give whatever they might ask. Marco's opportune knowledge released them. In his rovings he had discovered that there was sea where our ships are now always passing to and fro: and he engaged to carry by sea to Persia a young princess whose bridegroom was awaiting her there, while the land journey was too full of risks, at the moment, for her to attempt it. The Persian envoys so desired his escort, that Kubla Khan yielded the point, and sent off the party in grand style. Fourteen four-masted vessels, provisioned for two years, carried many hundreds of navigators. The few details we have of this return from China—from Fokien to Venice—show us something of what it was that adventurous merchants undertook in spreading commerce in the middle ages. In 1271 and 1272 the Polos had ridden and marched through dry steppes and over ranges of snowy mountains: and now, in returning twenty years later they braved other perils. They coasted almost every country,

and probably took the diseases of all; for 600 men of their little fleet died on the way. The two Persian envoys also died; and when the expedition reached Ormuz, the bridegroom of their Tartar princess was no longer living; nor, as they soon learned, Kubla Khan. His death released the Polos from their promise to return and resume their offices, bringing with them other western Christians to improve his Tartar subjects. They were now free to do what they would with their remaining years.

It was in 1295 that three men of strange aspect appeared on the steps of the Polo Palace at Venice, and were going to enter it as their own, when they were ordered off. Two of them were old, and one middle-aged; they were dark-complexioned, and wore an outlandish dress, and their speech was difficult to understand. When they declared themselves Polos, they were treated as impostors. The absent Polos had long been supposed dead, and their relatives had inhabited the palace for many years. The applicants were evidently foreigners, and in no way resembling the Polos.

The strangers then named the families in Venice with whom their own had formerly associated, and induced them to assemble; and then, in a strange accent, and using many outlandish words, they related their adventures so as to be in part understood. Moreover, they unripped the folds and belts of their dress, and turned out such an enormous mass of precious stones as won the belief and veneration of all present. All Venice was soon at their doors, congratulating them. High offices were conferred on the old men, and Marco had no peace for the eagerness of the ladies to hear all about Kubla Khan and the land of Cathay. A population of millions was so wonderful an idea at Venice that the listeners gave the traveller the name of Marco of the Millions, and the family palace was known for centuries as the Court of the Millions—some, however, supposing that the emeralds, diamonds, carbuncles, and sapphires which were showered from the travellers' clothes originated the title, causing the Polos to be regarded as millionaires, as we should say in our day.

The old men settled down at home contentedly; and Marco's father married again, and had three more sons, when Marco was supposed to be lost. But Marco felt adrift at first, and as if he had passed from a familiar life into a strange one, so that he made no difficulty about accepting a naval command against the Genoese, a few months after his return. The Genoese were in that case the aggressors; Marco was called on as the most experienced navigator in Venice; and forth he went—only to be taken prisoner. He broke the enemy's line, but was not supported, and surrendered when wounded. The Genoese were proud of their prisoner, and treated him well, only requiring from him perpetual narratives of the Great Khan and far Cathay. Marco had soon had enough of this, and he listened to the counsel of persons who insisted that these things should be written down. He was assisted to obtain from Venice the original notes of his travels; and he dictated to a zealous scribe that narrative which is the foundation of all our knowledge of the far East.

That narrative suggested new ideas to the minds of successive generations, so that out of it came the conception of a continuous voyage, and the discovery of the Cape passage, on the one hand, and, on the other, of a westerly access to China and the discovery of America. Meantime, the nature and aims of commerce were prodigiously raised and expanded, and those results were obtained which follow from the bringing face to face of various tribes and nations. The first copy of Marco Polo's travels was made in 1298, and from that time more copies were made and circulated. The more his fame spread, the more decidedly did his captors refuse the great ransom offered by his father and uncle; but, at last, the citizens of Genoa began to be ashamed of so treating such a man, and they successfully petitioned the government for his release. He dutifully tended his father, and raised a monument to his memory; he was affectionate to his father's second family, by whom the family name was for a short time supported, as Marco had no son by the marriage he entered into at Venice. He left two daughters, and the name died out with a grandson of his father's. Marco's will was made after he was seventy; but we do not know the date of his death. What we know about his death is, that his friends implored him, for the salvation of his soul, to confess the lies he had imposed upon the world under the name of his travels, and especially to separate the true from the false in his narrative; and that he swore by his salvation that he had not only told no lies, but reserved in his own breast many things which his countrymen could not be expected to believe. Even this solemn declaration failed to satisfy society at the time, and it has required centuries to establish the rightful reputation of Marco Polo, the travelling merchant of the thirteenth century. Even now there are obscure or unintelligible parts in his geographical statements; but we have learned from former generations to wait for light instead of accusing our instructor. Lapse of time has so confirmed and illustrated Marco Polo's narrative that we are bound to respect where we cannot understand him; and he may not even yet have attained his full fame.

There cannot have been many other men who have so seemed to themselves to live two lives in one. His Chinese life,—the half of his mature years, must have been to him the most natural and familiar, as he took to it early, and formed his mind upon it, so that Venice must have seemed most like a foreign country. The link between the two was his commerce,—the character of commerce being,—at least in those days,—much the same all over the world; and everywhere it was honoured. It would not have been easy in the time of the Polos to find provincial, or even metropolitan people who congratulated themselves on not being connected with anybody "engaged in trade."

It is enough to refer to "the Royal Merchant" to whom the traders of London owed the comfort of a shelter, instead of standing in Lombard Street in all weathers, to confer on their affairs. Sir

Thomas Gresham is universally recognised as the model of a citizen, for enlightenment and public spirit. He had a university education; and then, as in natural sequence, served his apprenticeship as a mercer. It was his study and practice of trade that led him to those financial views which were a fortune to his country. He proposed and proved the policy of domestic, in preference to foreign loans; and this was a greater benefit than even the Royal Exchange. Queen Elizabeth could not have chosen him as the host of distinguished foreign visitors unless he had been a gentleman, as well as a man of extensive knowledge, and a skilled financier. It was a great thing for her, and for England, present and future, that there was a Thomas Gresham, three centuries since, "engaged in trade."

A hundred years later, when the horror of the Plague hung over London like a pall, a merchant who was thus driven from his business, sat at his writing-table in his country house, recording his notions on commercial matters for the public benefit. This was Josiah Child, a London merchant's second son. The national mind was beginning to grope about in need of some principles of political economy to lay hold of, and Josiah did his best to supply the want. No man could be expected to find the true standpoint at once; and Josiah Child proceeded on the then undisputed ground of the mercantile system, by which money is assumed to be something altogether unlike a commodity which has a relative value in the market. In spite of this fundamental error, there was so much that was wise, true, and fresh in Child's writings, that he at once took a high place among the distinguished citizens furnished by trade. He might partly confound cause and effect in treating of the benefits of a low rate of interest: he might take a wrong ground in defending the commerce of the East India Company: but he enlarged the public notion of the scope and operation of trade, and took much trouble to communicate his own enlightenment to society. It was he who also put forth proposals about the relief of pauperism, which showed us in what direction to look when reform became necessary. He thought a union better than a parish, and would have made every pauper work; but, seeing the difficulty of the competition with independent industry, he would have sent all paupers to the colonies. It is remarkable that he advocated a plan of centralisation, and would have established a corporate body of Fathers of the Poor, who should have saved every parish the trouble of its paupers.

Josiah understood his own business so well that he grew vastly rich, and married his children into aristocratic families. He was made a baronet at eight-and-forty; and when his third wife died, thirty-six years after him, above fifty great families went into mourning for her. I sometimes fear that the high spirit of the middle class of Englishmen is not altogether what it was,—seeing how aristocratic connection is made an object of serious pursuit. However this may be, it appears that two centuries ago, as now, the highborn do not object to obtain wealth by becoming connected with persons "engaged in trade."

While Josiah Child was writing in his country house, in the intervals of news about the Plague, the person who was to correct some of his mistakes was entering on manhood under peculiar circumstances. Dudley North, then choosing his course in life, (or having it chosen for him) had lived among the gipsies in his childhood,—having been stolen when his nurse's back was turned, and well hidden from search. Nothing could ever make a scholar of him, when he was at last found; but his whole soul was alive when there was any bargaining in hand. He was sharp enough at school about other things than his book: so his father bound him to a Turkey merchant, to be sent abroad. He went north and east,—to Archangel and Smyrna; and the world was much amused by the accounts he gave afterwards of what he had seen and observed. He learned the Turkish language, and gave his countrymen the first distinct notions they ever obtained of life in Turkey. More than this, he studied the course of commerce with such an open mind that he discovered the real function of gold and silver money in trade, and made some of his countrymen understand it when he came home, by answering Sir Josiah Child's doctrine about interest. It was in 1691 that this revelation was made to the mercantile interest in the "Discourse on Trade," which has placed Sir Dudley North among the early economists of our country.

It was partly at least to his parentage, and to his being brother to the Lord Keeper, that Dudley North owed his consequence in the city, and rose into some high municipal offices: but the same circumstances, and the political opinions which accompanied them, exposed him to vicissitude in the latter days of the Stuarts. If he had not been an enlightened merchant, he would not have been heard of now: whereas we hear of him, not merely as alderman and sheriff, and knight, but as one of those precursors of a great scientific period who, by sagacity, obtain a premature share of the wisdom which is to be disclosed. He stands in our history as the precursor by nearly a century of Adam Smith in one department of his researches; and this was not by closet meditation only, but by bringing strong observant and comparing faculties to bear on commercial topics; so that it was a blessing to his country that the mind early trained to sharpness by gipsy habits, was "engaged in trade."

Within the last century the leading merchants of all countries have manifested the same characteristics,—the enlightenment, the brave and shrewd enterprise,—which have distinguished their class in all times; and they have obtained the same substantial power and social consideration.

When George III. came to the throne there was a little boy at Frankfort who did not dream of ever having anything to do, personally, with the sovereigns of Europe. He was in the first stages of training for the Jewish priesthood. His name was Meyer Anselm Rothschild. For some reason or other he was placed in a counting-house at Hanover, and he soon discovered what he was fit for. He began humbly as an exchange-broker, and went on to be the banker of the Landgrave of Hesse, whose private fortune he saved by his

shrewdness, when Napoleon overran Germany. How he left a large fortune and a commercial character of the highest order, and how his five sons settled in five of the great cities of Europe, and have had more authority over war and peace, and the destinies of nations than the sovereigns themselves, the world pretty well knows. Despotic monarchs must be dependent on money-lenders, unless they are free from debt, and can command unlimited revenues for untold purposes,—which is never true of despotic sovereigns. Constitutional rulers are free from the responsibility and the difficulty, and our sovereigns are supplied by parliamentary vote, and need not stoop to borrow. Yet there is room for a Rothschild in London, where loans are negotiated for all countries, and which is a kind of central office for the financial news of all the world. In London, then, one of the sons—Nathan—settled. Anselm remained at Frankfort, Solomon went to Vienna, Charles to Naples, and James to Paris. Nathan was the leader, to whom the others looked up with reverence and confidence. He had assisted his father by his admirable ways of investing the moneys lodged in his father's hands; and he enriched his brothers by his wise guidance, and his generous extension to them of his knowledge and opportunities. He paid and provisioned our troops in the Peninsular War, and reaped the large profits which were his due for such a service; and from that time his fortune became colossal. He will be remembered in the financial history of the empire by his having introduced foreign loans into this country as a financial feature, as Gresham opened to our sovereigns the resource of domestic loans. Before the days of the Rothschilds, an Englishman here and there had invested his money abroad; but the difficulty of receiving the dividends, and the uncertainties caused by fluctuations in the exchange had confined the speculation to a very small number. Nathan Rothschild made the arrangements perfectly easy and regular, to the convenience of borrowers and lenders alike. Sovereigns and empires competed for his countenance, as his opinion decided their credit; and Spain has not yet got over the effects of his quiet steady refusal to enter into any money contracts with her or her dependencies. He was ennobled in Austria; but he preferred his personal consideration to any adventitious rank, and never used his title of Baron. The Member for London is his eldest son. Everywhere in Europe the Rothschilds are regarded as exemplars of the commercial character in its loftiest phase, in an advanced stage of civilisation. Their honour is proverbial, like the word of a king, or the gage of a soldier; their intellectual range is wide; their faculties are keen and sound; and their charities are in proportion to their wealth. Such are the results of a German boy having left the priestly calling to be "engaged in trade."

The romance of the vocation has not vanished from society with the progress of civilisation. We find in America now the personal adventurousness of three or four centuries ago, combined with the speculative ability which is the common form of commercial courage in our own day. If any reader should here neglect geographical and other distinctions, and confound all American commercial speculators together, I must remind him that the merchants of New England enjoy as high a character for probity, in the widest sense, as any commercial class in Europe. There is an order of merchants in other Atlantic States of the same moral rank, though afflicted with neighbours more fit for a repudiating region, on the frontiers of barbarism: but seats of commerce which have the highest reputation for the virtues and accomplishments of their traders are still in New England. Salem, in Massachusetts, for instance, known in Europe chiefly for the hanging of witches, seems like a European port of three or four centuries ago. There a ship-master puts his elder children to school, and carries his wife and infants on board, to go round the world, seeking their fortune. He starts with his ship in ballast, and steers for some wild place, to see what commodity he can pick up; and he sells his first cargo where he can buy a second; and so goes trafficking round the world, coming home with a fortune in his hold. It entered the head of one of these men to carry ice instead of ballast, and run to Calcutta. The Calcutta people were so taken by surprise that before the ice could be distributed, one-fourth was melted; but the rest brought six cents per lb., which was better than ballast. The next time the customers were more ready; and the price rose to ten cents. Since that time, the exportation of ice has become a lucrative trade; and the lovely "ponds" of Massachusetts afford a field of industry in winter, as striking as the scene of pleasure when the young people go sleighing. The pick and the saw are heard on the ice, as well as the bells of the sleighs, and the laughter of human voices. The celebrated Salem Museum carries one back to old times. It is the pride of every skipper and supercargo to bring home something worthy of a place in the museum; and it used to be the aspiration of every master of a ship to become a member of the Museum Company by having doubled the Capes of Good Hope and Horn. That feat is now so common that some other qualification is probably added by this time. The Salem houses are peculiar in their adornments; rare and fantastic shells, Polynesian matting, shining hempen fabrics from the eastern archipelago, Chinese products in greater variety than the English have supposed to exist, Chinese caricatures of the Dutch in metal, Hindoo idols, and so on, without end.

The great Representative Man among American merchants was, however, not from New England; and we are accustomed to associate his name with New York. He was, however, a German by birth, though his reputation is altogether American.

John Jacob Astor was born near Heidelberg; and there seemed no reason why he should not live and die a German peasant farmer, except his own strong impression that he should be a great man some day. He was one of Nature's speculators; and his mind shaped his destiny. He went, while still a youth, to London, and earned enough to purchase a handful of commodities with which to cross to America, at the close of the revolution,—a brother being already there. The particular direction of his enterprise was determined by his being delayed, like the passengers of

several other ships, for three months by the ice in Chesapeake Bay. The passengers of the detained vessels visited each other; and Astor made friendship with one who had with him a venture of furs. Astor sold his own goods, and bought these furs. His mind was fixed on the condition of the fur trade: he visited Canada, and learned the whole history and mystery of the North-West and Mackinaw Companies. It was a great object in the United States to break up, or evade the British monopoly of the fur trade; and Astor was just the man to do it. When, by a treaty in 1795, Canada was permitted to trade directly with the United States, Astor entered into a contract in London with the Great North-West Company for its furs, which he received in America, and sold to all parts of the world. He had establishments on the Canada frontier, and there found that the Mackinaw Company was sadly in the way.

He proved this so clearly that the State of New York granted a charter of incorporation to "the American Fur Company," so called, Astor being in fact the company. This was in 1809; and in 1811 he had, with some coadjutors from the rival British Company,—the North-West,—bought out the Mackinaw Company, and thrown together the elements under his command under the name of "the South-West Company." He became the master of all the stations within the American frontier; the United States government countenanced all his plans; and he was building up a mighty commercial scheme when the war of 1812 overthrew everything. Congress would not let Canadians trade in furs within the American frontier; and the Company was dissolved.

Astor had been putting together some separate facts about furs; and out of his meditations grew one of the grandest schemes that ever occurred to a private citizen. A sea otter which had a very fine fur had been found to abound all along the coast of the Pacific. This was one fact. Another was that the Chinese were the best customers for furs in the world, and that they especially prized the skins of this sea otter. A third fact was that explorers, British and American, had made out the Columbia River and Vancouver's Island. Astor seized on the idea of establishing a set of trading ports across the whole continent, following the Missouri, and lighting upon the sources of the Columbia, and following it down to its outfall into the Pacific, where a mart should be established which would bring Russian and Chinese custom. Small posts were to be distributed in the interior, wherever rivers ran and Indians dwelt; and a coasting traffic which would pick up all that was left. It was Astor who conceived the idea of carrying out an American population, with its resources and institutions, to the Pacific.

President Jefferson and his Cabinet were enchanted with the scheme. They promised such protection as they could afford; but it was a plan which must be worked out by the contriver; and it was little that anybody could do to help him. He had to struggle with the great British Company, and with the alarmed and treacherous Indians, in addition to the risks which always attend colonisation in a barbarous and ungenial territory. He could not be at both ends of his line at once; and his agents were such as he could get. As usual, some were wilful, some were stupid, some were jealous and discontented, some were the spies of the rival company. After a host of difficulties had been overcome, the settlement of Astoria was founded at the mouth of the Columbia; an expedition by land, and the dispatch of a fine ship, the Tonquin, with commodities and a company of traders, agents and interpreters, seemed to guarantee the establishment of a trading colony which would make the Americans masters of the Pacific margin of the continent. But there were cabals and quarrels on board the Tonquin: and, after reaching the Columbia, and proceeding on her coasting voyage, her ship's company was massacred by Indians, admitted in too great numbers; her last surviving inmate blew up her magazine, with a hundred Indians whom he had tempted on board again, and the surface of the sea was strewn with wreck and mangled bodies. The tidings of the fate of the Tonquin affected Astor more than any other bad news that ever reached him. Yet he had plenty. The land expedition suffered dreadfully from thirst, hunger, and the Indians; and it was eleven months in reaching Astoria in woful plight.

All might have ended as Astor had dreamed and planned, if he could have been present where most wanted, or even have voyaged and communicated by methods familiar to us now. But his mishaps were taken advantage of by rivals and treacherous or ill-judging agents; and, after the persistence of years, after a vast expenditure, and many a rally from defeat and disaster, all was over. Astor's property was sold to the North-West Company for a third of its value; and the British commander of a frigate was virtually welcomed to Astoria by Astor's own agent, who had induced the Indians (from among whom he had taken a wife) to lay aside their arms. The British captain was as much disgusted at the whole transaction as anybody, and threatened to compel the North-West Company to restore the value of the precious furs they had conveyed away: but he did his professional duty, which was to take possession in the name of King George, and to change the name of the settlement, from Astoria to Fort George.

John Jacob Astor will not be forgotten there, however. He will be remembered as the proximate cause of our great colony of British Columbia. His furs opened the way to our gold finding. It is not for this that I have sketched his enterprise, but because he is a modern representative of the ancient and perhaps eternal order of enlightened and enterprising merchants, with their mingled romance and shrewdness, ardour and caution, poetry and economy.

He bore his disappointment and loss with dignity, though thoroughly convinced that he was betrayed, and, in that sense, dishonoured. He said he could have better borne an honest capture by an avowed enemy, "in which there would have been no disgrace." There was no need for him to regret the pecuniary sacrifice; for he had more wealth than he could use. What he left to his family may be conceived of from the incident which happened the other day, when the

President had sent out his appeal to the Northern States for support to the Government, when the citizen Astor of 1861 placed at the disposal of the Executive a million of dollars as a free gift, and as many more millions on loan as might be desired. One wonders whether the anecdote has reached the hamlet near Heidelberg, where the name of John Jacob Astor may be still remembered,—the boy who went away about a hundred years ago, confident that he should be a rich and great merchant some day. HARRIET MARTINEAU.

A DAY'S FISHING.

SOME ten years since it became necessary for the writer hereof to follow some amusement which would take him into the fresh air for a day at a time. The doctor, with disinterested candour, told me that, unless I made a break in my business occasionally, and went away from it, the chances were that I should be laid up for a long time, as rest for the mind, and not physic for the body was the treatment which I needed.

Hunting and shooting were too expensive for my means, and, having always been a great lover of Izaac Walton's works, it suddenly struck me that, like "Venator" (in the good old man's work on angling), I might, with a little instruction, become a fisherman. Having invested a few pounds in fishing paraphernalia, which included a waterproof coat, leggings, and fishing-boots, I started off on a fine October day for a fishing village in Hertfordshire, where, if I did not find "an honest alehouse where the beds smelt of lavender and the walls were hung with ballads," I was lucky enough to light upon a snug little inn near the Lea, and, better still, found a goodly company of pleasant old fogeys—I use the word respectfully—who were discussing their day's sport.

Having dispatched my mutton-chop and cup of tea, I asked leave to light my pipe.

"Sir," said one of the company, "we were only waiting for you; we should have commenced half-an-hour ago, but we thought the smoke might not be agreeable whilst you were eating. Mary! four clean pipes and a jug of the old ale and some tobacco."

Conversation soon became general, though somewhat tainted with fishing. Feeling that I should be out of my depth in two minutes if I joined in fishing-talk, I made a clean breast of my ignorance of the noble art, but expressed a hope that, with the aid of Izaac Walton and the "Jolly Angler" (which, by the bye, is an excellent practical treatise on fishing), I should make something of it.

It really seemed a realisation of a scene out of Izaac Walton, for a kind old boy, who was going jack-fishing on the following day, undertook to be my tutor, if I would be his pupil, and promised me, if I had a taste for the sport, that he would teach me the rudiments of it. I fear that my good-natured old tutor is either too old for fishing, or has gone to his last home, as I cannot hear of him in the neighbourhood of his old haunts, but I owe him a debt of gratitude to this day, which I would repay if I knew how. It is a very kind action in any man to undertake to teach a raw pupil any art which he has himself acquired. The keen whist-player does not care for playing a rubber with a novice, nor does the professed cricketer relish a match with a lot of country bumpkins, and I have myself experienced the miseries of initiating a youngster in the art of fishing (my pupil had not a fishing mind), so I value my Mentor's exertions all the more.

I will not trouble the reader with a diary of my progress in fishing, nor will I attempt to teach him how to catch fish. There is Izaac Walton's book for him, if he wishes to learn the haunts and habits of fish, and the "Jolly Angler" will teach him all he wants to know about tackle, though a day's fishing with an old hand at the sport will teach him more. I simply wish to convince him that fishing is a recreation easily attainable if he feels disposed to follow it out.

To a man who appreciates the beauties of nature there is no sport which will introduce him to more pleasures than fishing; nor is there any pursuit better calculated to relieve the over-worked brain. There is something glorious in finding oneself by the river-side on a fine autumn morning, and to feel that a long day of rest and quiet is before one. It matters not to the angler whether funds are rising or falling, or whether kings and princes are making war, provided that he has a clear faith that a pike or large perch is lying in the pool where his float is bobbing. The angler's sole business in life *pro tem.* is to catch his fish, and to let the fresh morning air blow on his face, giving him health and appetite whilst he pursues his sport. He sees wild flowers which he never observed before, and marks many other beauties in nature which have hitherto remained unnoticed, for the simple reason that it would take a lifetime for a man to stand by a river-side and exhaust all that is worth marking or looking at. The *actual* fishing is simply the *backbone* of the *recreation* of fishing, as the real joys of the sport depend on the attendant incidents. Who would care to have an enormous tank filled with fish, and to sit between four brick walls and pull them out? Supposing that the tank was a mile wide even, who would care for the largest pike of the season if it came out of a colossal tub? The great charm is to wander by the river-side, to watch the currents and eddies, and try the depths; to calculate on the probable haunt of the kind of fish of which you are in pursuit, taking into consideration the season of the year, weather, and time of day; and having come to the best conclusion in your power, to prepare your tackle and go to work.

Salmon-fishing is a sport reserved for those who either live in mountainous countries, or who have time and money to go in quest of it. Trout-fishing, again, is generally a luxury only within reach of the Lord of the Manor, and the visitors at the great house, and of those who can spend a guinea a-day on their amusement; as all good club waters are mostly far away from London. Punt-fishing, again, comes expensive, unless two or three can form a party: but the solitary angler can for a little money get an occasional day's fishing, if he is content with taking chub, jack, perch, roach and dace. There are many spots on the Thames

where he can fish from the banks free of expense, though the best way of following his sport will be to subscribe to some water on the Lea, where, for a subscription varying in amount from 10*s.* to 2*l.*, he can always ensure a quiet day in the meadows by the river-side.

Doubtless many of these subscription waters are over-fished, and the capture of a heavy jack is not an every day occurrence, but there is usually a quiet little inn connected with them which is supported by lovers of angling, and where for little cost the visitor can get a comfortable bed, good plain country fare, and the society of anglers.

Old Izaac Walton's theory that fishermen are generally harmless, honest men, applies to these times as well as to his own days. I have mixed often with them at fishing inns, and my experience has been that a *fast* man would be much out of his element in their society. The evening talk runs mostly on gorge hooks, paternosters, hair lines, gut lines, and the like. Many a fish is killed over again, pending the enjoyment of solemn pipes, and occasionally in winter time a rubber at *long* whist for penny points, "with snuffed candles, a well swept hearth, and the rigour of the game" (as Charles Lamb says), varies the evening's amusement. Then there are good old stories of wonderful fish which have been caught in days gone by, and we never think of doubting the assertion of steady-going, old-fashioned frequenters of the house, "that fifty years ago the water was the finest in England;" nor do we question the weight—quoted from memory—of a pike which was taken in the Waterloo year by the narrator of the incident, who deplores the removal of an old weir where he landed his prize.

The working men at the East-end of London are, many of them, enthusiastic fishermen. Roach-fishing is their particular hobby, probably owing to its being the least expensive. A very little money will buy a decent roach rod and line, and a few single hair or gut hooks can be procured for a penny each; a pennyworth of gentles and a little crumb bread and bran, for bait, complete the equipment.

In spite of the menaces of Little Bethel, or Ebenezer, I have often walked by the river-side on a fine Sunday afternoon, and seen with pleasure some poor man intent on his roach-fishing, and not unfrequently accompanied by his missus and two or three children, who were enjoying their *al fresco* dinner near him. I do not smell brimstone in the enthusiastic cry of "*Father's got another bite!*" and when I think of the gaping gin palaces near the poor angler's dwelling, which are always yawning to receive him, and that he has preferred saving a little money for weeks past for this Sunday treat, instead of investing it in gin, I, for one, won't throw a stone at "that awful Sabbath breaker," which ugly title some well-fed Mr. Stiggins is always applying to him.

I am not going to enter on the question of Sunday fishing, beyond remarking that the overworked artisan, *not* your *underworked* nine hours' strike man, has a very good answer to any one who bullies him about Sunday fishing.

Let any one who wants to ascertain the value of a day's fishing as a relief to the brain, keep a diary of his day by the river-side, and compare it with a page of his working diary. Possibly the two diaries would run somewhat in this way: Monday: attended Perks. Mem.: press Johnson for two hundred pounds. Smith *versus* Cod-liver Oil Company—filed bill. Wrote Brown, Jones, and Robinson, &c.

Tuesday: by the river at 6·30 a.m. Run with pike; lost him round a post. Caught perch—weight, 1½ lbs. Second run with pike; landed him—weight, 4¾ lbs. Breakfast at 8·30. Sun hot from 10 till 4. Saw lots of dragonflies and kingfishers. 5: out of bait; caught seven roach, &c.

Any one who feels disposed to expend a little ready money on an outfit, and can get a friend who understands the mysteries of the gentle art to go with him once or twice, will have no difficulty in acquiring sufficient knowledge of fishing to amuse himself; and although he will never be an Izaac Walton, he will, if he takes a fancy to the sport, provide himself with a new pleasure in life which is inexhaustible. It is not a bad expenditure of money for a novice to go once or twice with a Thames fisherman in a punt; and—taking care to furnish such a commissariat as will keep the puntman in good humour—get a thorough good lesson or two from him. Old Izaac must be his text-book for all information relating to the haunts and habits of fish, though of course he must study some modern practical book (the "Jolly Angler" my text book) for instructions about his tackle.

If I have failed in pleasantly putting my hobby before the readers of ONCE A WEEK, let me now make amends by ending with a quotation from the good old Izaac.

Venator (*loquitur*).—"And as a pious man advised his friend: that to beget mortification he should frequent churches, and view monuments, and charnel-houses, and then and there consider how many dead bodies Time had piled up at the gates of death: so when I would beget content, and increase confidence in the power, and wisdom, and providence of Almighty God, I will walk the meadows by some gliding stream, and there contemplate the lilies that have no care, and those—very many—other various little living creatures that are not only created, but fed, man knows not how, by the goodness of the God of nature; and therefore I will trust in him. This is my purpose, and so let everything that hath breath praise the Lord, and let the blessing of St. Peter's* master be with mine—

Piscator (*loq.*).—"And upon all that are lovers of virtue and dare trust in his Providence, and be quiet, *and go a-angling.*" F. G.

* St. Peter the Fisherman was the favourite Apostle of Izaac Walton.

TANNHÄUSER.

In ancient days the gods were occasionally dethroned. Vulcan was literally kicked out of Olympus, and Apollo reduced for a time to tend the flocks of Admetus. But in the third century of our era, all the heathen deities were expelled together. Heine, in a charming essay

published first in the *Revue des Deux Mondes*, under the title of "Les Dieux en Exil," has described the fate of the banished gods.

Apollo acted as head shepherd somewhere in Lower Austria, until betrayed by the exquisite beauty of his songs, he confessed his divine character on the rack, and was accordingly put to death.

Mars, true to his vocation, after various changes, was last seen in the dress of a German Landsknecht, cutting and thrusting, at the sack of Rome, under the gallant Condottiere Frundsberg.

Bacchus entered the ecclesiastical profession, as a jolly fat monk; at the recurrence of the summer solstice he may still be seen, with his fat friend Silenus, and a riotous crew, brandishing the thyrsus amid the dancing Corybantes.

Poor old Jupiter! His fate is terrible. Banished to an island in the North Sea, called the Island of Rabbits, he sits, withered, old, and decrepit, attended only by a lean, featherless eagle, the picture of grim despair; glad to pick up news from a chance whaler.

Mercury, in the disguise of a Dutch merchant, acts as supercargo for the transit of departed souls across the North Seas; and Diana, true to her old vocation, follows in the train of the Wild Huntsman.

Venus, after the destruction of her temples, took refuge, with a licentious crew of nymphs, in an enchanted mountain, called the Mons Veneris, where she spends her time in riotous living. Woe to the rash, who, allured by the sound of music and revelry, seek her attractive court. For them there is no escape. Pleasure may pall, conscience may awaken, but the

captive knight cannot break his bonds, and escape from the arms of the vengeful goddess. This fate befel the noble Tannhäuser, whose adventures are told in a quaint old ballad, written apparently shortly after the Reformation. We have ventured to give a literal translation.

Good folks, now listen to my song,
'Tis of a noble knight,
And of the wondrous life he led
With Lady Venus bright.

This worthy knight, Tannhäuser, longed
Great marvels for to see,
And in the hill of Venus sought
Fair women's company.

"I love you passing well," she said:
"You may not seek to flee,—
You swore upon your soul," she said,
Never to part from me."

"Dame Venus, I never sware that oath:
My love for you is past;
I trust in Heaven's mercy now
To save my soul at last."

"What can you mean, Sir Tannhäuser?
O, spend with us your life!
My fairest playmate I'll give to you
To be your wedded wife."

"No other woman will I wed
Than her whom I adore;
For if I do I needs must burn
In hell for evermore."

"Why talk you of the flames of hell,
Which you did ne'er assay?
Think rather of my cherry lips,
Which smile on you alway."

"Your cherry lips avail me nought:
I loathe them from my heart!
In the name of all women's honour, I pray
You'll give me leave to part."

"You ask my leave to go, Sir Knight,
But that I may not give.
Stay with me yet, Tannhäuser dear,
And love the while you live."

"My life is sick and loathsome grown,
I can no longer stay;
Fair ladye, give me leave to go
From your beauty far away."

"Nay, speak not thus, my noble lord,
Your senses are not right;
Into my secret chamber come
And taste of love's delight."

"Your love to me is hateful grown;
I feel within my soul,
O Venus, noble ladye fair,
You are a fiend full foul."

"Alas! how can you speak such words,—
So sorely lightly me;
Now if you still remain with us
I shall revenged be.

"And if you yet will take your leave,
Of old men ask the same;
And still, I think, where'er you go,
You needs must praise my name."

Tannhäuser, Venus' mountain left,
In sorrow and repentance;
"I'll go to the holy city, Rome,
From the Pope to hear my sentence.

"And joyfully I'll tread the path
To learn God's holy will,
And hear from Pope Urbanus' lips
If he can save me still.—

"Urbanus, holy father mine,
My sins I sorely rue,
The which I grievously did act,
As I'll confess to you.

"One whole long year I did abide
With Venus fair to see;
Let me confess, and penance do,
That I God's face may see."

The Pope bore in his hand a staff,
Carved from a wither'd tree,
"When this dry wood shall bud and bloom,
May thy sins forgiven be."

"O, welcome back, Tannhäuser dear,
I've grieved for you full sore;
But now, my faithful, lovely knight,
You'll part from me no more."

"O, had I but one year to live,
But one year free from sin,
The sorest penance I would do
God's mercy for to win."

Full sadly then he left the town,
I wis his heart was sore:
"O Mary, mother, maiden pure,
Shall I see thee never more?

"Into the mountain I'll return,
Eternally to live
With my sweet ladye, Venus bright,
Since God will not forgive."

Meanwhile at Rome, in three days' time,
The staff began to sprout,
And messengers were sent abroad
To seek Tannhäuser out.

But to the mountain he'd return'd,
And lies imprison'd there,
Until the day of judgment, when
God will his doom declare.

No priest should ever dare withhold
From men the hope of heaven;
They who repent, and penance do,
Their sins shall be forgiven. L. D. G.

COTTON AND THE COTTON-SUPPLY.

PART I.

I fear we must all confess that the present—and chiefly so as regards Great Britain—is a mixed age of cotton and of iron. And this pair, apparently so uncongenial, work together on terms of vast mutual advantage. They are excellent co-partners. Of the two, perhaps, cotton may be said, in some sense, to have the ascendancy, inasmuch as iron, with all its rigidity of temper and hardness of heart, is made to bend to the needs and demands of its associate, whom it educates and conducts through the multiform stages of its career, and finally transmits to its local destination. In fact, much of its employment is in subserviency to the destiny of cotton. It is instrumental to its eminent success, and most complacent in discharging numerous offices of assistance; and in so far as the principal for whom the agent acts is always in this world the bigger of the two, cotton must be deemed a gentleman of superior consideration to iron. Then its direct influence on the creation of wealth is greater and more expansive.

Nevertheless, the affairs of this life are so linked together by a law of reciprocity, that it is impossible to determine the measure of those results which cotton would have attained, deprived of the auxiliary appliances into which iron has been converted. To say nothing of the immense facility which mechanical apparatuses have imparted to the production of cotton-yarn and cotton goods in their many diverse forms, the means of distribution afforded by the wonderful inventions of the age have accelerated incalculably the progress of the manufacture through the marts of the world. Till the time of George III., goods sent forth from Manchester to their several markets throughout England were carried on pack-horses at a speed averaging about four miles an hour. This, compared with their present journey over the whole world, by steamships and railway-conveyance, at the speed of twelve and twenty miles respectively in the same space of time, shows us at once that the uses to which iron has been put in promoting the cause of cotton are of a character it is hardly possible to over-estimate. The reflex action of

these two great interests is, in truth, such as to enhance the importance of both. How natural then the alarm lest those vastly extended lands from which cotton is so copiously gathered, convulsed with the dire conflict of human passions, should be made sterile by the bloody footsteps of discord; or a mistaken view of self-aggrandisement should counteract the beneficial opportunities of nature's prolific womb, and reduce this mighty little thing by the fetters of legislation to a slavery which would prove injurious to its world-wide utility. How suddenly but thoroughly have instincts been aroused, resources calculated, regrets for past apathy and carelessness converted into practical suggestions for an improved and more independent future. Europe, Asia, and Africa, that combination of the old world, which did very well once upon a time by itself, again holds up its grey head, and in the pride of primogeniture, and encouraged with reminiscences of a glorious retrospect, comes forward to pick up the falling laurels so long enjoyed in security by the far west. The prize is open to all who have the energy to strive. So great its worth that the decrepid members of the Sultan's dominions even are almost stimulated to actiou, as Egypt was, not many years since, in the same cause, with results so satisfactory.* Where possibility exists hope should animate with perseverance the endeavours to convert that possibility into a triumph. Let us look for a little into this cotton question; see a little what cotton is; what cotton has become; where and how it is produced; of what stupendous value and importance are its manufacturing and commercial developments, and how wide the area over which it exercises a jealous and undivided sway.

Cottou (the Gossypium herbaceum of botany) is a shrub. Its nature is tropical. In Asia, Africa, and America it grows wild. Although our chief supply of it comes from a country which numbers so few ages among the records of the world, the use of cotton is of very remote antiquity. Time was when we old-fashioned fellows of three-quarters of the world had cotton in abundance, and no South American planters were born or thought of. In Hindostan it existed in the days of Herodotus, and was even then employed as the raw material for an extensively useful manufacture made up by the natives.

Strabo, too, mentions both the shrub and the manufacture. If we feel any inclination to reckon cotton among its kindred products as their aristocracy of ancient lineage, by availing ourselves of the ingenious theories of the antiquaries, we are quite able to do so without concocting evidence for the nonce.

That respectable family, so long shut up in the ark, are said to have been, beyond all doubt, not only acquainted with the cotton-plant and the fleecy filaments contained in its pod, but likewise to have understood the valuable uses to which this wool may be applied, and enough of the mechanical arts to transform it into articles of raiment. Modern investigation seems to have proved that the old Egyptians, though well skilled in the manufacture of linen, were altogether ignorant of that of cotton. This was confined for long to the Hindoo, to whom it had been known since possibly the eighth century of the Christian era, when, according to this account, articles of dress were made of it, and starch used—as we use it now-a-days—for the uncomfortable purposes of stiffness and foppery. After this it were childish to refer to the book of Esther, where at chap. i. v. 6, the substance alluded to has been thought, or at least maintained, to be cotton. This date would be only about 519 years, B. C. Three hundred years later the Greeks are supposed, with greater plausibility, to have made use of cotton cloths which they obtained from India; so that, it appears, the favourite pursuit of Lancashire is a very old one, and the celebrity of the Indian for the beauty of her "webs of woven wind" is not by any means recent.

Pliny often speaks of cotton, and a certain Egyptian Greek — Arrian by name — renowned during the second century as a merchant and navigator, has written very descriptively about it. In those days Syrastrene or Cutch was a famous cotton manufacturing country, and in these the principality of that name cultivates the plant extensively, though the whole of its produce is exported in exchange for grain. But without indulging in the many tempting speculations suggested by diving into the ancient world for the origin of those marvels of manipulation which are ripening only in the modern, I may just observe it has been remarked that, in the earliest ages, nature and circumstances — that is, Providence —apportioned to the different countries of this earth as staples for the fabrication of garments, a specific class of material to each; to Palestine, Greece, Italy and their neighbourhood, sheeps' wool; to all the northern nations of Europe, hemp; to Egypt, flax; to China, silk; and to India, our protegé, cotton; where the textile arts, to which, in consequence, the natives devoted themselves, so likely to rise to perfection in connection with this ductile and seducing element, rapidly achieved the admiration of all the rest. The Hindoo finger to which belongs a sensibility, moisture and softness which marvellously adapt it to the office, guided by the peculiar patient temperament of the Hindoo mind, and working in conjunction with the simple distaff of India, forms a very perfect machine for spinning fine thread, which, though of late years far excelled by the almost invisible gossamers of Paisley and Manchester, being a production from short-stapled wool such as mechanical inventions fail to reduce to the same tenuity, is a wonder unequalled of its kind.

The muslins of Dacca, and the chintzes from the coast of Coromandel—pardon me if I excite uneasy emotions in the bosoms of the fair—bear glorious testimony to the dexterity and power of this delicate instrument. Sleight of hand is so indispensable an attribute of a perfect spinner, even with the aids of the truest machinery, that but few operative workmen out of the complement engaged in a mill rise to any great excellence in the production of the high-numbered yarns,—a singular instance of

* In 1821 Mehemet Ali introduced into Egypt the systematic cultivation of cotton. It is now largely consumed in the United Kingdom, and is so excellent in quality that the Sea Island cotton alone is held to surpass it.

which is shown in the fact that, from some cause not easily explained, the Glasgow weavers, in respect of the above quality, are unable to cope with those of Manchester. It must be admitted, therefore, that without doubt the men of Lancashire have as much gone a-head of their swarthy and all other predecessors in the manufacture of cotton as the American planters have excelled past generations in the cultivation of the raw material.

As we descend down the stream of time, looking out all the way for striking exhibitions of skill in handling cotton, we arrive at the peninsula of Spain, which during the 13th, 14th, and 15th centuries was renowned all the world over for abundance and excellence in the manufacture in question. This arose doubtless from the conquests by the Moors, who in subjecting the Spaniards to the evils of a foreign and unchristian yoke, to some extent redeemed these evils by the importation of much useful knowledge. At about this time the ladies of South Italy very commonly occupied their leisure in the fashionable employment of spinning into thread and knitting into stockings the cotton which was grown in their lords' gardens. It is a remarkable fact that the Mexicans, when under circumstances to them so unpleasant, they first made the acquaintance of Europeans, were found to possess a thorough knowledge of the applications of cotton, which was reared by this extraordinary people in profusion, and its manufacturing capabilities turned by them to good account. The Peruvians, too, at the epoch of the Spanish invasion carried on the same industry with similar advantage. It was not, however, until the end of the 16th century that the interests of cotton made much progress in Europe. The Dutch were the originators of this movement, and in what they did you may be sure they contemplated the advancement of trade, rather than providing for the trifling occupation of the idle and the fair. In the middle of the following century Manchester commenced her career of quick and unprecedented progress. The cotton with which she originally tried her timid hand, on work strange it is true at first, but destined at no far-off period to fructify in such immense results, came from Cyprus and Smyrna. Her chief rival, when she grew bold and daring enough to compete for a place among the experienced and famed, appeared to be Bengal. The Indian looms, rude as they were, and rude as they would have revealed themselves in any other but Indian hands, accomplished incredible feats. Zephyrs, the breath of the mountains, the wings of light, were reproduced in vegetable tissues so exquisitely fine and transparent that the Indian princess could never cover her naked charms by any possible multiplication of folded repetitions. Diapers were coveted by all the world, and purchased by a large part of it. Whilst they exported the finer goods, the coarser ones were fabricated on their own account. There were cotton shrubs, the fruit of nature, and cotton wool, that of art, in plenty for themselves and for us, nay, for all the spinners and weavers in existence. Lancashire might engage in an innumerable succession of trials without fear of exhausting the resources. Porto Rico, the West Indies generally, Peru, Egypt, Arabia, Syria, the Cape of Good Hope, the Isle of France, the Celebes, the East Indies, China, Persia, Ispahan, Aleppo, the Grecian Archipelago, Macedonia, Natolia, the coasts of the Caspian Sea, the Province of Bari, Calabria, and more places in the Levant besides than it were easy to enumerate, have each and all, in different degrees of perfection, reared this widely-diffused and much-requested plant. And nothing has yet been said of the vast plantations* in later times so profitably conducted in the Southern States of what I will still call the American Union. This grand step constituted a revolution in cotton husbandry, and of course affected with proportionate force every branch of its corresponding trade. The quality the most highly esteemed at this period of dearness and scarcity was that brought from the Island of Bourbon, and Smyrna used to send us annually no less than seven million pounds. There was not much to find fault with in the cotton of Bourbon, excepting its price, and this in 1786 rose in England to ten shillings the pound. In a minute we shall know more about prices, and then the above quotation will stand out in its proper exorbitancy.

Manchester is the first town on record that won a reputation for the fabrics she produced from cotton, as she had long previously done for those woollen articles which were destined in time to be so generally superseded by her subsequent innovations. The germs of mighty results were gradually developed by capital, industry, and science. The growth of the cotton interest was steady and irrepressible; moreover, it was rapid and on a scale of magnificence. The old factories devoted to the fabrication of woollen goods, which since the reign of Edward III. had been established at Bolton and Manchester, served as a preparatory school for acquiring the arts of the new manufacture. This traces back our obligations to the Flemings, who had been invited by that monarch on the occasion of his marriage with the daughter of the Earl of Hainault, to settle in this country, and import their skill in weaving to the good folks of these towns. Speaking of this latter city, as it impressed one in the time of Henry VIII., Leland says of it even then, "It is the fairest, quickest, and most populous town in Lancashire;" and in reward for the distinction it had earned, its royal master conferred upon it, in 1540, the privilege of sanctuary, a species of favour it is well for us we have long ceased to receive or appreciate. This celebrity was recognised in an act passed in the reign of Edward VI., in which its cloths are alluded to in complimentary terms. In the middle of the 17th century Levant cottons were worked into fustians, vermillians, dimities, and velvets, and linen from Irish thread was woven into cloth by the Lancashire artisans. The revocation of the Edict of Nantes in 1685, drove multitudes of weavers out of France in search of a safe asylum, and as England has

* The area of the States appropriated mainly to the cultivation of cotton, exceeds four times that of Great Britain; or, to give another idea of its extensiveness, fancy twice that portion of the Russian Empire comprised in Europe, covered with cotton-fields; not forgetting, all this while, that, enormous as is the produce of such a domain, many large tracts of country in other regions contribute to meet the unappeasable consumption.

always promised this accommodation, the refugees made choice of the vicinage of Bolton, where they soon fraternised with their brother craftsmen, and in requital for their hospitality, taught them much which conduced to the further prosperity of the neighbourhood. The natural advantages of the manufacturing parts of Lancashire are just what constitute the conditions of eminent success. The Mersey and the Irwell water the district abundantly, the coal found there supplies with facility the important article of fuel, and the proximity of Liverpool to the city of Manchester, which is the acknowledged central mart of the vast circle of towns and villages wholly dedicated to the spindle and the loom, affords the best means of importation and exportation which for every commercial purpose cotton in the raw state, and cotton in its transformed state could possibly have required.

The ancestors of our cotton aristocracy were in George the First's time a very homely, sturdy, hard-working set of people. Dr. Aikin has told us how they rose at five, breakfasted off oatmeal porridge at seven, took along with them to the warehouse, the counting-house, or the mill, a long string of children and apprentices, many of whom were the younger sons of country squires, and thus fortified with the health of morning and the strength of an unluxurious diet, passed the whole day in unremitting toil at the duties of their vocation. In this age, too, the public roads, when coaches were slow, canals few, and railways not conceived even in the tales of fairy-land, were covered with their riders, carrying bags stuffed with patterns of the goods furnished by the houses they served. In due time, machinery giving to the manufacture an impetus which elevated the mill-owners several grades above their former merely successful condition, they were compelled to call in to their aid a complete apparatus of mercantile enterprise, and then commenced that era of progressive prosperity which is the leading phenomenon of commercial history. But as yet it was not so. Every votaress of the wheel and distaff sat at her cottage door, in the manner of her Hindoo sister, but less blessed with the talents which lead to eminence, and spun the slender thread for the weaver to convert by the process which was peculiarly his, into the cloths and stuffs required by trade. No marvel we did so well without the shipments from New Orleans, all of which came forth in obedience to the iron wand of mechanical invention. And let us now look a little more exactly into the supervention of these wonderful days.

Cotton of modern culture has attained incomparable pre-eminence in America, especially the Sea Island, which is the best produced. In 1840 this description obtained in Liverpool the enormous price of three shillings the pound, whereas (for there is nothing like a contrast) Surat cotton, which is the worst growth of India, has been as low as two-pence. These may be regarded, perhaps, as the two greatest extremes between which the commercial value of cotton has as a rule oscillated. Then to show more completely how considerable this variation has been, I may as well give the lowest price within late years of Sea Island cotton, namely, ninepence the pound, and the highest of Surat, which in 1850, fetched 6¾*d.* The old commodity "tree-wool," which arrested the observation of Herodotus, Strabo, Arrian, and Mela, has never, you see, in modern days equalled when at its best and in the dearest market, the worth of the worst quality in the cheapest market of that improved edition of the article which the skill of Americans and the superiority of propitious local conditions have since those benighted ages contributed to create. Enlightened by these simple statistics, we now perceive how momentously the welfare of the cotton dealer is likely to be modified by any extraordinary and exceptional causes liable to augment the already excessive fluctuation upon which he must calculate in the price of his purchases. From 9*d.* to 3*s.* for the best sort is a wide range of fluctuation, and from 2*d.* to 6¾*d.* for the worst, is almost as bad. What a world of room to cramp the operations of a market, and finally to shut it up altogether. With the deficiency, the uncertainty, the inferiority consequent upon a combination of political influences added to this normal state of variation, how tremendous would be the increase of the difficulties to be met. If not for the sake of anything else, at least for the sake of Manchester and her vegetable nobility, let us do something towards the stability and extension of a market, we most of us can do so ill without. It is computed that directly and indirectly, 4,000,000 of our people are concerned in cotton industry, while the mere manufacture as carried on in Great Britain alone, employs directly according to Mr. M'Culloch's estimate, no fewer than 1,400,000 persons.

Although it is undeniable that it was in consequence of the call for cotton-wool being stimulated by the increased consumption resulting from the various inventions of mechanical genius, that the energetic and systematic cultivation of the plant in the Southern provinces of the Union began and flourished, samples of the new material were sent over to Mr. Rathbone, an American merchant residing in Liverpool, so early as 1764, when he received from his correspondent in the United States eight bags of Transatlantic growth, as a specimen of what that country could produce. This to a great extent might have been objectless and indefinite, for it was not until 1785 that the cotton husbandry of the American States commenced in right earnest, after Hargreaves and others had imparted a momentum to the trade which has been augmenting ever since. Georgia and Carolina were the two States which at this date turned their thoughts in this profitable direction. They were sufficiently acute to guess and calculate the highly remunerative character of the speculation. The seed came from the Bahamas, which in the first instance owed to the Isle of Aguilla, in the Carribean Sea, the origination of the most esteemed species. This in the language of botany is the *Gossypium Barbadense*, which includes every variety propagated in the United States. In commercial phraseology all the raw cottons coming from New Orleans, and called indiscriminately by the Liverpool brokers, American cottons, are classed under two comprehensive descriptions, the long stapled and the short

stapled. The great valley of the Mississippi and large tracts of country extending of late years far and wide into the Texas, form the grand area of plantations which in their luxuriant fertility yield an annual crop of more than 30,000,000 lbs., in weight. The Sea Island variety above referred to as the most valuable, is of the long-stapled class. Its wool is slightly yellow, very silky, and of unusual length. Its seed black. The islands upon which it is grown—hence its name—are situated along the coasts of South Carolina, Georgia, and Florida. One cause of its superiority is to be found in the nature of sea air, which varied experience has taught the planter is indispensable to the perfection of the cotton shrub. Indeed so great an affinity exists between this plant and the saline principle, that sea mud is actually applied as manure to the ground preparing for its reception. Dr. Ure in his work on the "Cotton Manufacture," records the following somewhat important fact:

"Dr. Wallich brought home several samples of cotton from the coast of Martaban to the India House, which were grown near the sea. They were not exceeded by the cotton of any other country in the quality of the staple * * * There is a village in the Mangrole in Kattywar, which produces a small quantity of very fine cotton. It is cultivated by natives, and grows only on one particular spot of small extent near the sea coast."

In corroboration of this partiality for a marine situation, I may further quote the result of an experiment tried in India; namely, though cotton grown from seed sown in localities near the sea (the experiment was made with Bourbon seed), may be found to thrive to an extent in every way satisfactory, transplanted to an inland spot (for the cotton tested was removed to Benares), it will probably prove—as in the case in question it did prove—a total failure.

The multifarious kinds of the plant from which the cotton wools are gathered present much dissimilarity of size and appearance. Sometimes it assumes the character of a shrub six or seven feet high, and at others it raises itself above the earth only three, or even two feet. The foliage, too, of these varieties takes very distinctive forms,—the vine-leaved, palmate, and many more. The flowers, the seeds, and the filamentous down investing them, which is the wool of commerce, are of different tints. As regards this last, the fact may be seen in the material called Nankeen, the peculiar colour of which proceeds from that of the natural filaments of which its texture consists. Neither is there any very rigid resemblance of constitution among them, for all undergo so many modifications when acted upon by the influences of soil, climate, and mode of husbandry, that both in the field and in the market their characteristics are widely separate. In some places the plant is an annual, but is sown on the same land only every third year; whilst we have in others shrubs which flourish and yield wool during the whole of that period. At Pernambuco, Brazil, and in the Leeward Islands, the shrub is triennial: a small quantity of wool is borne the first year, more during the second, and after the third it is abandoned. But all the plants of the Southern States of the American Union are annuals. It seems to be an ascertained fact, however, pervading every region in which cotton has been cultivated, that it exhausts to a very alarming degree the generative and nutritious virtues of the soil upon which it is grown; so much so, that the produce of the same fields which when first brought under cultivation was immense, has in many instances dwindled away in the course of a few years to comparative insignificance. In such parts of colonies as abound in cheap and plentiful land, it has often been the habit, as the soil gets drained of its fertilising properties, to remove the culture from spot to spot, in preference to adopting any of the less salutary and more precarious expedients of manuring, dressing, and shifting crops. The old lands in Guinea are, for the purpose of renovation, frequently inundated with sea-water.

The low, sandy islands scattered along the coast common to South Carolina and Georgia, appear, when viewed from a distance, or by superficial inspection, to be territories as diminutive in value as they are in dimension. But here it is that the universally celebrated cotton which has contributed so essentially to the marvellous achievements of Lancashire, is reared in all the honour and glory of what is seemingly an indestructible monopoly. Most of these yellow little islets, merging, as it were, thus shyly from the shallow waters of the shore, were formerly covered with extensive pine barrens. Where we now hear the imperious voice of man, and behold the fruits of his transforming labour, a hundred years ago the silence of nature was unbroken except by the cry of the lone sea bird, whose wild music chimed harmoniously with the surge, or melted away in unaccompanied melody over the broad sea, sleeping calmly round about. To the poet, the painter, the goddess Nature's devotee, their beauty, their worth, their moral, was then infinitely more precious than now; but the planter, the spinner, the political economist,—with slavery on their shores, I cannot add the philanthropist,—view the verdure of the cotton leaves and the hoary crop of its blossoms in relation to another class of beauty, another code of sentiments, another school of teaching. This sort of agricultural industry was not unknown in South Carolina so early as the very commencement of the last century, when Governor Smith introduced it for the first time. The idea was a happy one, and circumstances proving auspicious, Georgia, Mississippi, Louisiana, Alabama, and other contiguous states gradually took it up, and together they eventually became the gigantic cotton garden of the world. Of comparatively recent date, however, is the distinction gained by Texas. There are warm advocates for enlarging the sphere of operations which this country affords. Its natural advantages are said to be almost unlimited in regard both to the quantity and variety of the cotton it is capable of producing. Besides these recommendations, the salubrity of the climate, and general productiveness of the soil, have had their effect in inducing enterprise to urge forward a work which is likely to prove successful.

As all the world knows and laments, the cultivation of this wealth-creating, work-providing shrub is, in America, carried on entirely by slave-labour; and it has been maintained that the substitution of free labour would so run up the cost of picking—picking especially, for picking is a dilatory and tedious operation,—as to act fatally on the question of remuneration which the planter is of all men most anxious to adjust on a satisfactory basis. It need hardly be added, that this short-sighted policy takes the form of an apology, put forward by those whose silly apprehensions for their own selfish advantage preponderate over the sagacity, liberality, and charity in which the cotton-planters, as a class, are not deficient. The slaves thus supplying the field-labour of the states, number, in the low country, three-fourths of the entire population.

Before the enhanced demand for cotton promised such flattering results to its cultivators, rice, indigo, maize, and tobacco were the principal vegetable products of South Carolina. Now, whilst this last has taken the place of indigo (indigo having fallen almost entirely out of cultivation), cotton has become the great staple of exportation, 20,000 bags being yearly sent away from South Carolina and Georgia alone. The further extension of this kind of agriculture, however, does not appear possible in the United States, for physical reasons lead us to conclude that it has already nearly, if not quite, reached its climax. In 1859-60, the supply from this quarter amounted to 4,675,770 bags, whereas the present year produced but 3,700,000, a disparity not to be accounted for by any of those fortuitous circumstances which regularly affect all production. And as regards the famous long-stapled cotton of the islands of South Carolina and Georgia, the above inference is still more forcibly and emphatically correct. The produce of inland districts is, in respect of quality, coarser and shorter in the staple than that nurtured by the sea-side. What is technically termed the Georgia Upland is of this description, and is accordingly adapted for spinning into stout yarns only. In proportion to their distance from the briny deep, the cotton-fields suffer abatement in reference to the quality of their yield. Twenty-five miles is the maximum limit, beyond which the character of the wool undergoes a marked deterioration. The finest seeds are therefore sown within this range, and perhaps the finest of all fructify on the small islands of Edisto, Wadmalan, and St. Helena, which fringe a portion of the Carolinian sea-board. The process of cultivation in lands and latitudes suited to the plant is neither costly nor difficult, but in the states of North America it is attended with considerable risk, and requires frequent and vigilant interference. In the two states to which I have so often alluded, the caterpillar is computed to devour the leaves once in every seven years, when, of course, the destruction of the crop is inevitable. There are worms, too, equally prejudical to the health of the plant, and in their depredations almost equally disastrous. Then rains and winds, which in these latitudes are excessively violent, inflict their share of mischief upon the ill-fated victim; so that, casting out of the account all floricultural sentimentalism for the plant itself, the grower must contrive for his own peace as best he may, and, in order to do so effectually, keep a sharp look-out, a book calculated upon these probabilities of evil, a temper proof against deferred profits, and a willingness to be written down by creditors among the bad and doubtful debts.

Albeit my intention is far from writing a practical treatise on the rearing of cotton, a few facts connected with the subject, conveyed in a few words, may be of some general interest. The quantity of seed sown to an acre is, on an average, about half a bushel. The first material care falling on the cultivator, after the plant has attained a certain amount of strength and elevation, is the joint operation of hoeing and cleaning. This latter consists in freeing it from grass and weeds, the spontaneous growth of which is generally rapid, and its effects so noxious that it must be dealt with by a summary process of ejectment or extirpation. This takes place between April and June. Then comes thinning, which involves toil and judgment, and is likewise performed chiefly during the act of hoeing. When the boles crack, which they do with a loud explosive noise, very appreciable by the ear, it is a signal that the season for plucking the fleecy treasure has arrived. This gathering the crop, which is also a work of time, delicacy and patience, peculiarly well adapted to the minute instrumentality of a child's hand, commences about the middle of August, and is brought to completion with the month of November. As the value of the wool depends very mainly upon the cleaning or ginning, great attention should be given to this important operation, which is so differently accomplished on different estates, that it is often a principal cause of the variation in price of the same description of produce. It is thought that if the Egyptian cotton were thoroughly well ginned, and thus freed from the gross impurities with which it is commonly mixed, it would approach nearer in value to the genuine Sea Island than any other sort imported; but with the present imperfections in cleaning prevalent in Egypt, the innate quality of the material, which is excellent, undergoes a false and unnecessary deterioration. Of wool in this clean condition five hundred weight is the average yield of four acres of plantation.

As there have been great benefactors to the spinning and weaving departments of the economy of cotton, so now and then men of ingenuity and enterprise have sprung up meriting in the estimation of the planters the highest praise and the deepest gratitude, men whose head-work has served to mitigate bodily toil and appease mental anxieties, and whose cunning inventions, though less brilliant than those begotten of the special necessities of the manufacturer, have greatly facilitated production and multiplied its pecuniary returns. The difficulty which has occupied so much attention has been that of freeing the silky fibres within the pod from the husks, seeds, and other foreign substances with which they get encumbered. The names of Harvie, Eli Whitney, and Joseph Eubank, distinguished in connection with this and kindred objects, sound as

sweetly in the ears of the growers of cotton wool as do those of Hargreaves, Cartwright, Crompton and Arkwright, in the ears of its manipulators. Though the ginner's is usually a distinct calling from the planter's, the intimacy of their relationship is such as to give the same melody and the same fragrance to the eulogiums conferred by either. But while the Arkwrights and their spinning-frames are elements in the affairs of the manufacturers, the producers and cleaners stick to the Whitneys and their ginning devices. In preparation for transmission to England the cotton after ginning is tightly packed in bags. In this state it arrives at the port of Liverpool, and is immediately warehoused by the brokers, a class of middlemen, whose business it is to negotiate sales to the manufacturers of Manchester. Once deposited at the factory, the reception it meets with begins with a sound thrashing. After beating it out, it is more carefully cleaned by an instrument known as the Scutcher. Then—to pursue its treatment under the hands of the manufacturer—it is carded, the effect of which, without staying to examine the details of the operation, is to abstract the shorter fibres and arrange those of uniform length which remain, in united parallels, upon which much of the success of subsequent manipulations depends. In this state the cotton now called "sliver," undergoes a drawing process, and is afterwards still further attenuated, and at the same time slightly twisted by the "roving" or "slubbing" machine, when at last it is ready for spinning into yarn, through the agency of the mule for weft, and that of the throstle for twist. Weaving which so wonderfully conjoins in close and compact intimacy these filamentous creations of the spinning-frame, consists of twist for the warp, or lengthway, of the cloth, and weft for the thread with which this is traversed—a strange and better sort of playing at cross purposes, the issue of which is the strength of union. This weaving into piece goods as the diversities of cloth are styled, can be performed either by the hand or the power-loom, though it is needless to say in these days of Archimedean genius the latter is practically by far the more common alternative. After the web has been thus constructed, bleaching succeeds; after bleaching, dyeing; and upon dyeing follows printing; a description of which to be at all intelligible, or to do justice to so curious and elaborate a subject, would involve more time and space than either the reader or myself would deem allowable.

And now for a brief inspection into some of the chief marvels which from time to time have sprung up in aid of the cotton manufacture. I am not going to enumerate any large proportion of them, for their number is indeed legion.

Since 1800, no fewer than 1,440 patents, or thereabout, have been taken out, to say nothing of the standard inventions of our venerable fathers of spinning and weaving some years previously. Upon the principle, therefore, that every little helps, we may infer that by this time the several arts included in this complex branch of industry have attained to a considerable amount of perfection. It will be all that is required for the present purpose to touch lightly upon the most conspicuous and notable of these discoveries, and to exhibit their agglomerated results, as seen in the present condition of this great national pursuit.

A PRIMA DONNA.

The old King's Theatre in the Haymarket was destroyed by fire on the 17th of June, 1789. The singers were engaged in a night rehearsal: for the performances of the following evening were intended to be devoted to the benefit of Signor Ravelli, the acting manager of the then proprietor, Mr. William Taylor. The fire began a few minutes before ten o'clock, and spread almost instantaneously throughout the building. In a few hours the roof had fallen in, and the theatre was totally destroyed. Madame Ravelli, a chief singer, was saved by the daring of the firemen at the risk of their own lives. Pietro Carnivalli, an Italian, dying at Bristol a year afterwards, confessed on his death-bed that he had set the building on fire in revenge for some neglect on the part of Ravelli, who was said to have been a monk in Spain, and was known by the name of Don Antonio. Carnivalli was leader of the band, and his wife had been a singer at the King's Theatre.

A new theatre—the present edifice now known as Her Majesty's Theatre—was built during 1790, the first stone being laid by the Earl of Buckingham, Michael Novosielski being the architect. The internal arrangements, however, received their present form in 1799, when much remodelling and many improvements were made under the auspices of Signor Marinari, an ingenious architect and scene painter. The new opera house opened on the 26th of March, 1791; but the entertainments consisted in the first instance of music and dancing simply, as no licence for performances of a dramatic character could be obtained on the ground that the theatre at the Pantheon in Oxford Street already held such a privilege, and that one Italian opera-house was sufficient. The history of Italian opera in England is a catalogue of rival managements, insolvencies, and fires. Each theatre was styled the "King's," and both struggled on in a ruinous opposition, one with a licence and the other without. In 1792, however, the antagonism ended. The Pantheon was burnt to the ground on the 14th of January in that year, and the fire was attributed to the act of an incendiary. The King's Theatre in the Haymarket obtained its licence under certain conditions, one of these being that a sum of 30,000*l.* should be paid to the lessee of the Pantheon to compensate in a measure for his losses; and for a long time Italian opera in England could be heard nowhere but at Michael Novosielski's house in the Haymarket.

It was at this theatre, on Tuesday, the 8th of April, 1834, that a young lady made her first appearance in England in the character of *Ninetta*, the heroine of Rossini's opera "La Gazza Ladra." Her name was Giulia Grisi. Two years before, a sister of the singer, Giudetta Grisi, had made a successful *début*, on the same boards, in the opera of "La Cenerentola." For her Bellini had composed the music of *Romeo*, in his opera "I Capuletti." She possessed a mezzo-soprano voice of

great beauty, which death was destined too soon to silence. A few years and the name of Guidetta Grisi passes out of opera annals—but the name of Giulia Grisi remains.

She was born at Milan on the 22nd of May, the fête of Santa Giulia, 1812. She was the niece of Josephine Grassini, an Italian singer of the grand old world school, a contemporary of Marchesi, Crescentini, and other great vocalists. The father of Giulia Grisi was an officer of engineers in the army of Napoleon. He had placed his child at a convent at Gorizia for her education. But the example of Giudetta prima donna at the theatre of Bologna tempted Giulia. She had been noted in childhood for a strange hoarseness of voice: this cleared away, however, in time, and left unveiled an organ of singular power and purity, but it was of a low register, the piercing soprano notes with which audiences were subsequently to be charmed were not yet acquired. Giulia Grisi first appeared on *any* stage in the contralto part of *Emma*, in Rossini's opera of "Zelmira." For Rossini ruled in musical Italy in those days. The singer was then seventeen, with a face and figure of extreme beauty. She appeared afterwards at Florence, as *Juliet* to the *Romeo* of her sister. Was it wonderful that she created an extraordinary sensation? At least Shakspeare's heroine can never have been so well looked as by Giulia Grisi at seventeen. At Milan she first met and took for her model the great Pasta, and when Bellini composed *Norma* for Pasta, he also composed *Adalgisa* for Grisi. Such a *Norma* and such an *Adalgisa* can never since have been seen together on the boards of an opera-house.

The new *Ninetta* had a great success in London. Certainly she did not shine from the dulness of her fellow-labourers, for the cast of "La Gazza Ladra" in 1834 included the names of Rubini, Zuchelli, Tamburini, and Miss Bartolozzi. It was a genuine triumph. *Ninetta* thoroughly won her audience, and from 1834 down to 1861 inclusively (with the exception of one year, 1842, when there was some difficulty with the *impresario*, and the lady tore up her contract and declined to sing in England that season) the prima donna par excellence of Italian opera has been Giulia Grisi. Nor was her first public a public to be so very easily pleased. It had still the tones of Pasta, Cinti-Damoureau, Henrietta Sontag, De Meric and Malibran-Garcia ringing in its ears when it first applauded the new singer. But her merits were undeniable, and the chief characters in the *répertoire* were ceded to her as a matter of course.

During the month of April, 1834, Giulia Grisi appeared (in addition to the character of *Ninetta*) in the operas of "Anna Bolena," the ugly Russian tenor with the beautiful voice, Ivanoff, making his first appearance in England as *Percy*, "Otello" and "Don Giovanni," (Madame Caradori being the *Zerlina*). During May she added to the list *Elena* in "La Donna del Lago," and *Rosina* in "Il Barbiere." In June she first appeared as *Semiramide*, and as *Palmira* in Rossini's "L'Assedio di Corinto," played for the first time in England. On the occasion of her benefit on the 10th July she appeared as *Amina* in "La Sonnambula." In the season of 1835 she appeared as *Elena* in "Donizetti's Marino Faliero," and *Elvira* in "I Puritani," both operas being then produced for the first time in England, and the last-named being played for her benefit. She undertook also the new parts of *Fiorilla* in Gnecco's "Prova d'un Opera Seria," and of *Norma*, which character she first assumed on the 25th June. The triumphant representations of the preceding season were of course repeated. In 1836 the lady's only new part was that of *Amelia* in Mercadante's opera "I Briganti," played for the first time in England. The season of 1837 presents too or three noteworthy facts. The King's Theatre became Her Majesty's Theatre. William the Fourth died on Tuesday, the 20th June—of course there was no performance at the Opera House in the evening. Queen Victoria visited the opera for the first time on the 18th of July, when "Ildegonda," by Marliani, was produced, Madame Grisi performing the heroine. The opera gave no great satisfaction, and has not been repeated since the season of 1837. On the 18th of May Signor Costa's opera of "Malek Adel" was first played, Madame Grisi being the *Mathilde*, assisted by Madame Albertazzi (who this season made her *début* in England in "La Cenerentola,") Ivanoff, Rubini, Lablache, and Tamburini. The opera was repeated the following year, and portions of it were given in 1842, during our prima donna's absence from England, when Madame Persiani undertook the *rôle* of heroine. In 1837 Madame Grisi also added to her *répertoire* the part of *Carolina* in Cimarosa's "Matrimonio Segreto." Her new characters in 1838 were *Parisina*, in Donizetti's opera of that name; *Susanna*, in Mozart's opera "Nozze di Figaro;" and *Mrs. Ford* in Balfe's "Falstaff." In this year Madame Persiani first appeared in England. The following year gave Madame Grisi only one new part, but it was one that has done more to enhance her reputation than almost any other. On the occasion of her benefit on the 6th of June, 1839, Donizetti's opera of "Lucrezia Borgia" was played for the first time in England, Madame Grisi, of course, being the *Lucrezia*, and Signor Mario making his first appearance before an English audience as *Gennaro*. Among the other events of the season may be noted the *début* in this country of Madame Viardot, as *Desdemona*; and the first appearance of Madlle. Ernesta Grisi, who played the contralto part of *Smeaton* to the *Anna Bolena* of her cousin. Opera-goers will recollect the season of 1840 as being the season of the "Tamburini Row," when the indignant pit compelled the *impresario* to re-engage their favourite baritone at any price, and refused to accept the very good singer who had been secured as a substitute—Signor Coletti, who made his first appearance in Donizetti's "Torquato Tasso." Our prima donna this year played for the first time *Lisetta*, in "Il Matrimonio Segreto," and *Eloisa* on the production of Mercadante's "Il Giuramento." In 1841 Madame Grisi undertook two new characters in operas, both played for the first time in England, and both by Donizetti: *Fausta* and *Roberto Devereux*. During the whole of the next season Madame Grisi did not appear. The chief parts in her *répertoire* were shared amongst

Mesdames Poggi-Frezzolini, Moltini, Persiani, and Ronconi—Signor Georgio Ronconi appearing in England for the first time. 1843 is noticeable in operatic annals for the production of "Don Pasquale" (Donizetti), in which Madame Grisi played *Norina*, and, assisted by Mario, Fornasari, and Lablache, achieved an extraordinary success. Fornasari this year made his first appearance in England, the opera chosen for his *début* being Donizetti's "Belisario." Towards the close of the season, Madame Grisi appeared as the heroine of the "Cenerentola." In 1844 her new *rôles* were *Isabella* in Signor Costa's "Don Carlos," and *Delizia* in Ricci's "Corado d'Altamura," both operas being new. Her only new part in 1845 was *Imogene*, in Bellini's "Il Pirata;" in 1846, *Griselda*, in Verdi's "I Lombardi." Our singer's connection with Italian opera at Her Majesty's Theatre was then finally closed.

The old opposition between the Pantheon and the King's Theatre was now to be revived in the rivalry of Her Majesty's and Covent Garden Theatres. With few exceptions the whole of the *troupe*, orchestra, and chorus, quitted the old theatre for the new. It was not an insurrection, it was a revolution. John Kemble's Covent Garden was altered into an Opera House—so new-shaped that its identity seemed quite lost. A new era opened for Italian opera in England. Under the old system operas had been "pitch-forked" on to the stage—a star system had prevailed—*ensemble* had been completely neglected. Dingy scenery, shabby and anachronistic costumes, an inefficient chorus, and a scanty orchestra had aided a small constellation of eminent singers to maintain Italian Opera at the King's Theatre for the entertainment of a *clique*, not for the pleasure of a public. This was to be changed. The new undertaking promised perfection in every thing. Art was to be considered as well as the artist—the composer as well as the singer. A catholicity of appreciation was to rule the choice of operas. The music of all nations was to be included in the *répertoire*, while Italian was retained as the special language of song. Upon the whole the managers of the new undertaking acted up to the spirit of their promises, although success did not very immediately crown their exertions. An enormous expenditure was required for the firm planting of the opposition project. But it was founded on sound principles, and triumphed in the end. Even the fate of the Pantheon could not crush the enterprise. Covent Garden burnt to the ground in 1856, the manager carried his *troupe* to the smaller Lyceum Theatre. In 1858 the Royal Italian Opera was thriving in a new and splendid theatre—New Covent Garden. At this moment we are probably justified in saying that Italian Opera is remunerative to those concerned in its production, even on a scale of magnificence without precedent, in theatrical history. This success has been dearly bought, but it has been certainly deserved. One of its consequences has been the ruin of the elder undertaking. There would seem now to be almost as little chance of hearing Italian music again in the King's Theatre, in the Haymarket, as in the Pantheon in Oxford Street.

Madame Grisi appeared on the first night of Italian Opera at Covent Garden. Her *Semiramide* was supported by the *Assur* of her old colleague—Tamburini, and Madame Alboni, a singer who, for beauty of voice and executive ability can hardly have been equalled, made her *début* in England as *Arsace*. The season of 1847 may be remembered also as the "Jenny Lind" year. It is not unfair to say now that the merits of the Swedish Nightingale hardly justified the popular excitement that followed her performances. She was a great singer of small parts,—her ventures out of a limited line of characters were distinct failures. An admirable vocalist, but without versatility; still the most charming *Alice* and *nearly* the best *Amina* (for is not Malibran remembered? and Patti now singing?) that have ever been heard. The Lind mania supported Her Majesty's Theatre under an opposition that must otherwise have crushed it. Madame Grisi's only new part in 1847, was *Lucrezia*, in Verdi's "I due Foscari." In 1848 she played, for the first time, *Leonora* in Donizetti's "Favorita," and succeeded in obtaining public approval of an opera that had, until then, been rather undervalued. This work, composed for the Grand Opera at Paris led the way to the performance of other fine works, more especially associated with the French lyric stage. Meyerbeer's "Les Huguenots" was produced for the first time on the occasion of the Queen's state visit in 1848, Madame Viardot being the *Valentine*. In the following year Madame Grisi assumed the part, and equalled in power and sentiment, while she surpassed in beauty, the delineation of her formidable rival. The character has since remained one of the most admired of Madame Grisi's list. The season was also memorable for the retirement of Madame Persiani. In 1850 our singer appeared for the first time, and with singular success, in the part of *Alice*, in Meyerbeer's "Robert le Diable," the opera being produced with extraordinary splendour. In 1851 her new character was *Pamina* in "Il Flauto Magico." The following season was notable as being one of extreme antagonism between the rival houses. A contest between the managers, in regard to a singer, famed throughout Germany for her representation of *Fides* in Meyerbeer's "Prophète," was determined in the Court of Chancery, and the lady was forbidden to appear on the stage of Covent Garden Theatre. A subsequent season demonstrated that the merits of the German *Fides* hardly warranted the hostility that had risen on her account. To meet the popular demand for the performance of the opera in 1852, notwithstanding the loss of the proposed *Fides*, Madame Grisi courageously offered to undertake the part. Though much of the music was of an exceptional character, and hardly came fairly within the means of the singer, the poetry and passion with which the part was invested, joined to the good feeling towards the management and the public which had prompted its assumption, secured an enthusiastic reception of the representation. The performance, indeed, may be regarded altogether as a surprising *tour de force* on the part of our prima donna, and says much for that perpetual youth of true genius, always willing to learn and to venture, to make new effort and to acknowledge no finality. Madame Grisi's successes in French opera, a very distinct field of

art to the music of the Italian stage, considering the period of her career at which they were achieved, are as remarkable as anything in her history. The season of 1853 saw merely a repetition of some of her most favourite performances. In 1854 was committed one of those mistakes which great artists are so constantly making. They begin by saying "Good-bye" too soon, and the danger is that they end by saying the last words of parting a little too late. Farewell performances were announced, and at a farewell benefit—on which a divided performance was given, and the singer sustained one Italian part and one French, the first act of "Norma" being played, followed by three acts of "Les Huguenots"—Madame Grisi took leave of her English public midst a scene of extraordinary excitement: the prices were doubled, the house crowded to excess, the applause was as enthusiastic as it was prolonged. But in 1855 the lady was singing again! The pangs of parting might have been spared. In 1856—the Royal Italian Opera, the scene of her greatest triumphs, destroyed by fire—she was singing at the Lyceum, and again in 1857, where, it may be mentioned, she appeared in yet another new part, that of *Leonora* in Verdi's "Il Trovatore." The years 1858-9-60 have each seen the lady's successes won over again. In the former year she opened New Covent Garden Theatre with her performance of *Valentine*, as in 1847 she had opened John Kemble's altered house with her *Semiramide.* The facts of the farewell season of 1861 are freshly before the reader.

Glance now at a list of the operas in which Madame Grisi has sustained characters, with the number of times she has played in each in London. "La Gazza Ladra," 47; "Anna Bolena," 38; "Otello," 36; "Il Don Giovanni," 82; "La Donna del Lago," 21; "L'Assedio di Corinto," 11; "Semiramide," 41; "Il Barbiere," 38; "La Sonnambula," 18; "Marino Faliero," 8; "I Puritani," 92; "Prova d'un Opera," 21; "Norma," 79; "I Briganti," 5; "Il Matrimonio Segreto" (*Caroline*), 10; "Malek Adel," 7; "Ildegonda," 2; "Parasina," 6; "Nozze di Figaro," 22; "Falstaff," 4; "Lucrezia Borgia," 97; "Il Giuramento," 9; "Il Matrimonio Segreto" (*Lisetta*), 9; "Fausta," 2; "Roberto Devereux," 6; "Don Pasquale," 29; "Cenerentola," 3; "Don Carlos," 5; "Corado d'Altamura," 1; "Il Pirata," 6; "I Lombardi," 11; "I due Foscari," 3; "La Favorita," 26; "Les Huguenots," 78; "Roberto il Diavolo," 12; "Il Flauto Magico," 3; "Le Prophete," 9; "Il Trovatore," 13.

Some 900 and odd nights are thus accounted for, spread over twenty-seven operatic seasons! For so many years has Madame Grisi been singing in London, on an average of about thirty nights a year. There may well be some pain at parting with an artist who represents so large a share in the entertainment of a generation! There need be a fond leave-taking of one, who, apart from being a beautiful woman and a great singer, has toiled so honestly and zealously for her public. Whenever Madame Grisi trod the stage, her audience might be sure of heart-and-soul work for their entertainment. There was no apathy, no caprice, no sluggishness that sometimes seems to weigh down other singers like a heavy cloak. No sparing of self when our prima donna was upon the scene. There has never been a more conscientious public servant. And look over her long list of parts. Is it possible to point to any one living singer as capable of sustaining these as our prima donna sustained them? Some of them, it would seem, must even leave the lyric stage with her. Examine the names of those who have ventured upon, or been forced into her *répertoire*, during the last ten years, say. *Norma* has been played by Jenny Lind, Parodi, Fiorentini, Cruvelli. *Lucrezia Borgia*, by Cruvelli, Parodi, Frezzolini, Barbieri Nini, Albertini, Johanna Wagner, Titiens. *Donna Anna* has had for representatives, Castellan, Viardot, Parodi, Fiorentini, Medori, Cruvelli, Rudersdorff, Rosa Devries, Spezia, Titiens. As *Elvira* in "I Puritani," Castellan, Lind, Frezzolini, Sontag, Bosio, La Grange, Parepa, Ortolani, Penco, have appeared. Which of these vocalists has torn a leaf from Madame Grisi's laurels? Which has in any way diminished her identity in the public mind with these characters? No, at her theatrical demise her mantle must be divided amongst many; there is no one entitled to it in its integrity. Some characters will fall as of right to Viardot, some to Titiens, to Penco, to Carvalho; much of her younger *répertoire* to Patti; but there is no one who can establish a claim to all of them.

The *habitués* of the opera must seek what consolation they may. They will look a long while for a successor to their prima donna who will cause her to be forgotten. For few can hope to unite her gifts from nature and art. London knows no living singer who can so possess her audience as Madame Grisi possessed them. Who can so awe and win, who can so startle by her passion, and charm by her *espièglerie*; can be so great in tragedy, so graceful in comedy. And she has sung for twenty-seven seasons in London! Is she to be blamed that she was loth to part from her patrons? And on the whole Time has been kind. They who took leave of a great artist in 1854, found they were still saying good-bye to a great artist in 1861. It was the same Giulia Grisi, of the beautiful face, of the silver voice, of the perfect art.

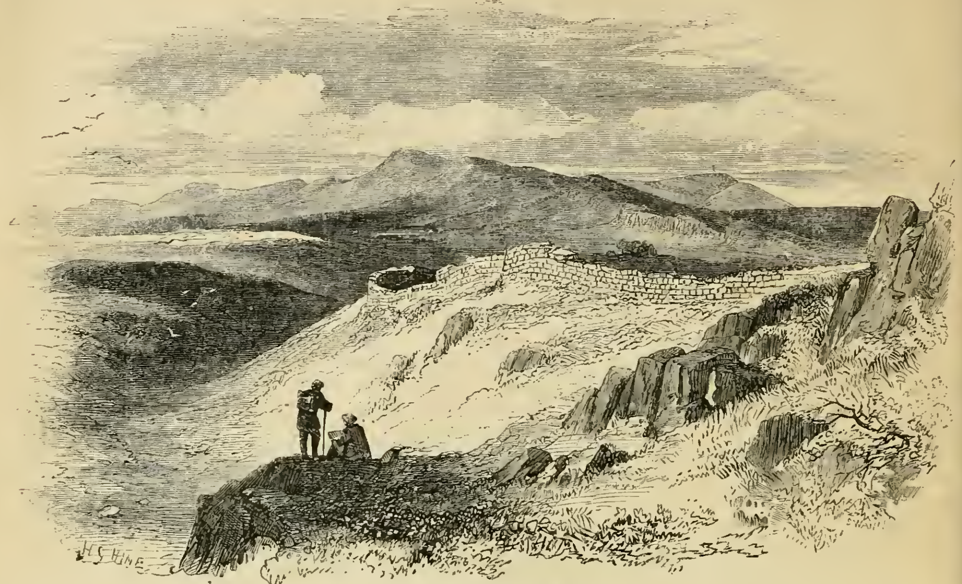
Dutton Cook.

AN ARTIST'S RAMBLE ALONG THE LINE OF THE PICTS' WALL.

PART III.

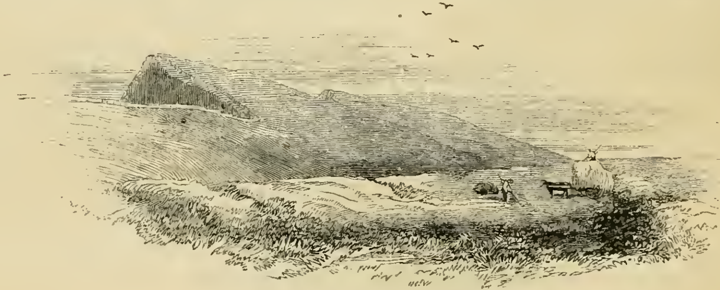
Taking up the thread of the wall at Milking Gap, we continued till we reached Steel-rig Gap, where, on the steep descent of the hill, our attention was attracted by the manner in which the courses of wall stones are stepped horizontally into the face of the ground. Hence the wall climbs a bold eminence, running along the verge of the cliff until it reaches Castle Nick, where the military way appears in very perfect condition, with the kerb-stones complete on either side. Passing another gap called Cat's Stairs, we reached Peel Crag, where the face of the cliff rises in a lofty perpendicular wall of basalt, and Gap in the Wall, where a double ditch, in addition to the fosse, testifies that at this point the barrier was considered to require an extraordinary amount of

strength. The next elevation is Winshield's Crag, estimated to be the highest ground between the two seas: from its summit the sails of vessels



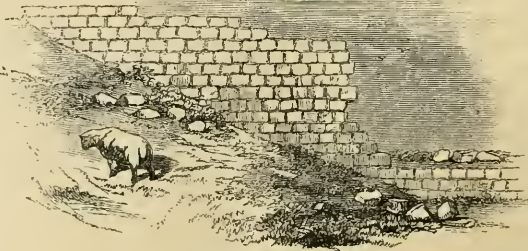
The Wall near Haltwhistle.

upon the distant Solway may be perceived on a clear day; but the gathering shades of evening



The Vallum and Wall, Cawfield Crags.

denied us this gratification, and we quickened our steps in anticipation of the tea and its accompaniments which we knew our good hostess of the Crown would not fail to set before us on our arrival.* Still proceeding westward, the last red ray of the sun glanced appropriately enough upon the Nick to which Dr. Bruce — who has well and truly entitled himself to stand sponsor to any hitherto unnamed portion of the Wall—has thought fit, in remembrance of the following circumstance, to endow with the ominous cognomen of Bloody Gap. North of the gap is a ridge of ground called Scotch Coulthard. When fugitive moss troopers reached this point, their escape was considered secure, for all beyond is waste and swire, where only they could find footing. Here then, between the Wall and Scotch Coulthard, was the place where, if the fugitive could not make his heels, or rather the sturdy legs of his shaggy Scotch nag, save his head, he must turn at bay; and that many a fierce encounter has here been waged is evident from the numerous skeletons turned up wherever the ground is broken for drainage operations. Further on we came to another gap, whose ominous title of Bogle Hole seemed invested with additional horror as the



Portion of the Wall at Walltown.

* Peremptory in her kindness, mine hostess would say, when I have arrived in the evening wet with roaming among the mosslands, or drenched by a shower, "Sir, your tea is ready, and shall be served as soon as you are dry and comfortable, but until you have changed every wet stitch, not a bit nor a sup will you get from me."

twilight deepened into the shadows of night, and we hastened our steps to the next, Caw Gap, whence we turned towards the descent of the steep road that conducted us back to Haltwhistle.

While descending to Haltwhistle, W—— recited a passage from Procopius, a somewhat obscure author who is believed to have written in the fifth century, setting forth the notions entertained in his day regarding the outlying ground to the northward of the Wall. "Moreover, in this Isle of Britain," he says, "men of ancient time built a long wall, cutting off a great portion of it, for the soil, and the men, and all other things, are not alike on both sides; for on the eastern (southern) side of the wall there is a wholesomeness of air in conformity with the seasons—moderately warm in summer and cool in winter. Many men inhabit here, living much as other men. The trees, with their appropriate fruits, flourish in season, and their corn lands are as productive as others, and the district appears sufficiently fertilised by streams. But on the western (northern) side all is different, insomuch, indeed, that it would be impossible for a man to live there, even half an hour. Vipers and serpents innumerable, with all other kinds of wild beasts, infest that place; and, what is most strange, the natives affirm, that if any one passed the wall he would die immediately, unable to endure the unwholesomeness of the atmosphere. Death also attacking such beasts as go thither, forthwith destroys them. . . . . They say that the souls of men departed are always conducted to this place, but in what manner I will explain immediately, having frequently heard it from men of that region, relating it most seriously, although I would rather ascribe their asseverations to a certain dreamy faculty which possesses them." The people of the district still have their stories of "bogles and lang nebit things fra' the neist warld" of flying men and of dogs in full pursuit, being scared back by some strange metamorphosis of the quarry.

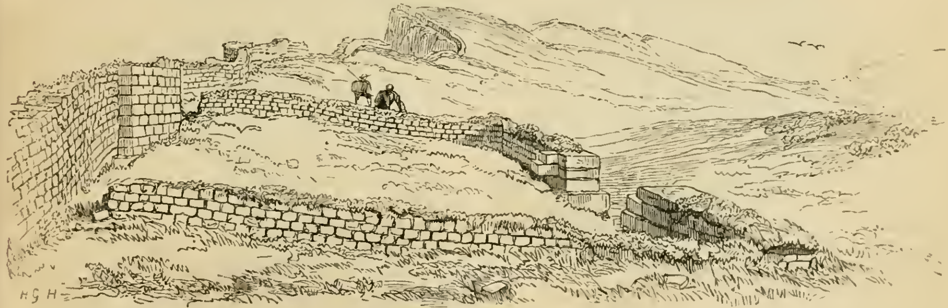
Next morning we sallied forth, W—— undertaking to accompany us part of the way, and took up the line of our march at Caw Gap, where we quitted it on the preceding evening. A road, which soon dwindles to a mere track, runs hence to the north. It passes a lone, uninhabited house, reputed to be haunted by the unquiet spirits of Nell Nichol and her two wicked daughters, who, in their lifetime, were the plague of the neighbourhood. The house was a notorious resort of smugglers and sheep-stealers. Passing another gap, called Thorny Doors, we reached a stage of the Wall, the base of which having been cleared, appears in all its original sharpness, the tooling of the stones looking as if fresh from the Roman hammer. The mile castle called the Cawfields Castle, which we presently reached, is the most perfect structure of that description remaining. The gap which it defended is denominated the Pilgrim's Gap, having been so named by Dr. Bruce's party, who walked along the line of the wall in 1849. The castle is a parallelogram, the corners at the southern side being slightly rounded off. Its inside measurement is sixty-three feet from east to west, and forty-nine from north to south. The south gateway is composed of massive slabs of rustic masonry, and a corresponding gateway appears, walled up, on the northern side, through the wall on which the castle abuts, and opens directly on the face of the crag. These gates have been closed by double folding doorways. The pivot holes are worn by the action of the bolt, which has tinged them with oxide of iron. The opening at each gateway measures ten feet. The width of the wall at the southern gateway is nine feet three inches; at the northern it is ten feet six inches. The castle stands on a slope of about one foot in five, and toward the lower side a level has been obtained by means of "made earth." In clearing out the area, some tiles of grey slate, pierced for roofing, were found, these, it is to be presumed, had been used for the side coverings, the central part of the building being open. In one place the wall is calcined by fire, where, it is likely, the hearth was placed. Here, sheltered from the wintry blast, crouching over the embers, some old legionary grumbler might have appropriately repeated the lines of the poet Florus:

> Cæsar himself I would not be,
> Were the choice e'er imposed on me,
> To march on foot through British foes,
> And bear their Scythian frosts and snows.

And, near at hand, fragments of coarse earthenware and millstones formed of lava, with a sprinkling of oyster shells, betokened the important business of cookery and the consumption of those

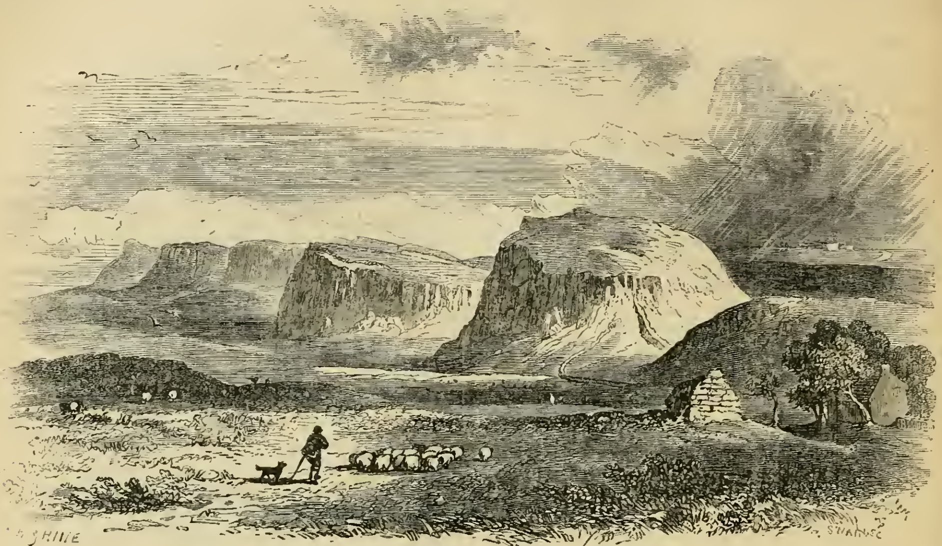
> Wonderful oysters which
> The Caledonian tide sometimes throws up,

celebrated by the poet Ausonius.



Mile Castle at Cawfield Crags.

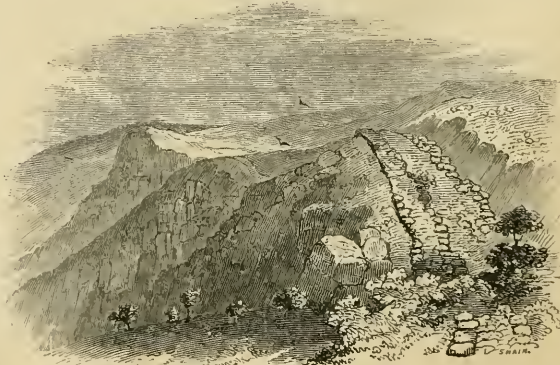
The Cawfields Mile Castle is an exception to the general plan of those structures, in the opening of a gateway to the north, and the question naturally suggests itself, Why open a door on the hostile side of the castle? As an exceptional instance, it would appear to have been planned with a specific



Military Road at the Wall near Cawfield Crags.

object. This portal opens almost directly on to the edge of the crag, which is precipitous, but not incapable of ascent or descent, so that it was assailable from the north; and, in like manner, a sally in that direction could have been effected, although under very disadvantageous circumstances, the balance of advantage being much in favour of the enemy, who would only be induced to make the ascent under the concealment of a night attack. I can only conjecture that perhaps the gateway may have been planned for the purpose of communication with an outpost which had been planted to the north of the wall, or for the exit and entrance of a foraging party.

Leaving this interesting vestige, which lies about midway between the two seas, we made our way to Great Chesters—Æsica—the tenth stationary camp. This comprehends an area of about three acres. In the centre of the camp is a vaulted apartment, similar to that at Walwick Chesters, six feet and a half square and five feet high. It is accessible by a descent of steps, and opposite to the entrance is a stone bench covered with a slab of stone about two feet and a half high and the same in breadth. The vaulted roof consists of six ribbed arches, and the floor is paved with large slabs of stone. According to the Notitia, Æsica was garrisoned by the *Cohors Prima Astorum.* The name of Æsica is traced to a Celtic word signifying water, and may have had its origin in allusion to a watercourse which has been carried to it at a length of six miles from a body of water called the Saughy-rig Washpool, and which, it has been surmised, was planned to add to the strength of the camp by the further security of a wet ditch or moat.



The Wall at Walltown Crags.

To the west of Æsica the crags reappear, and again the wall, like Sisyphus of old, rolls its burden up-hill; and, following its lead, we stood on Mucklebank Crag, whence we looked over the wastes of Cumberland to Crossfel and Skiddaw, and, as we took them to be, the peaks of Arran in the extreme distance to the west. We next reached the Walltown, a solitary house which has some features of a peele tower. It formerly belonged to John Ridley, the brother of the Oxford Martyr. Near this house our comrade W—— directed our notice to abundant patches of chives which grow in the crevices of the whinstone rock, and are said by people of those parts to have been originally planted there by the Romans.

J. W. Archer.

THE SILVER CORD.

BY SHIRLEY BROOKS.

CHAPTER XCIV.

WHILE Laura was in the close embrace of her children, her husband silently left the room, casting upon the loving group an earnest glance which did not escape the vigilant eye of Beatrice.

He made a sign to Charles Hawkesley to follow him. But it was Beatrice who came out and closed the door.

"Come with me," she said to Arthur.

He followed her to the drawing-room.

"You wish to speak to Charles," she said, "but it is far better that you should speak to me, Arthur. Already there is coldness between you and him, and you are both falling back upon your pride and dignity, and five minutes more may separate you for life. You cannot quarrel with me, Arthur, and you cannot offend me. Speak to *me*."

"I had but little to say to him, Beatrice, and that little was simply matter of business. But I will write."

"Write! About what?"

"About future arrangements."

"Arrangements. What is a man's nature? He has still in his eyes the image of his children clinging round the neck of their mother, who is crying out her poor heart between happiness, and doubt, and misery, and he walks from the room and talks of arrangements. Do you ever love us, Arthur? Do you know what it is to love us?"

"Let me write to Charles, Beatrice," said Lygon, in a troubled voice, "and let me go."

"I will not try to stop you. If what you have just seen cannot do that, my words will be of little avail. Yes, dear Arthur, tell me that you called Charles to bid him draw the children away, and send her in here to you, for one moment, for one moment. O, Arthur, make us happy, make *her* happy, and God bless you for ever."

"There is no happiness but in truth and trust," said Arthur Lygon. "Sobs and tears are but hollow substitutes for those. When the sobs are hushed and the tears are dry, then begins again the doubt and the hypocrisy. I will not doom myself to such a life. Farewell, Beatrice, it may be long before we meet again, but be sure that I shall never forget your affection. Farewell."

She detained him by the hand he had placed in hers.

"It is so. Yourself," she said, almost bitterly. "You think of no one but yourself. This selfishness is fearful—yes, and it is contemptible, too."

"Beatrice!"

"I tell you that you cannot quarrel with *me*. I can stand before you and charge you with contemptible cowardice, and you cannot strike me—you cannot even insult me in return. Yes, I have the advantage, and I use it. Arthur, the time of your own trial has come, and you prove unworthy. Poor Laura!"

"I can only be silent, Beatrice, and leave you."

"Your tongue may be silent, but your heart, such as it is, owns that I am speaking the truth. And when you have gone away, and the flush of anger is over, you will accuse yourself in the very words I have spoken. Do not forget them, Arthur. I have said that you are a coward."

"I will forget all, except that a sister made a last and desperate effort on behalf of her sister—to preserve that sister in her position in the world."

"Arthur," exclaimed Beatrice, passionately, "such bitter words were on my lips—they shall not be spoken—no, thank God, I have mastered myself—there. But you are very wicked."

"Be it so, and let me go."

"Her position in the world! There is one position in this world, and but one for which Laura cares, and for which at this moment she would joyfully give twenty years of a life that ought to be too happy for her willingly to shorten it. That, and all the world could offer, she would give to find her head on your breast, and to hear you whisper her name. You know it, you are owning it to your God at this moment, and you are too cowardly to open that door, and with one word bring a happy creature to your arms."

"Why do you harp on the most offensive word you can find?" said Arthur, angrily.

"Because it is the truest. Even while you speak you are proving it. You are striving to close your heart against me, and fastening on that word."

"Cowardly!" repeated Arthur, slowly.

"Yes. You are afraid of yourself. You, who have been proud, and have had a right to be proud of your calm, silent courage, who have shown yourself too really brave to be foolishly impetuous, who have faced the troubles and trials of years, and have conquered them all, you are now afraid of yourself, and of your own thoughts. I read your heart, Arthur, as if it were my own, and I almost hate you for a meanness that will send Laura to her grave."

"I must not answer you."

"O, if you could, we should all be so happy! But you cannot."

"In part you are right, Beatrice, and it is painful to me to own that you are right, because that accuses one of whom I wish to speak only with kindness. I see my course before me; I have convinced myself that it is just, and I should indeed feel ashamed hereafter, if my conscience could tell me that I weakly gave way. That is cowardice of which I own I am guilty."

"What weak, miserable, stilted words! and yet they are the right ones, Arthur, for uttering a miserable pretence. If we are never to meet again, do not let us part with a falsehood between us—a cruel, shallow falsehood."

"*You* have heard none."

"Do not say so. Dear Arthur, you talk of justice; be just to yourself, and to us all. It is of no such mocking folly that you are afraid. It is of your own nature. You are proud, sensitive, and you have learned to be suspicious—there, do not speak—I know what you would answer to that word."

"That the lesson has been wantonly forced on me," said Arthur, sternly. "It was none of my seeking—suspicion was no part of the nature which you describe so vindictively, Beatrice. Ask Laura. Her goings-out and her comings-in were uncontrolled by me; her friends, her letters, her secrets were her own. I had made her my wife, and in that word was absolute, unquestioning faith. Suddenly a whole history of treachery is thrust before my eyes, and *that* image, Beatrice, will outlive all others."

"Yes, you speak the truth, now," said Beatrice, sadly.

"And what are you asking, or what is she stooping to ask through you? That a husband who loved her better than life, and believed her worthy of his love, and who can say, as if he were speaking his last words, that never for one waking hour of their married life was she absent from his mind, and who never let a day pass without some act, it might be a trifle, it might be more, for her comfort, or her amusement—you are asking that this husband, alienated by her own deceit, shall affect to receive her home as he would have welcomed her from some holiday, and shall pretend to re-people his home and his heart with all the loving thoughts of old days, with all that she swept remorselessly away in an endeavour to conceal her treachery. This Beatrice Hawkesley stoops to ask of me, that her sister may continue to live in her husband's house, and go out into the world under the protection of his name. You scoff at a man's pride, Beatrice, but what is a woman's?"

"Her love, which, Arthur, you have never comprehended—and which, I judge from your words, you never will comprehend. For the sake of that deep, true love of Laura's, I can bear with your language, wounding as it is, and as it is intended to be. Yes, we stoop to ask what you have said we ask. We accept this at your hands, and not sullenly, Arthur, but with humble gratitude, and we will wait for the day when you shall thank those who accepted your grudged and contemptuous pity. Even on those terms, Arthur, and with such low thoughts on your part of the motives that lead us, I beg you to receive back my sister to your home."

"I scarcely believe that I hear the voice of Beatrice Hawkesley," said Arthur, speaking low.

"No," said Beatrice, "you hear the voice of your wife. I speak at her bidding, and, if you will, believe her at your knees asking what I have asked in her name."

"Beatrice, the time is too solemn for trifling.

I have known you as a high-minded and truthful woman. I hold your husband responsible for the truth of what you say to me."

"He will accept the responsibility."

"And if I ask you, in the name of all that you hold sacred—"

"In the most sacred name of all, if you will."

"If I ask you whether this appeal is made to me at Laura's prayer—whether she desires, without one more word of the past, to return to my house and resume her place there—you hear me, without one word of the past,—if I ask you *that*, Beatrice?"

"I answer you, Yes."

"Remember what I have said—remember it now and for ever, Beatrice."

"Until you bid me forget it."

"I hear," said Arthur, in an agitated voice, "what, an hour ago, no earthly persuasion could have made me believe would have been uttered by living lips."

"And there has been a time, this very day, Arthur, when I believed it as impossible. But you have heard me, and you grant the prayer that I have made?"

The voice of Beatrice seemed forced and unmusical, and he looked earnestly at her.

"If I judge rightly, Beatrice, it was not counsel of yours that has impelled my wife to take this course."

"Of mine? No," she answered, slowly. "It was no counsel of mine. I love my husband, dearly, deeply, with all my heart and soul. Perhaps I am wicked to speak of the possibility of an hour that could part us—there is but one, I bless God when I say it, that ever can. But if such an hour had come, I dare not say that, deep and true as is my love for him—well, I might have strength given me for such a trial—but I will not now say that what I have been bidden to ask for Laura I would ask for myself."

"You would not?"

"I dare not say that I would."

"Beatrice, in my turn, let me say that I dare not ask what this abjectness of submission means."

"Means?" repeated Beatrice, piteously.

"Yes, the question comes to me with fearful promptness——"

Beatrice Hawkesley uttered a cry—almost a wild cry—and her hand was upon his lips.

"In the name of God! for the love of your children, wicked, foolish man, be silent! Down with all thoughts but one! Oh, Arthur! down with all devilish thoughts. and pray, pray for the power to understand something of a woman's love. She flings herself before you, she prays you to take her home—she, Laura, the proudest of us all—she begs you to forgive her, and with that head bending before you, and that proud heart stooping for pardon, are you so miserable—Oh, Arthur, it is not, it cannot be so!—are you so unhappy as to be unconvinced of her love? Does the God that gave such a woman to your heart deny you the power of knowing how you are blessed?"

Beatrice's tears came to her relief; but, as she leant upon the arm of Arthur, he felt that her agitation was fearful.

"What am I to say?" he uttered, mechanically.

"Say?" answered Beatrice, in a voice choking with sobs. "Call *her!*"

"Either I am mad," said Arthur, wildly, "or God has kept such a blessing for me as I have never deserved. Which is it, Beatrice?" he exclaimed, passionately, imperatively, as if the decision were with the agitated woman who looked up to him with a glowing face, stained with tears.

"Go to her," sobbed Beatrice.

"I *will!*" he answered.

He turned to the door.

"No, let her come to you."

At least he thought he heard some such words; but there was a woman's voice, and a figure hastily crossing the room, and something of a struggle, as of a wife who sought to kneel, but was indignantly caught up to a husband's bosom, and held strongly there, and all that could be borne in the way of pardon given in a kiss, and that kiss forgotten in a long embrace of love.

He would never have remembered that any such words had come to him, but she murmured a word or two—how long afterwards he knew not, but they were alone in that drawing-room.

"I want to speak—darling—one word—I will speak."

"Not now."

"Yes, now, and never again. Will you ever think me proud any more?"

"Yes."

"Not when I tell you that I was listening at the door. Oh! if you had—"

But the sentence was never finished.

As for Beatrice, she again behaved that night in a way so unworthy of a dignified British matron that I do not altogether like to set down the particulars. The only sort of excuse that can be offered for her is, that all the rest of the party seemed to be almost equally unmindful of the proprieties of life. I pass over the excitement of the children, which was shared, to a certain extent, by their cousins, and the merciful removal of all those household blessings, after various ineffectual attempts, and the restoration of quiet in the apartment in which the Hawkesleys and the Lygons were assembled. That Arthur Lygon should say little was natural, and that Laura, having seated herself upon a footstool beside his knee, should content herself with holding his hand, and studying her wedding-ring (which seemed to have some strange attraction for her eyes, and yet it was but a common guinea affair too), and taking very little notice of anybody, was perhaps also pardonable enough. Charles Hawkesley seemed impressed with the idea that a great deal was expected from him, and that it fell upon him to maintain the conversation of the evening, and with the best possible intentions he started topic upon topic, delivered a speech upon each, and when he had fairly worn it out, took another, and acquitted himself upon that with equal fluency and equal failure to produce the slightest response. He also acted on the same principle in regard to his hospitalities, and brought out bottle after bottle of wine, of all kinds, poured

out glasses thereof, and set them before the others. Nobody tasted any, but this did not discourage Hawkesley, who continued to talk and to bring out wine as if he were actuated by some concealed machinery of a hospitable character, and had been set going for the good of society. But Mrs. Hawkesley made herself perfectly ridiculous. How many times she kissed Laura's forehead, in a straightforward way, and how many times she took advantage of her sister's position to come behind her, and hold her head, or touch her shoulders, or give some similar intimation of satisfaction, I cannot say. This might be forgiven, as also might her standing before Arthur and contemplating him kindly, and then walking right away to her husband, and kissing him in the very middle of a speech about Mr. Gladstone's financial scheme, or the National Gallery, or something that neither he nor any of his audience just then cared one farthing about. But why she should have disappeared, after a time, without assigning a cause, and then should have made her re-appearance, at intervals, each time bringing down either her own baby, in its night-clothes, or Walter, in the garb of a *débardeur*, or Clara in some hastily assumed garment, and slippers, but no stockings, or Freddy, in extreme *déshabillé* (it was hard work to get him away, and he had to be bribed with wine), and then varying the performance by calmly bringing in her own baby again, as if nothing had happened, she has never been able to explain, and Charles Hawkesley teases her to this day upon her perseverance, that night, in rehearsing a sort of private Resurrection of the Nuns by instalments. But nobody seemed surprised, and Laura and Arthur, each holding a hand of any child presented to them, would have held it, I believe, until morning, if Hawkesley had not occasionally taken it away, to make room, as he said, for more novelties which were then getting up.

There had been another watcher that evening, another listener at doors, but one who had watched and listened for another purpose than that of reconciliation.

Irritable, impatient, impenitent Bertha had with difficulty endured the solitude of that day. There had been little thought for her, beyond the kindly orders which Mrs. Hawkesley had given for her comfort, and while the incidents that have been last recorded were passing, she had been left entirely alone. Speedily discovering that there was some unusual excitement in the house, Bertha had hastily dressed, and with half opened door had sought to discover the meaning of what was going on below. By dint of listening and of spying, and from hearing the joyous cries and conversation of the children, she soon found out something of the state of affairs, and learned that Laura had arrived, and was with her husband. Something Bertha contrived to hear of the interview between Beatrice and Lygon, and when she had watched the former leaving the drawing-room, Mrs. Urquhart stole down, and took the place at the door where Laura had stood trembling between a last hope and a last despair. Bertha made out that a reconciliation had been effected, and she ground her teeth in impotent anger. All was to be forgotten and forgiven between Arthur and his wife, but what would be Bertha's place in the household circle? Would there be any place at all for her whose sin had brought wretchedness to the English home, death to the home in France? Or was she to be mercifully treated, to be placed away in obscurity, to be provided for by charity, and to be preached into the pretence of repentance? Her state of mind and of health forbad her enduring the idea with ordinary patience, and with a flushed cheek and clenched hands she hurried back to her apartment.

"They are all too good for me," she repeated, as she made some hasty preparations for departure.

Mrs. Hawkesley's bed-room door stood open. Bertha glided into the room, and took a purse that lay upon the toilette table. Then, she came softly down stairs, stealing from landing to landing, watching lest she should be intercepted. But at that moment a new-found happiness engrossed those who might have stayed her. She reached the hall, again listened, and heard Charles Hawkesley's voice, and laugh of excitement. In another minute she had departed, to return to that house no more.

CHAPTER XCV.

Not that night, but the next day—not in that house, but away in the stillness of a lovely scene of green and shadow, Arthur Lygon and his wife sat for hours, and spoke of the events that had parted them. They had scarcely said, but had strongly felt that such a confidence should precede their return home, and they had almost instinctively chosen a retreat in which, in the earlier days of their wedded life merry hours had been passed, as also happier hours of quiet, of almost silent love. It was in a deep shade, and under the aged beeches where, as was long ago told, Beatrice Hawkesley had planned a joyous day, fated to be postponed until many sorrows should have been borne by her and by those dearest to her, that Laura and Arthur sat, too intensely happy to care much for the pleasant things around them, yet conscious that all was in accord with the music of their own hearts.

Long was the tale she had to tell him, as he lay at her feet—lay where his look was not directly upon her face, yet where the slightest turn of his head brought his eyes upon hers, and where, with a touch of his hand, he could tell her, needlessly now, that he accepted all her words with the faith of a child.

But that Laura began with the beginning, or ended with the end, or told her story as a stranger would have told it to strangers, is more than may be said. Nor might a stranger follow it with the eager affection of him who listened, and who found in a half-uttered word, or in a moment's pause, that which brought his hand to the hand of Laura. But this is something of what she had to tell him under the beeches.

When Laura and her sister, Bertha, were pupils at the school at Lipthwaite, Ernest Adair, or as he was then called, Ernest Hardwick, had recently been engaged as one of the masters. He had resided some time in the town, and had been strongly recommended to Mrs. Spagley, Laura knew not by whom; but the fact was that Marion

Wagstaffe, afterwards Mrs. Berry, had procured credentials for the young Anglo-Frenchman from some eminently Protestant friends in London. Acting under her counsels—and why these were so ready, and why so much aid of other kinds was afforded by her, needs not to be told to those who know the rest—Hardwick had gained the good opinion of her Evangelical friends by a device, not then so ordinary as it has since become, and one by which many an admirable and conscientious English woman has been deceived, and has deserved no reproach for her error. It is only those who know the intense conviction held by thousands, that the creed of Rome is the way to hell, who can fairly appreciate the eager zeal with which such believers welcome a Catholic who appears open to an effort for his conversion. Even now, when foreign adventurers have worked this mine until one would think its last lode was exhausted, we occasionally find a profligate and plebeian scoundrel, to whom no vice is unknown, succeeding, by dint of lying avowal that he is dissatisfied with the teachings of the Roman Catholic Church, and desirous of a more "vital" faith, in obtaining access to the homes of England, and in securing a favouritism which would be far more cautiously extended to a Englishman of social position. The police of France and England can tell strange tales of many who have sat, and even yet sit "at good men's feasts." But at the time in question, the game was not so often or so vulgarly played, and it is not to be imputed as a heavy fault to those who, prepared by Miss Wagstaffe's representations, received the handsome, thoughtful, and interesting young doubter, Ernest Hardwick, and, touched by his candour and zeal for truth, became the Aquilas and Priscillas to the convert, but aided him to procure such employment as should render him independant of the tyrannical priests, to whom he described himself as an unwilling slave. He came to Mrs. Spagley's with testimonials which brought the tears into the eyes of that well-meaning custodian of so many future wives and mothers.

But he did not come alone. With him came a companion, a Frenchman, younger than himself, who had been his victim in Paris, at a time when Henri Amyot was dissipating a handsome inheritance in the ordinary courses of a young gentleman's ruin. It was Hardwick who, while plundering his friend, did him the deeper wrong of demoralising him, and of converting a careless, self-indulgent, but not very profligate boy into a premature debauchee, and, finally, into a criminal who had placed himself within reach of the law. When Amyot's means were gone, and he was in a position of danger that rendered him useless to Ernest, the latter would have discarded Henri, and left him to his fate. But they were not to part company so easily, for the pupil had learned something from his master, enough to make Henri a most inconvenient enemy. Later in life, Adair, as he subsequently called himself, might have disposed of this difficulty in some bold fashion of his own. But he was then young and had not entirely divested himself of the natural affections. They had been friends before they were fellow-criminals, and there was something in the gentle and confiding character of Henri Amyot,—something in the almost childlike trust which he at first reposed in Adair,—which made Ernest reluctant to abandon to utter ruin the lad whom he had so deeply injured. Through all Amyot's vice there was a sentiment, lacking to Adair's, and even when Amyot was revelling in the wildest excesses, he managed to tinge them with a touch of romance, which, if it did not render them less hateful, might have excused some slight pity for the fanciful and impassioned Henri. Let it have been the tie which is so often formed by the conviction of superiority, or let it have been any temporary sensation of remorse, there was something that forbad Adair to cast away his weak and gentle associate into the abyss, and though he but withdrew Henri from one atmosphere of guilt to steep him in another, Ernest permitted his friend to cling to him, and the image of that fair young face, with its deep blue eyes and pensive expression, was perhaps the least depraved of the images which set out the temple of Adair's ungodly worship.

He brought Henri to England with him, and what such friendship as Adair's could do for him was done. Its best effort was but to give Amyot chances similar to those which Adair worked so well. But Amyot was indolent by constitution, and his nature, libertine as he was, recoiled from many a scheme which his master set before him. Henri, though he dared not avow it to the scoffing Adair, had a dream of extricating himself from the slough, and of uniting himself to some exquisitely good and beautiful English girl, of fortune and of piety, who might enable him to pass the rest of his life in an extreme of luxury, but a luxury elevated into poetry, and refined by purity. It was a modest aspiration for the pupil of Ernest Adair, but it was genuine. And when Amyot was established in England, where vicious indulgence was not only not forced upon him, but was scarcely attainable, his purpose strengthened. Poor boy, he took the best course that he knew. He made a vow of virtue, and he addressed himself to the study of religion—such religion as stealthily read books of Catholic theology taught, and which he adapted and improved to suit his own tastes by an admixture of a poetry which would have scandalised the authors of his manuals. At this time he enjoyed the only happiness of his brief and wasted life.

For, at this time, when his heart was softened, and even improved by his religious ponderings, and by his withdrawal from the debasing associations of other days, he was introduced, through Adair's means, to Laura Vernon.

The beautiful girl, just emerging into womanhood, and though happy, restless, too, from the sense that her happiness has yet to be complete and defined, was nearly the ideal of Amyot's dream of an English maiden. Her heart, her person, her sweetness of disposition, her gentle yet sensitive nature were all that he could wish, and he believed that his religious efforts had found favour, and that his destiny was to be happy. Ardent and trustful, he at once accepted the representations of Adair that the father of Laura was a man of boundless wealth, which he was hoarding

for his children, and poor Henri yielded himself at once to the only pure passion of his prematurely squandered life.

It was the first time in *her* life that Laura Vernon had felt her heart awakened, nor was it strange that the young and graceful Frenchman, with his deep blue eyes, pensive smile, and mingled religion and poesy should at once fascinate the carelessly educated girl. We have passed the stage of our story when it could be interesting to dwell on the progress he made in her affections, on the dreamlight with which she—she, at the age of dreams—invested the stranger, and how, with the alchemy of love, she found in her own disadvantages new reasons for loving him. When Henri turned his deep eyes upon her, and in that sweet voice told her of his religious doubts and fears, and exulted in urging upon her that her love had been vouchsafed as his reward, adding—we may be sure he did not forget them—all the more earthly and passionate pleadings of a lover who knows a shorter way to woman's heart—Laura, at seventeen, felt that her time had come, and surrendered her heart, not to Henri Amyot, the worn libertine, but to an ideal of passion and of faith.

In that attitude of cloud-worship were written those letters of which we have heard so much, and many, many more, which Ernest Adair destroyed. He destroyed them, when it came to his turn to read them for a fiendish purpose, and he did so because they were too pure, too holy, to be blended into the foulness which he intermixed. There were but a few of Laura's letters that, by accident, did not on their very faces refute the vileness which Adair and his accomplice sought to fix upon them—of these we have seen the fatal use.

Laura had loved Henri. Nor, as she sat under those beeches, did she seek by word or by tone to deny that it had been so.

The rest is soon told.

Henri Amyot died, and Adair killed him. Not with his hand, nor by violence, and yet at a blow.

With what base intent Adair had made his way to the weak and foolish heart of Laura's sister, what shame followed, and what vile use he made of his power over the girl, to renew the exercise of that power when the girl became a wife, is already known. At first he concealed his treachery from Henri, and encouraged him in the belief that he was on a road of flowers, and on his way to fortune and happiness. It was not until the two young hearts had been knit, until each believed in the happy destiny before it, that Ernest Adair struck his blow. And then it was given almost by chance.

Maddened at the failure of some scheme for raising money, and further stung by the unexpected and firm refusal of Henri Amyot to join him in a plan of fraud, Ernest Adair, as one day the friends were standing on the hill overlooking Lipthwaite, broke out in a torrent of vindictive insult, and met the expostulations of Amyot by a brutal revelation which told all. Mr. Vernon was a beggar, and Laura was the sister of a wanton. He had perhaps added some word—some scoff—against Laura herself, but he looked in the face of Henri Amyot, and he dared not.

He heard one curse—one of those utterances in which agony exhausts itself with a single effort—and then he had to raise the body of Henri Amyot from that hill-side, and to strive to staunch the blood that welled from the mouth. The earlier life of Henri had done its fatal work, and this one fierce blow was all that was needed. He did not die in Lipthwaite. Adair, in obedience to the only words Henri could speak, the only words he ever spoke again, removed him without farewell to a town at some distance, and in two days more chose his grave.

So broke that dream of Laura's girlhood. Heaven is kinder to our young children than to permit such grief to be durable, and with womanhood came the graver sense of the meaning of life. But that girl-love and its rapid ending made their mark on the character of Laura, and the portrait that hangs on Lygon's wall, and that speaks of troubles and of suffering, tells, though the painter knew it not—the husband knows it now—something that it had not told but for Henri Amyot. And that rosary of golden beads—you know now whence they came, and Arthur Lygon knows it too.

"And I *will* ask, darling, and yet I know the answer—why this was all kept from me. No, you shall not say. I did not deserve to be told."

"My own Arthur—I *dared not.*"

"Dared not?"

"I thought I knew your nature, Arthur, and I loved you too well to risk the happiness of being your wife. I had heard you speak of first loves, and you had declared that no woman loved twice. This was before we married, and I kept a secret which I never dared to tell afterwards. Oh, when you have praised my courage, and I knew that I was a wicked coward—"

"You shall not say it."

"But you know me now—you know me your own, heart and soul. Is it not so, my own?"

"My wife!"

"Yes. That is all I ask to hear. God bless you!"

"Does *He* not?"

And will they live happy ever afterwards? That is not for me to say, for, save one dark chapter, I have finished the story of the breaking and the re uniting the Silver Cord.

(To be concluded in our next.)

AMERICAN SOLDIERING.

The Civil War in America has an interest for us beyond the political or the philanthropic view of it. We ought to make a study of it as an illustration of a new phase of human affairs. In Europe the true Military Period of society is over, the philosophers tell us; allowing for an old-fashioned outbreak now and then,—like the career of the first Napoleon. This does not mean that war is over. It means that such wars as there are have a different aim and character from those of the true Military Period. Modern wars will, for some time to come, be in connection with commercial

interests, except in the cases, which must soon die out in natural course, in which force is necessary to drive out superannuated or evil-minded despots, not good enough for the age, or for the people who have lived under them. As the true Military Period gave place to another, the military mind and spirit changed, under the influence of new ideas and interests. Still the traditions of one of the chief stages of human experience were sure to live on for centuries; and when men at this day seem to be occupied with very different things, the lightest touch upon some old national association will wake up, in "a nation of shopkeepers," ideas and emotions very like those of ancestors who lived under warrior kings. We need not go beyond our own borders to see this. England is considered the representative of the Commercial Period at which the world has arrived. We have our Peace party, and agitators who uphold it to be a virtue to repress patriotic affections in consideration of commercial tranquillity. We believed, ten years ago, that we had lost our capacity for war, partly through long disuse, and partly because a generation had grown up without military ideas, and any patriotic emotions tending in that direction. We heard our young men deprecating military training, because it wastes time, and costs money, and may be mischievous in putting quarrelsome notions into people's minds. I, for one, heard such objections made ten years ago. Yet, what a rally to the old virtue and the old interests we have made since! Our second army in the Crimea and our present Volunteer force have proved the strength of the traditions which have come down from the military ages. It naturally follows that, when we make war, we do it under the associations and the emotions of the olden time. War is with us an ancient institution; and we have inherited the military spirit, ideas, and conscience which dwelt in our fathers, and which prevent war from being the mere savagery which it would be as a fresh characteristic of a new period of society.

The case is otherwise in the great democratic Republic of the new world; and this is the reason why the civil war in America is singularly important and interesting as a political and social study. Since I last wrote of the conflict, the battle of Bull's Run has become a piece of almost old news in England. Yet it seems to me that we have not even tried to understand it, or to study the indications it may afford.

The Americans are really as unmilitary as we supposed ourselves to be ten years ago; and they are, for the most part, as far from being aware of the fact as we were in 1851 from suspecting what a warrior heart lay under the costume of the British trader. "The Chivalry" of the Slave States commemorate their Cavalier descent; extol slavery as procuring leisure to make the gentry a military aristocracy, carry arms, preserve a show of soldiers, arsenals, sentries, morning guns and evening drums, &c., and keep the world in order, as they think, by threatening to seize the territory, and whip the backs of all nations who displease them. The South asserts itself to be the tiptop military aristocracy of the civilised world. At the other extremity of the country, the pretension is almost as strong, though different in aspect. The sons of the Puritans have grim portraits of the Forefathers as they stood in their armour, and cherish family traditions of the way their ancestors went to work to till the ground and transact their trade. The ploughman and woodman, and herdsman went armed as regularly as Southern citizens do now. The enemy then was the Red Indian, or some foreign invader; whereas the Southern citizen's foe at this day is his next door neighbour, or some townsman who prides himself on the number of "difficulties" he makes in the year. In the great North-west region, the population is heterogeneous; but it goes armed, to a great extent, between its apprehensions from Red Indians, runaway negroes, kidnappers, filibusters, or hostile rovers of one sort or another. Still, that population hardly considers itself military in its character, having no type in the past, and no traditional character to perpetuate. While the north-west boasts of having no ancestry, and claims the glory of being a new social creation in a new scene, the old Puritan race in New England has prided itself on having exchanged fleshly weapons for the sword of the spirit. Non-resistant doctrines have spread widely in that region; and its representatives find it a hard cross to bear when they go up to Congress to be sneered at by Southern men for carrying no weapons, and for a supposed anxiety to avoid all pretexts for duelling. Notwithstanding all this, New Englanders have the same persuasion that other tribes under the Union have, that they can flog the world simply by being the most military people, in the national aggregate, in the world. It is this persuasion, cherished under peculiar circumstances, and now brought to the test of fact, which makes the American civil war so instructive a study at present.

I believe it will be admitted in a little while by everybody, in America and outside of it, that the Americans are the most thoroughly unmilitary of the great nations of our time.

They inhabit a fresh territory, where there are no memorials of earlier periods of society. They have no neighbours who have gone through such periods in company with them, or under their observation. Their chief aims have been first, in their colonial days, a fair and comfortable subsistence; and since, an eminent material prosperity, as a sign and a result of able self-government, in conspicuous departure from the national models and political institutions of the old world. They have succeeded in their aims; but their success has destroyed that military character of thought and feeling which they have taken for granted must remain what it was when their fathers landed as soldiers, of one kind or other, from Europe. They are extreme representatives of the Commercial Period, in fact. They excel the rest of the world in the application of science to the arts of life: they are learned in the methods of creating and increasing wealth: they have the spirit of adventure which belongs to commercial enterprise, and its spirit of liberality in regard to the spread of knowledge, and of hospitality to strangers, and of munificent charity to the needy. All this and more they have; but of the military spirit they

have, as a nation, no conception. That they think they have, simply proves that they misapprehend the military ages and peoples of the world. Whether their unwarlike quality is a sign of progression or deterioration is not the question here. The important thing to us is the fact, as a key to the situation.

The circumstance which goes further to account for the fact than the newness of the terrain, or its isolation from the civilised world, or the heterogeneous character of the people, is the democratic form of government which the statesmen of ninety years ago ventured to inaugurate. That form of government tends to the cultivation of self-will in every shape it can assume; and an inordinate self-will is unfavourable to the military spirit in the highest degree. In every form of society, self-will must be restricted in one way or another. In the American republic, the checks in the different sections form a study in themselves: but all I can say now is that, in each, one man's self-will is checked by the stronger will of an equal; and this check affords no hope for military discipline. The actual working in the present case has been this:

For forty years the Southern politicians have been bent upon introducing the principle of slave labour throughout the Republic; and they have put to its fullest use the three-fifths suffrage which they obtained by bribery from the North in the last century. Obtaining by it the ascendency at Washington, they overwhelmed the Northern section by audacity, and by menace grounded on their supposed military character. The unwarlike North yielded; but this was by the self-will of the most self-seeking portion of the community overpowering the patriotism of better men. The newspapers were the means by which the baser minds acted, as they have now been the fatal betrayers of the Northern cause. The peculiarity of the Southern case has been that, owing to the absence of a middle class, the self-will of the dominant order has had no check—except indeed that of assassination. Despots over a population of slaves and "mean whites," the Southern gentry have become crazed with self-will. The last trace of true military quality disappeared when attacks upon defenceless men, broils, and a gross order of duelling were boasted of as signs of an age of chivalry. When several thousands of citizens of several States awarded honours to Preston Brooks for his assault on Mr. Sumner as something heroic, the Southern community unconsciously surrendered its last claim to the credit of any sort of military spirit. In full consistency with this state of things, the South exceeded all bounds of reason in her self-will about the government of the Republic; and at last provoked the citizens of the Free States to assert their will as the majority. It was an overwhelming majority; but the South was spoiled by long indulgence, and could not yield, according to the constitutional compact. Relying on the unwarlike character of the North, the Secessionist leaders defied opposition, and began a civil war.

By doing so, they fix attention on whatever they have done in the way of warfare. I am not going into the history here; but I may refer to the fact of the absence of discipline which has been remarkable wherever Southern troops have gone. In Mexico, they exhibited a spectacle which could be seen in no place where the military spirit existed. As Republicans, they would be bound by no compulsion to serve beyond their own voluntary promise, or mere will and pleasure; and companies, or parties, or twos and threes, were frequently seen stacking their arms and refusing to move in the crisis of some enterprise, or walking away on the eve of action. By the road side, or in some exposed place in camp, some delinquent might be seen tied neck and knees together, or somehow pilloried, for some breach of discipline,—these cruel punishments being inflicted on safe subjects, in the absence of regular penalties, which republican soldiers will not submit to. These are illustrations of a decided non-military quality in the Southern citizens, who feel as certain of being soldiers, born and bred, as of being whites. If we should be obliged to believe the stories now current of their barbarity to prisoners and wounded men last month, the evidence of their misapprehension of the military character will be complete. On the one hand, experience disposes us to disbelieve all wonderful stories told in American newspapers; and, on the other, as the habit of visiting personal passions on the bodies of slaves has led to the prevalent practice of assassination in that region of the country, it is only too probable that, after a battle and during a rout, men accustomed to strike and stab and shoot on the sly, may have perpetrated acts which soldiers in the old world would regard with loathing.

As soon as the same causes have an opportunity of operating in the North, we see the same effects produced. American sailors, like soldiers, cannot endure to be made machines of. This repugnance is a reason against military enterprise; and Northern citizens have therefore not been soldiers hitherto; but there must be sailors. This has been one of the most trying social difficulties the Republic has ever had to deal with. Naval commanders are not so happy there as in other countries, from the perplexity how to enforce discipline. The narratives of mutinies on board ship,—the few that become known,—are singularly melancholy; as, for instance, that which occurred in the Exploring Expedition under Commander Wilkes, in which it became necessary to hang at the yardarm the son of a Member of the Cabinet of that day. We see in the incessant occurrence of cruelties on board American ships,—now a stereotyped phrase in the newspapers,—the consequences of a lack of a habit of discipline, and of due provision for its enforcement. The necessary despotism under which alone the work of an army and a navy can be done, is an anomaly in a democratic republic; and there is no basis for any trustworthy understanding between commanders and the commanded. It was long experience of this, and a confirmed habit of criticism of Southern soldiering, which made the recent "uprising of the North" so interesting as it was to observers of a warlike crisis in an unmilitary country.

The self-will in the North showed itself in the newspapers before a company was on its march.

For reasons which it would take too long to tell, the power of the newspaper press in America is seized by men who are anything but practical, and who are wanting in the sense and modesty which business habits engender and encourage. The last mail of July has brought us an anecdote which tells the whole case in the briefest way. While almost every newspaper undertook to guide the President, to instruct the Cabinet, and to put the Commander-in-Chief under orders, the New York "Tribune" pushed to the front with its scheme of taking Richmond, and demolishing the rebels at once. In vain the Government held back, and the Commander-in-Chief declared that the means did not exist. The "Tribune" set up the cry "On to Richmond!" and roused the public to insist upon the attempt, by ascribing all delays to faults in the administration. The rulers set up by the people to rule were over-ruled, and the disaster at Bull's Run is the consequence. After it happened, the Government made a strong appeal to the editor of the "Tribune" to desist from interference with its work and its responsibilities. Such an appeal, backed by the hourly arriving news of the dead and the missing, and the immeasurable disaster of the rout, might overawe any man's pride, and touch any man's heart; and we see accordingly a declaration in the "Tribune," under the editor's well-known name, that he will never more offer any kind of comment on public affairs during the struggle, but will convey to his readers nothing but news, without criticism, suggestion, or any remark whatever. It would show some sense of the greatness of the occasion if other editors, not better qualified to advise, would offer the same pledge. They, like thousands of their readers, have been mistaking sanguine imaginings, and the social vanity which belongs to self-governing peoples, for patriotic ardour, and have doubted the patriotic ardour of all who were not in as great a hurry as they were. In this connection another incident has occurred, which impressed some persons deeply long before the march to Bull's Run.

The most experienced and thoughtful of the great Northern merchants have, from the beginning, denounced this kind of patriotic ardour, while themselves so ardent in their patriotism as to pour out their wealth into the lap of the State, and send their sons to the war when too old to go themselves. They have incessantly declared the first requisite to be "a business basis," in contrast to an emotional one, on which to build plans and action—a policy and its methods; and, when this "business basis" was not to be had, they avowed a hope that the Northern forces would meet with "two or three defeats at the outset." I understand, on good authority, that now they have got their wish they do not repent it. When the first desperate accounts of the rout at Bull's Run arrived they pronounced them exaggerated—as they turned out to be; and when the full amount of the disaster became known they admitted that they could not regret it, because the alternative was of something worse. These practical sages have reason for what they feel and say. They see that the self-will which they regard with a truly republican admiration, will be turned full in the right direction,—in the direction of each man's own duty, instead of that of other people's. They have a warrant for their hope in their constant experience of their countrymen's ability to set things to rights, and to learn from events. In civil life, it is remarkable how long an evil may go on unchecked in any American State; because what is everybody's business is nobody's business; but when some flagrant instance rouses attention, and the community gives its mind to a remedy, the remedy is the speediest and best conceivable. I remember, as one instance, the grievance of shipwrecks in a bay formed by the shores of two States. The coast of an island there was dangerous; and the pilots of each State were disagreed about their duty, and remiss in it. At last, a crowd of immigrants were drowned in a way which shocked the whole community; and a Bill was brought in and passed which contained a complete remedy in three lines. Such remedial measures in America, our lawyers say, never need recurring to. They require no botching, no supplementing, as our Acts of Parliament too often do. They may be long waited for; but, when obtained, they are found to be exactly what is wanted. Those who best know the Americans now look for a process of the same kind in military affairs first, and afterwards in political. The evil of presumption and ignorant meddling has exhibited itself in a wreck more disastrous than that in which the immigrants perished; and the scorners of discipline have proved more mischievous than pilots at feud; and the consequence already is a strong direction of the general self-will on the enforcement of discipline, and the securing of the proper conditions.

Not the less for this is the North as essentially unmilitary as the South. No degree of excellence in the army hereafter will surprise any sensible observer; but it will be of a different kind from anything that Europe has produced. We say that our soldiers are all volunteers, and we study with interest and admiration the difference between them and the automaton regiments of the Czar, where every man is not so much a machine, as a cut and dried portion of a machine, worth nothing but as it moves in its place. The difference between our troops and those which the Americans aspire to have is almost as great in their eyes as between us and the Russians. Not only is every American citizen-soldier to do his particular part well in his own place, but each is to make war on his own account, for a cause which he thoroughly understands.

So far from this being absurd, it is exactly what is now doing; but the preceding stage,—that of adequate co-operation, in other words, discipline, —is as yet deficient: and it would not have been the thing absent if the military spirit had existed. I know of nothing finer than much of the conduct of the citizen-soldiers, not only in "the uprising" (as it is, and always will be called), but in the whole march, and the battle, and I may add, the rout of Bull's Run. I need not go back to the incidents of the muster at the President's call; for nobody living will ever forget it: but I have caught glimpses of some of the men from the plough and the fishing-boat, and the forge and

the loom, as they stood in the midst of the hottest fire at the Bull's Run. There stood and fought two score of volunteers from a village in Massachusetts,—stood and fought for nine hours, in heat and hunger, and amidst the natural terrors of a first battle. They may have been among the unsoldierly fellows who ate up two days' rations in one, and finished their allowance of water, and had thought proper to run to the streams and drink on the march. They may have been to blame for their hunger and thirst. For aught I know they may have criticised their officers *en route*, and laid the blame since the defeat where they fancied it ought to rest. But they also fought like men each of whom felt himself a champion of the injured negro race, and a patriot pledged to the recovery of the constitution. One was a stout working man, who had run for hours, at the end of his day's toil, getting signatures to petitions to the legislature, while it was still time to preclude this war. He will run no more, for he left a leg at the Bull's Run. Another was a youth of eighteen, whose republican self-will had brought him into the field before he was fit for the fatigue of it. He had been helped when he showed himself immoveable; and the Puritan non-resistant relatives who could not conscientiously give him revolver or rifle, had stocked him with comforts,—with writing materials and canteen "fixings" in the smallest compass and most convenient shape. Here he stayed in the thick of the fight, till his colonel was down, and his captain killed, and the little band he belonged to was ordered to retreat. He could not retreat far, and as he sank he desired his nearest comrade to write to his father, and say that he was unwounded, but unable to go further. He was last seen lying by the wayside, and his name is in the list of the missing. Citizen-soldiers of this character will gain their political objects in their own way, and will make themselves enough of soldiers to take the shortest way. Not the less does it appear that it is not the military spirit that is astir within them, and that their conceptions are essentially political. I think so the more for the very incidents which are told as illustrations of the martial animus. When citizens who have hitherto been backward in action and in speech now propose to kill every white man at the South, in order to settle the two questions at once (of the constitution and of slavery) the notion is essentially unwarlike;—as much so as the officers' levity of talk about being "whipped," or the privates' lounge about the streets of Washington, gossiping about the disgraces of the rout, and criticising the counsel and conduct of their commanders. The whole condition of war is as yet unknown to them; and if they learn it, it will be by express study, with no aid from instinct.

The attitude of the chiefs on either side after the conflict is as strange a spectacle as anything that had gone before. General Beauregard, looking at a newspaper handed to him, and finding in it that he had gained a great victory, of which he had had no suspicion; General Scott in council at Washington, upbraiding himself for giving up his judgment to the dictation of civilians; the Government telegraphing to New York an appeal to a newspaper editor to desist from a particular course of comment; the best citizens declaring themselves glad of a defeat and rout; Confederate soldiers picking off stragglers and sentries, as they would steal a march on wolves: Federal volunteers walking away from their guns, guessing they'll go home and see how the old woman and the farm get on, and then come back; the whole field of the struggle, and all the details, are so unlike any conception of warfare in Europe as to be worth, as I said at the beginning, a close and patient study.

There is no doubt, I suppose, in anybody's mind that the Northern men will succeed, in their own way, and after certain delays. All indications point to the humiliation of the Secession faction, if any reliance may be placed on the universal testimony to the poverty of the party, the impressment of a portion of their soldiery, and the discontent of many more; the restless state of the slaves, and the consequent impossibility of recruiting the army; and the increasing manifestation of Unionist opinion in the Slave States.

I anticipate a brave and patient persistence on the part of the Free States, and an ultimate vindication of their republican principles, and emancipation of the negroes. There can now be no stopping short of these two aims. What the form of ultimate settlement will be, and whether the Republic can come out democratic from the ordeal of a civil war, is more than any prudent man will undertake to prophesy.

From the Mountain.

THE SPRING OF CLEAR WATER.

It was at noon on a sultry summer's day, that three travellers quitted the high road to seek refreshment at a spring, which they perceived at a short distance. The spring was overhung by a luxuriant growth of shrubs which flourished from its moisture, and in gratitude returned their shade to preserve its refreshing coolness. The waters, collecting first in a basin hollowed in the rock, overflowed in transparent streams, trickling in their course over the following inscription, carved on the rock:

"Be thou like unto this spring."

The separate streamlets kept joining each other on the coarse sand beneath the basin, and then flowed away, farther and farther, till united into a small rivulet they rippled through the neighbouring flowery meadows. The travellers, having quenched their thirst, while sitting to rest themselves for awhile, read the inscription, of which each gave his own interpretation.

"It is excellent advice," said one of them, who appeared to be a trader; he carried a knapsack on his back, his broad leathern belt seemed to contain something heavy wrapped or sewed within it, and his strong boots were covered with a layer of dust, seemingly from a long journey. "The spring," he continued, "runs without ceasing, wanders extensively, receives into itself the waters of other springs, and increases till it becomes a river, and by its example incites man

to ceaseless activity and unwearied industry, for the accomplishment of all his desires."

Hearing this, another of the travellers, an old man, carrying a book in his hand, shook his head, and said:

"The lesson here given is a much higher one than that. This spring is common to all. It quenches the thirst of every passer by, and yet demands the gratitude of no one. It clearly bids us do good, purely for the love of good, and to require no other reward."

The third traveller had remained silent during this time. He was a beautiful, fair-haired youth, who for the first time, and but recently, had parted from his mother. His comrades asked him his explanation of the inscription.

He reflected for a moment; then, slightly blushing, said:

"To me the spring tells a different tale. To what purpose would be its unceasing activity, and its readiness to assuage the thirst of all passengers, were it muddy and defiled by the earth? Its chief excellence is its brightness and transparent clearness. Its inscription exhorts us neither to industry nor to magnanimity; but to be like this spring ourselves, to preserve the soul in such unsullied purity, that it may, like it in its course, fitly reflect the flowers of the earth and the splendours of the heavens." W. K. W.

WELSH EISTEDDFODS.

Notwithstanding the jealous care of antiquarians and archæological societies, there are but few places in the kingdom where old customs have not disappeared in these days of railways and telegraphs, as if the country had become too utilitarian, or too engrossed in business to waste time or money in shows, guilds, and pageants.

To me such occurrences as the Preston Guild, the Lady Godiva procession at Coventry, and the Shrewsbury pageant are interesting and picturesque, and if of no use, afford at all events a pleasant holiday to many hard-worked townsfolk. Of a higher and more attractive, because more national class of meetings, the Eisteddfods of Wales are worthy of record, not because they are likely to become extinct—for they seem at this moment more flourishing than ever—but because the Welsh appear to be the only race, a component part of Great Britain, which has not had its nationality so rubbed out, if one may use the term, by constant intercourse with the English, as to forget that it ever had any national customs.

While the amount of good that these Eisteddfods do, as they are at present carried on, may be questioned, they certainly offer a field for local genius, which would otherwise never be displayed, and also perpetuate Welsh characteristics of temper and talent to a remarkable degree.

Among these characteristics love of country is certainly a very marked feature, and a determined belief that everything good had its origin in Wales; not to mention a pugnacious way of arguing the case, when doubt is thrown on their assertions by incredulous heretics.

Tell a Welsh dissenting minister that the Church is gaining ground, or a bard that the Eisteddfods are nonsensical, and you are overwhelmed with a storm of fiery reproach, followed up in the county paper by a number of strongly-worded letters, in which the subject is pursued until the editor inserts a notice that all future communications must be paid for as advertisements.

It certainly is a great question how far the Eisteddfods are useful or mischievous, some asserting that as long as the Welsh is kept up, so long will the English language be retarded; while others rush to the opposite extreme, and think that by proving that bardism began with Adam, they have done signal service to their native country.

The truth probably is that these assemblies are neither very good nor very bad, but might be made productive of much use, when divested of their mummery, by developing national talent and encouraging sound instruction.

And if their promoters like to dress themselves up as bards and druids, and if plain Mr. Jones likes to dub himself with the high-sounding name of Taliesyn or Cuhelyn, there is not much harm in it. Tennyson and Tupper might call themselves Ossian and Chaucer if they pleased. Not that I would ever place our modern bards in the same category with the Welsh poets, who I rather think have a dim notion that nobody would listen to their effusions when offered to the public under their own names. However, apart from these absurdities, there is no doubt but that a large amount of old Welsh lore, which would otherwise have sunk into oblivion, has been kept up, and much interesting information elicited; and if the English language, which is so rapidly gaining ground in Wales, was only more encouraged, instead of being kept so much in the back ground, the Eisteddfods would really become valuable institutions. And in saying this I do not wish the Welsh language to become extinct; but when we observe how the other national languages, such as the Erse, Manx, Irish, and Cornish have nearly all died away, it is folly to fight against an inevitable order of things; and the Welshman will best consult the interests of his country, while preserving her old customs, by adapting himself and fellow Cymri to the requirements of the age.

As the Eisteddfods are of ancient institution, and are conducted after a traditional fashion, it may not be uninteresting to detail the proceedings for the benefit of such of my readers as may not have witnessed one. An Eisteddfod (plural, Eisteddfodau) Cymreigiddion is an assembly of Welshmen for the purpose of hearing speeches, essays, music, and poetry in the Welsh tongue, for all of which subjects prizes are offered, frequently amounting to a very considerable sum. These meetings are known to have been held, as early as the sixth century, on an eminence near the now fashionable watering place of Llandudno, although the first detailed account did not take place until 1176, when Rhys ap Gryffydd, Prince of Wales, held a congress in Cardigan Castle, on which occasion the prize for poetry was gained by a North Welshman.

The opening of the Eisteddfod is usually preceded by some mysterious ceremonies called the Gorsedd, for which a pedigree is claimed dating from 1000 years before the Christian era, and which can be conducted only by those who are initiated into the sacred rites (or mummeries, as many may be disposed to call them).

The place for holding the Gorsedd is usually an open space, in the centre of which is a huge stone, the "Maen Llog," surrounded by a circle, thirty feet in diameter, of twelve other stones, supposed to represent the signs of the Zodiac. On the outside of the eastern portion of the circle three other stones are placed, in such a position as regards the Gorsedd stone, that lines drawn from it to them will indicate the rising of the sun in the summer and winter solstices, and the equinoxes respectively. The form which these lines, or pencils of light as they are termed, would assume in the mystic symbol of the bards and druids, and when written down appear thus /|\, is in fact the druidic expression for the Creator of all things. To this Gorsedd stone a solemn procession is formed, which is at least curious and picturesque, owing to the peculiar dresses assumed by the different orders. The colour of the bards is blue, to symbolise the blue sky, and supposed to indicate peace and tranquillity; the druids are dressed in white, significant of great purity; and the ovates or candidates for the higher orders are (rather unfortunately) habited in green, to represent the grass of the field, which is typical of growth and progress.

Another singular custom is the carrying of a sword by a bard, who holds it by the point, to show that he is a man of peace, and would rather turn the weapon against himself in preference to any others.

On arriving at the circle, a prayer, said to have been composed 1300 years ago, is recited to the following effect:—

> May Heaven grant strength,
> And to strength add understanding,
> And to understanding, knowledge,
> And to knowledge, what is just,
> And to what is just, love,
> And to love, the love of all things,
> And in the love of all things, the love of God.

As soon as the prayer is finished, the Gorsedd is declared to be opened, and the business of conferring degrees on the bards and ovates is proceeded with. Of the three orders the ovate is the lowest.

Under the old druidic dispensation, he was required to devote twenty years of his life (rather a long period of incubation) before he could qualify as a bard, to gain which honour he had to study the laws and maxims of the institution, generally in verse, besides using his brains to compose fresh ones. At the expiration of his time he became a bard, which gave him the privilege of holding or presiding at Gorsedds, as well as instructing disciples, which was usually done in a series of pithy truisms called triads. Although they are full, even to repletion, of wisdom, they are characterised a good deal by repetition, and were sometimes not a little obscure to ordinary mortals who had not the advantage of studying them for twenty years; as for instance, "the three dignities of poetry are the praise of goodness, the memory of what is remarkable, and the invigoration of the affections." And again, "three things to be chiefly considered in poetical illustration—what shall be obviously, what shall be instantly admired, and what shall be eminently characteristic." Some of these "proverbial philosophies" are rather graceful, as "the three primary requisites of poetical genius:—an eye that can see nature, a heart that can feel nature, and a resolution that dares follow nature." Literature, however, was not the only thing that the bards had to look after, for morals also came within their scope, as we find that the three ultimate objects of bardism were "to reform morals, secure peace, and follow everything that is good,"—a delightfully comprehensive view of the whole duty of man, which was still further carried out by "the three things forbidden to bards—immorality, satire, and bearing of arms." The only thing that one wonders at is, that so many people could be found to undertake such heavy responsibilities. I fancy, though, that some of these laws must be obsolete, for I know at least two bards who are enthusiastic members of a rifle corps. In former times, it was considered rather a good thing to be a bard; for we read in one of the laws of Howell Dda (the Welsh Coke upon Littleton), that whoever injured a bard, even slightly, had to pay a fine of six cows and 120 pence, while a murderer of one was mulcted in 126 cows. Bards also had the privilege of passing in safety through a hostile country, of maintenance wherever they went, and, what was more valuable to a Welshman than anything else, according to Giraldus, their word was to be taken before that of any other person. Nevertheless, it is to be feared that the bards were not the perfect characters they ought to have been; for it is recorded that Gryffydd ap Cynan, one of the kings of Wales, in order to restrain their inordinate vanity, enacted, "That if a minstrel offended in certain points, any man whatsoever might arrest and inflict discretional punishment on him—seize whatever property he had about his person." The highest order of all was that of the Druids, who united in their sacred persons the office of priest and judge, and traversed the whole country trying causes and instructing the people. Though the worship of the Druids is generally looked upon as a mixture of the savage and the impious, it is probable that they were clever observant men, well versed in many of the phenomena of natural philosophy, by which they maintained their power over the people. But Druidism as a system does not appear—according to the statements of some of the literati cymreigidd—to have been of that heathenish nature with which it is popularly invested—at least, so I understood a speech made at an Eisteddfod at Llangollen, in which the hearers were informed that bardism was as ancient as Noah, or even Adam, and when the dispersion of nations took place, the Cymri were the only ones who, without revelations, kept the true religion undefiled; so that when the Messiah came, they saw that He answered the types they had of Him, and accepted the Gospel

as a completion of Druidism, which consequently was the basis of all Christianity—a very satisfactory and complacent way of settling all difficulties upon the point.

The peculiar systems of the Druids were not to be revealed except to descendants of the order, amongst whom there are some even now existing, who carry the fearful secret in their breasts, which they are bound to keep inviolate under fear of pains and penalties, to which the conventional red-hot poker of freemasonry is nothing. Above all, if the Archdruid holds secrets in proportion to his rank, it is a wonder how he can go through life: but not only does he do so, but is a very affable and pleasant-spoken gentleman, who, if you chance to meet him in company, as I had the pleasure of doing, does not overwhelm you with an undue sense of his exalted position. But the Archdruid at a dinner-party, and the Archdruid presiding over a congress of bards, are very different people, and I feel shocked to this day at having ventured to speak familiarly with a being who, as he himself informed us at a Gorsedd on the "Maen Chwyf," or rocking stone, on the banks of the Taff, was "the representative of the first progenitor of mankind, and was also figuratively the sun of the moral world!"

Having examined the leading features of the Gorsedd, I will briefly describe those of the Eisteddfod, which is thrown open to the *profanum vulgus* who are not initiated into the mysteries of bardism. This is, after all, the most important business of the day; and if on a large scale, as those at Denbigh last year, and at Merthyr Tydvil the year before, attract a large number of visitors as well as competitors for the prizes. The programme consists of speeches, essays, poetry, and harp playing, which is almost always the cream of the whole performance. Of the former some are good, and evince much patient research and learning, and when on a sensible subject, —such as "The Mineral Resources of Wales," which gained a prize at Llangollen,—are calculated to be of immense utility to the country.

A very common form of poem is the "Englyn," usually composed in honour of some person or some personal event, and generally embodied in a few lines or stanzas. Frequently they are racy and expressive, but too often—particularly in small local Eisteddfods—the englynion in praise of a person are fulsome and laudatory to a laughable degree.

The harp playing is always more or less good, and, from its characteristic nationality, is pleasant to hear. The Welsh harp, however, appears to have derived its origin from Ireland; for, as late as the eleventh century, the Welsh were accustomed to pass over into that country to receive instruction in the harp and the bardic profession generally; and it is said that Gryffydd ap Cynan, before mentioned, brought over from thence "divers curious musicians," from whom was derived a great part of the instrumental music. The harps used at the performances of the Eisteddfods, as elsewhere in the principality, are not the large pedal harps which are turned out all gold and ornament from Erard's factory, but are rather small, triple-stringed instruments, which, to any one but a native, would be perplexing in the extreme. Many of them, however, are of very great sweetness, and are adapted before all others for the simple pathos of the Welsh airs. The most peculiar performance connected with the harp is the style of accompanied singing known as "pennillion singing," which certainly, I think, nobody but a Welshman could ever imagine or execute. The singer does not begin with the strain, but strikes up whenever he likes, at the third, fourth, or fifth bar, although at whatever point he commences, he is in duty bound to end with the strain which contains eight bars. The great point seems to lie in the number of words that they can cram in, so as to bring the air and stanzas to a simultaneous conclusion. To judge by the frequent applause which pennillion singing always evokes, it is evidently the favourite portion of the programme with the Welsh hearers, who, I fancy, care more for the music and englynion than anything else. Indeed, nobody who has ever lived in the principality can fail to remark the universal love of music in the Welsh character, in some cases amounting almost to a passion.

There are few towns or villages which do not possess their choir (probably attached to some chapel), which attends at the different Eisteddfods for the purpose of competing for a prize, and sustaining the reputation of the neighbourhood. Sometimes there is an individual competition, the subject being an air out of the "Messiah," which is the oratorio *par excellence* of the Welsh; while on other occasions each choir is at liberty to select what they like best. In the mining districts particularly there is a great passion for Handel, and the "Messiah" in particular, and I am bound to say that difficulties never stand in the way of a Welsh choir, for they almost always select a chorus in which there is most fugue—a style of music which appears to delight them immensely. The hymns and anthems which every choir-leader is sure to compose for his flock, generally abound in rapid runs and fugues, in which the different parts are certainly taken up with great precision. It is a pity that with all their innate love of music, and their capabilities for it, that the Welsh do not possess a wider range, and that a greater knowledge of the works of the great masters is not more frequently attempted, as has been done in the case of the Lancashire and Yorkshire folks, who have by such practice attained a reputation as first-rate chorus singers; but it is to be feared that the national vanity and conceit stands in the way of all improvement, as it has so frequently done before. G. P. B.

FROM MY WINDOW.

BEFORE SUNSET.

Framed in the open window,
'Gainst a background of green and red,
The sweep of a flowing garment;
And the droop of a queen-like head;

And a delicate hand outstretchèd
To gather the leaves of the rose,
And a voice that carols the story
Of Love, its joys and its woes.

The clouds are rosy above her,
The trees catch the hue of the sky,
Where they bend to the distant gable
All a-glow with an amethyst dye.

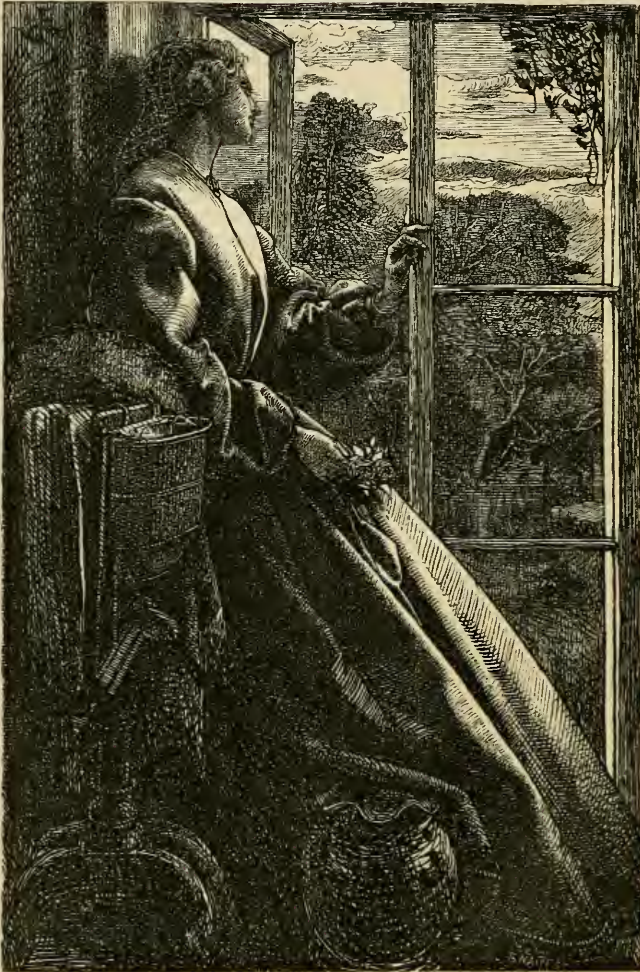
AFTER SUNSET.

A noise at the garden wicket,
A heavier step on the ground;
Two voices talking in whispers,
And one has a deeper sound.

Two figures framed in the window,
Blurr'd in with the leaves and sky;
The breeze from the grave of the daylight
Coming up with an ominous sigh.

The black trees mourn o'er the gable,
The mists steam up from the dell;
Of two, that are framed in the window,
There's one that loves far too well.

FRED. H. WHYMPER.



COTTON AND THE COTTON SUPPLY.

PART II.

It is very curious to observe the opinions of a former age in respect of novelties which have been matured and perfectionated—suffered to take root and yield their fruits only in our own. Montesquieu confessed himself decidedly opposed to all mechanical contrivances, on the ground of their pernicious action upon the manual industry of skilled labour. In a work written by Lancellotti in 1636, there is mention made of a certain genius who constructed a loom, by which haberdashery was so immensely multiplied that the municipal council of Dantzic took fright lest the heads of the citizens should get crushed by cogs and levers, and the hands of their artizans be tied and fettered with the ribbons of an automaton. The sentence which, in virtue of this decision, was pronounced against the artist, was death; a just

punishment, or at any rate, a fair retribution for the injuries his mathematical combinations had inflicted upon mankind. Beckmann speaks of the expediency of suppressing this sort of mechanical applications by some general consent among governments, as of a question difficult to handle, but too urgent to be repudiated. In Germany, when this fever of invention was running highest, as fast as looms were set up and their capabilities displayed, they were burnt or proscribed by public authority. In 1719 the Emperor Charles renewed the prohibition he had first promulged on this subject in 1685. Fifty years afterwards, however, things so thoroughly changed that looms of various kinds, and designed for diverse purposes, were not only common, but in Saxony premiums were actually bestowed for such further improvements as would augment their powers of production, and extend their usefulness. No wonder the worth of modern mechanical appliances made itself keenly felt at last through the thick, chilly clouds with which habit, prejudice, and conventional interests had shrouded it; for in those good old times, when they did not exist, a spinner sat at his work a whole year to produce as much yarn as can, with our present aids and expedients, be spun in a single day. One Englishman at his mule turns off daily a deal more yarn, and of a far finer quality, than do two hundred of the most indefatigable spinners that Hindostan ever produced. Velocity of motion is the cause of this immense power of creation. The machinery employed is enormously active. A calculation of results reads like an exposition of astronomical phenomena. Why, the spindles and bobbins on to which the thread is wound revolve in one minute more than five thousand times. One pound in weight of the finest thread made (No. 1000) is so amazingly slender that it stretches in length 477 miles. The first inkling of a progress destined to lead eventually to these grand accomplishments, occurred in 1767, or a few years later, to James Hargreaves, at Stanhill, near Blackburn, in Lancashire. His idea, thoroughly worked out, revealed itself afterwards in the form of his celebrated spinning jenny. This contrivance enabled one little girl, without any external assistance whatever, to work at once no fewer than 120 spindles. Fancy the importance given to a young child by becoming the guiding providence of machinery which with such unerring precision and speed was multiplying thousands by tens, nay by fifties—not of the threads of calicoes and stockings only, but of good Bank of England notes. This of course imparted to 1767 a rubricated distinction which brings it out prominently from among the years of the century, at least in the eyes of a Manchester man and all subsequent Chancellors of the Exchequer. Not of course that the total amount of development to which this industry has attained is ascribable directly either to James Hargreaves or his spinning-jenny; but the inauguration of an era of mechanical contrivances took place when this ingenious and important invention occurred, and accordingly we cannot doubt but that the emotion with which cotton-spinners and financiers look back to it is deep, suggestive, and satisfactory; for whereas before this period only 200,000*l.* worth of cotton goods were manufactured annually throughout the whole country, occupying about 30,000 persons, since the progress to which it conducted, their production has expanded so rapidly, that at the present moment they are perhaps hardly represented by 37,000,000*l.* sterling, a sum which it must be borne in mind the lapse of only about ninety years has, by means which may all be traced to this spinning-jenny and the little girl, proved adequate to create.

In 1771, Highs constructed what may be termed a double jenny. This had twenty-eight spindles on each side, and turned by a drum in the centre. To show both the simplicity of its action and its capabilities, Highs' son, a child only two years old, worked it publicly in the Manchester Exchange in 1772. The reward for this piece of ingenuity was a purse of 200 guineas. This same year was also memorable for the production of calicoes, which were now for the first time manufactured in Manchester, and muslins succeeded about ten years later. But to keep to spinning. As the principle of these modes was adopted in disparagement of the distaff, so Arkwright's adaptation of rollers to the same purpose had the effect of superseding the clever but inferior contrivance of Hargreaves. Samuel Crompton, who was born in 1753, made an important discovery in his invention of the "mule," which is by far the most suitable of all instruments for the spinning of fine yarn, specimens of which, from the best quality of cotton,* have been sold for lace making at no less than 20 guineas the pound. Arkwright's throstle, which was at first called the water-frame, spins nothing, I believe, higher than No. 36, but the value of the invention is to be estimated from other considerations. Water-twist has thoroughly supplied a desideratum, the want of which was felt as a sore hindrance to the complete success of the cotton weaver. He is now enabled to fabricate stuffs wholly of cotton, and this advantage alone, derived entirely from the nature of the twist, viewed economically, reflects upon Arkwright so much credit for his ingenuity, and entitles him to so much gratitude for the immensely beneficial consequences it has involved, that apart from the other great and comprehensive objects he accomplished in such signal perfection, he has won from posterity the admiration and blessing of thousands, as the author of a boon so complete.

Mr. Crompton's mule-jenny combines both the principles which guided his predecessors, and performs such marvels in respect of tenuity, that it requires greater weakness and even credulity than are possessed by the readers of "Baron Munchausen," to believe the accounts on the subject without first seeing demonstrations of their veracity. But the factory system, as we behold

---

* From 1789 till 1792 Mr. Robley cultivated cotton of the rarest quality in the Island of Tobago, and it was from the wool of these plantations that the yarn referred to in the text was spun. Unfortunately the failure of the sugar crops in the neighbouring French islands induced him to substitute sugar-canes for the cotton-shrub, and, in consequence, cotton of equal excellence has perhaps never since been obtained.

it existing at the present day, constituting a wonderful monument of the highest mental attainments, of the most indefatigable industry, and of phenomena physical and moral such as are combined with equal effect in no other instance,—this most striking spectacle of all which the world of manufactures can present,—owes its origin and happy solution to Arkwright. It was at Cromford that he first tried the experiment, and established its success. In a factory he there constructed he introduced the multifarious processes of spinning, weaving, &c., conducted by a complete organisation of labour. They have constituted the ordinary operations of our gigantic cotton workshops ever since. The oldest mill in Manchester, reared by this benefactor of mankind, and, I believe, still standing, was built on Shude Hill in the year 1780. It was not here, however, that the mighty power of steam was first displayed. Watt applied the steam-engine in 1785, but at Papplewick in Nottinghamshire, where it spun the first cotton yarn produced by the new and wonder-working agent. In 1789 Manchester adopted the innovation. When the power-looms regularly took up their places in these huge beehives of human industry, the embodiment of the idea in its full consummation must have afforded infinite complacency to the mind of the projector. A mill with 50,000 spindles and 750 hands, producing three hanks of thread of 850 yards each, per spindle daily, in the opinion of an Arkwright, is a spectacle of vast and paramount interest, affording an amount of satisfaction and delight of which the votary of mere pleasure has never been able to form the slenderest conception. And to this add the beautiful and unerring expedients by which the web is knitted together with a rapidity next to miraculous, and at a cost comparatively so trifling, and the work of elaboration is arrived at its climax. The inventor of weaving by this magical process, that is to say, of these power-looms, I must not neglect to state was the Rev. E. Cartwright, of Hollander House, Kent, who, from a source apparently so little associated with the concerns of a factory, thus contributed that element of integrity which may be regarded as the masterly finishing stroke to the grandness and comprehensiveness of the system. This gradual introduction of mechanical auxiliaries did not fail in this instance any more than in all others, to arouse the antipathies of the prejudiced and the vulgar. Sir Robert Peel, the father of the illustrious statesman, was one among many who suffered from the hostility of a violent mob. His machinery at Altham was totally destroyed, and so much did he take this act of lawlessness to heart, that he withdrew at once to Burton in Staffordshire until a gentler spirit and calmer temper rendered his return safe and desirable.

Now, in order to obtain some notion of the wealth and importance of the "cotton lords" of the nineteenth century, with Sir Richard at their head, let us pause for a moment and survey the area of factories spreading over so wide a surface of the county of Lancashire. The district immediately around Manchester contains two hundred of these town-like workshops, each of the better class of which costs no less than 100,000*l.* This valuation is equally correct in its application to other numerous factories, uplifting their tall chimneys in neighbouring towns and villages of the same busy locality.

Within the parochial bounds of the town of Bolton we can count some 70; the parish of Bury furnishes 120 more; at Rochdale we reckon 100; in Oldham parish about twice as many; Ashton supplies upwards of 70; and Staley Bridge, taken with Hyde, more than 60; all of which places are situated within half a score of miles of their common metropolitan centre. This makes altogether a total of about 820 in factories, and therefore nearly as much in hundreds of thousands of pounds. Nor does this computation exhaust the subject, for if we extend the range of our circumspection over other districts still watered by the Mersey and its tributaries, we shall find groups and groups in thick abundance wheresoever we glance, without diverting our attention to those other important cotton establishments which have enriched and invigorated such large portions of Yorkshire, Derbyshire, and the neighbourhood of Glasgow. The amount of capital embarked in cotton industry, in England only, has been estimated, in the year 1860, at 100,000,000*l.*, which, compared with the 35,000,000*l.* of twenty-five years ago, serves to give some idea, not only of the absolute immensity of the interest involved, but likewise of the rapidity with which it has attained its present enormous growth.

Manchester, of course, with its population of 500,000 persons, out of which are more than 24,000 spinners and weavers, and 700 calico-printers, by far and beyond all comparison figures the most prominently in this computation; and America is as surpassingly the leading market from which the yearly total of five millions of pounds of cotton is dispatched to satisfy the voracity of these factories. It has been calculated that 1,390,938,752 lbs. of this article was, from the different producers of the whole world, imported into Great Britain in 1860. This importation is, I believe, in magnitude unprecedented, and it will be readily believed it represents a consumption a deal larger than that of every other country on the earth taken collectively. When we consider, too, how rapidly it is increasing, the events of the day, so inevitably destructive of even the ordinary supply, acquire a commercial as well as a political significance, in which this kingdom is very chiefly and profoundly entangled. And to show the vast importance of our transatlantic resources, we have only to remember that out of the 4,321,000 bales, which on an average constitute the European demand for cotton annually, 3,500,000 come from America, of which one-sixth is shipped at Charlestown.

After England, but at a considerable distance, her receipts being not one-third in quantity those of this country, France is the greatest cotton-importing country of all. Her cotton goods are in high estimation, and though perhaps as to quality they may be in the main slightly superior to those of Switzerland, the Swiss, likewise, enjoy a long and well-deserved reputation for skill, taste, and excellence in this manufacture. The Prussians are not famous for their cottons, and the Russians even less

so. But the once United States, until bayonets and ramrods monopolised their attention, were actively employed in this species of labour; and as the advance they have made since its commencement among them has been in every way remarkable—from 1810 to 1830 the direct increase in production being more than 500 per cent.—we have long been accustomed to look across the Atlantic for future competition in what is at present almost exclusively our own peculiar branch of industry.

So extensive an organisation of labour as is presented in England by the manufacture under consideration, may well have excited the interference of express legislation. In June, 1825, an Act was passed to regulate the industrial economy of the factory, and it may be regarded as the basis and frame-work of all subsequent enactments which have from time to time been called for as experience ripened and new circumstances arose. Children form so large a portion of the population of a cotton-mill that it was right the law should enforce regulations in regard to labour, which would protect them alike from the hurtful exertions of tyrannous masters and the cupidity of indigent and unnatural parents. The age of the child, the duration and disposition of its hours of labour, and the providing for it ample opportunities for taking meals were, therefore, together with certain other provisions connected with moral and sanitary considerations, the main objects of legislation.

Children below thirteen years are contemplated by the law with more tender mercy than are young persons, or those between this age and eighteen, just as men and women, or those who have passed this latter period of life, are still less the objects of its clemency and protection. In the employment of children a certificate of strength from a surgeon is requisite, and if they have not attained their eighth year their services are not legal. Those below eleven are not to be worked for more than nine hours per day, and none to commence earlier than five in the morning or continue at their occupation later than nine in the evening; and one hour and a-half is the minimum allowance of time for meals. Then the whole of Christmas Day and Good Friday, besides eight half-days, are to be granted every year to children and young persons for holidays and half-holidays, and a variety of other stipulations into which it is needless to enter, manifest the same consideration for the health, enjoyment, and comfort of the little slaves, and reflect great credit upon the legislature for the wisdom and benevolence by which they have been dictated.

The foregoing statements will prepare us to hear—and it is a fact which has been confirmed by the progress of only the last hundred years, before which not a yard was exported—that our exportation of cotton goods nearly equals that of all our other manufactures put together. By way of illustrating this preponderance let us look for a moment into the tables representing the monthly exports of our home manufactures and their declared value. I have taken the month of March, 1860, for no special reason but that of convenience. Here we perceive the smallest figure is that representing the value of telegraphic wire and apparatus, namely, 4745*l.* Plated jewelry, which short of our textiles constitutes the largest item, is put down at 46,167*l.* But as we get into the textile class of exports these values considerably augment. Thus, linens are represented by a sum of 326,018*l.*, and linen yarns, 173,725*l.*, in all, 499,743*l.*; and then woollens give a sum of 987,982*l.*, and woollen yarns of 281,387*l.*, in all, 1,269,369*l.*; which swells into a very serious amount. But what is it, nevertheless, in comparison with cotton and its magical significance? Here we have cottons of various descriptions, valued at 2,941,759*l.*, not very far from twice as much as linens and woollens put together; and then add to this the yarn estimated at 807,848*l.*, as we have done in the former cases, and we arrive at the prodigious total of 3,749,607*l.*, which, remember, represents (what may be deemed) the monthly value of our cotton exports only; whilst to obtain a complete view of the entire subject, we should add another sum, closely approaching upon 5,750,000*l.*, for the average home consumption of the same recurring period. And now, satisfied that the reader is sufficiently impressed with the magnitude of our stake in cotton husbandry, to feel a more than common interest in its welfare and extension, I shall conclude with a few words—into a *very* few I cannot compress them—upon the resources we may possess other than those which are now so fatally endangered by the perpetration of political discord and civil warfare.

The interior of Africa produces the cotton plant in rich abundance, and the inhabitants, aware that its linen is much less conductive of heat than that composed of either wool or flax, spin the fibre it affords, and weave the yarn thus obtained into shirts, turbans, and sundry sorts of cloth adapted for other articles of raiment. But more accessible parts of this mysterious quarter of the world might easily be made available for the cultivation of the product in question. In Natal cotton is found equal in quality to the American, and its culture is beginning to attract practical attention. Several other spots of the coast of Africa are well suited for the purpose, and might doubtless, with due energy and knowledge of the subject, be soon converted into little mines of moderate wealth. Before we quit our notice of this region of the earth, I would make one more observation. Suggestions have lately been offered for substituting for cotton other fibres of analogous character. South Africa affords one of the best of these in plenteous profusion. It is an indigenous plant, belonging to the family of Amaryllideæ, and yields a fibrous wool so strongly resembling that of the Gossypium in texture and consistence, that from all accounts it might be readily adapted to precisely the same uses. So long ago as 1847 a patent was granted for the application of this new substance to textile purposes. The late Mr. Crompton, the celebrated paper-maker, turned his thoughts to the discovery, as one which might furnish to his branch of trade an advantageous material. But Mr. Crompton died, and the matter dropped.

Some of our finest cotton comes from Brazil, and is of the same long-stapled class to which

the Georgian belongs, this latter being, with the exception of course of the Sea Island, the only cotton of North American growth possessed of this highly-prized characteristic. But the great rivalry set up by the agitators on behalf of the diffusion of cotton planting is between the West and East Indies, in favour of which both claims seem so indisputable that nothing remains but to listen to each. With regard to the West Indies, a number of circumstances conduce to promote its abundant and profitable production, although on the other hand it must be confessed there are difficulties to be met, of which we have not yet received any satisfactory solution. Porto Rico has afforded cotton scarcely inferior to the Sea Island. When American cotton was first imported into England, it was so ill cleaned that but small value was set upon it; and before this period it was the West Indies which supplied us very principally with wools of the best description. In 1787, 6,800,000 lbs. came from these islands as against 6,000,000 lbs. from the French and Spanish colonies, and 5,700,000 lbs. from Smyrna and Turkey. If the spirit of Mr. Bazley, the enlightened member for Manchester, had some three years ago animated the breasts of his fellow-townsmen, Jamaica would probably at this moment be sending us a million of bales a-year. Its growth in that island is as simple as the most propitious conditions of soil and climate could render it. It has been produced experimentally upon the hills within the last few years with trifling labour; and upon the plains, with the average good fortune of fair weather, its cultivation is still more easy and remunerative. And as to fineness, there appears to be from the testimony of those best entitled to pronounce, no question of its excellence compared even with the most renowned which comes into the market. Both in this island and in Demerara it is not an exaggeration to say that hundreds of thousands of acres exist perfectly suited to the cultivation of this plant; and in Trinidad, where the climate is equally favourable, large tracts of land, whose soil is in no respect inferior to that of these other islands, might be with similar expectations applied to this valuable purpose. The difficulties to which I have adverted have, notwithstanding, created hitherto many formidable obstacles. The abundance of labour supplied by Jamaica in particular would seem at first to be a very important element of encouragement in the venture. But it must not be forgotten, that unfortunately the coloured population of these islands, and indeed of all places where slavery does not exist, are in relation to the amount of work they perform almost worthless as compared with other races, or with their own under compulsory treatment. Their demoralisation and constitutional sloth are evils which must be corrected before we can look for that conscientious assiduity which, in these days of keen and active competition, lends so much effect to the struggle with fortune. When men will work but for four hours a-day, and that during only four days in the week, and want so little more than what bare nature gratuitously bestows as to be indifferent to those inducements which stimulate others to acts of exertion, they are altogether incapable of the results constituting the essential conditions of prosperity in the industrial contests of the present day. Those whose natural constitution is such as to enable them to support the fatigues of toil under the exhausting influences of a tropical climate, are by the same cause disqualified to become competitors in the cheap production of the demands of trade or manufactures with either Europeans, with those of European temperament, or with coerced slaves of their own can-but-wont-work race; and hence, as labourers, that numerous class of the population of the West Indies which is poor and unemployed is, it is to be feared, almost wholly unavailable for the exigencies of the case treated on the principle of commercial remuneration. The characteristics both of the native and coolie are discouraging and untractable. To a very injurious and fatal extent the same objections have operated on the profitable culture of the article throughout our Oriental Empire. Meanwhile the great Western Continent springs up, and with its many local advantages and its forced labour, triumphantly disputes the old-established claims of the East.

There are two species of cotton cultivated in India, whose nature is indigenous, besides the one transplanted from America; but the various experiments in relation to both, which have been made with a view to increase the yield, and improve the texture of the wool, seem to establish the conclusion that for the interests of the grower the exotic is in both these respects quite 25 per cent. more valuable than the indigenous plant. Almost the whole of the cotton which comes from this country belongs to the short-stapled class, and from imperfections in cleaning and rough handling in transmitting, suffers a depreciation in the Liverpool market, which could certainly without much difficulty be rectified. Some of the finest Indian cotton wool possesses a natural fibre so extremely delicate, that until our improved machinery for carding enabled us to work it into a state fit for spinning, it was utterly useless to our manufacturers. Among these may be mentioned the Bourbon, which formerly ranked high, and was much cultivated; but of late years, in deference to the superior claims of the Sea Island, its production has considerably slackened, and its importation into England is now in quantities of relative insignificance. Very recently, however, this source of supply appears to have undergone some stimulation, even greater than can be accounted for by the unusually prolific character of the last season; for, comparing the first three months of the present year with those of 1860, Bourbon has shipped off 250,000 bales in excess. However, so short and dirty are the fibres of most of the wools coming from India, that the delicate fingers of the Hindoo female can alone manipulate with advantage upon them. Of this nature is the Surat—pre-eminently. It is classed among the worst imported. The Madras and Bengal are scarcely better; so that, upon the whole, the Levant cottons, which take so low a position, are for the finer purposes of the manufacturer, superior to what at present our great Eastern Empire despatches for the necessities of the mother country; that great Eastern Empire, with its immense extent of districts—Coimbatore, Madura, and Tinnevelley, over which

the hand of Nature has so lavishly scattered her gifts, and where British wealth and intelligence exert so much of their powerful and life-giving influence. It is indeed mortifying to find how greatly this inferiority is attributable to causes which have, as I have hinted, their easy and simple remedies. Then, again, until the improved method of cotton culture in India can be made to appear as remunerative as that of indigo, sugar, and grain; until a system of irrigation has been completely effected, and economical means of transportation to the sea-board (which on an average implies a distance of from 100 to 300 miles) have been devised, to turn the attention practically to ginning and cleaning, packing and carrying, is perhaps somewhat premature. Although, doubtless, the last of these objects will in some measure be achieved by a further development of the system of railways now in rapid progress, a cheaper mode of transit seems necessary to enable the Indian grower to compete upon fair terms with the Western world. The Americans send down their corn and cotton by the Mississippi, one thousand miles, at one-twentieth the cost of railway carriage. Look at the only machinery for the conveyance of the precious burden now existing in India, and contrast it with the unapproachable advantages just mentioned. A country cart and pack bullock, or, as the case may be, a pack-horse but little swifter than a bullock, travelling along a rough track which admits of a speed of not more than from two and a half to three miles per hour. The charge made for this means of transport is not, as might be expected, absolutely heavy, but it adds, nevertheless, very materially to the selling price of the cotton when arrived in Liverpool, and causes grave inconvenience on the score of delay. With respect to the former, it has been calculated that on Indian cotton two-thirds of its value, as paid by the English purchaser, goes to defray the cost of transport in and from the country producing it. The Great Indian Peninsular has proved itself the first railway company to introduce into an Indian cotton district the peculiar facilities of its system of intercommunication. With the slight exception of an interruption of nine miles at the Thull Ghât, there now exists a continuous line of 107 miles, extending from Bombay to the vicinity of the cotton plantations of Berar. Then, if cotton is to come down the Ganges, much embarrassment is occasioned by the paucity of steam-vessels and the consequent uncertainty attending its shipment. In the absence of this mode of conveyance, barges, impelled by one large square-sail, are frequently resorted to, but with a reluctance which their ricketty condition and the inefficient crews with which they are manned account for without further explanation. The indolence and carelessness of the parties to whom the merchandise is by this method consigned, generally levy in effect a heavy penalty of risks and losses upon the exporters (a distinct class from the growers), as the price of their imprudence. A slow way and a sure way have no natural alliance in this instance, for as the barges, never very safe, are on these occasions always overloaded, and accordingly very dangerous, the cotton not unfrequently suffers shipwreck; and even if so fortunate as to escape this calamity, the damage it sustains is more or less serious in regard to its market value. This disparity in the whole freight, as between India and America, is a question in which the success of enterprise in the East is very chiefly involved. It has been calculated that, whereas from America this charge upon the article varies between ½*d.* and ⅞ of a penny per lb., the expense incurred in this way between Madras and Liverpool, should be reckoned at a minimum of 1*d.*

For complete success in furthering the conduct of this distant traffic, nothing is more desirable than the annihilation of as much space as modern resources can at their utmost accomplish. The six or eight months elapsing between the purchase of the commodity in India and its arrival in England, involves the chances of such fluctuations in the home market as subject the buyer in India to the liability of very grievous loss. And, principally in consequence of the American monopoly, these oscillations in price are enormous—sometimes 50 per cent.; a variation which a more extended field of supply would effectually check and regulate. Hence it is thought by many that a joint-stock company, or some large capitalist, could alone prove equal to confront this shock of fluctuations—fluctuations so liable eventually to terminate in difficulties which, though perchance only temporary, might press too heavily to be resisted. A certain amount of risk might be run by the Manchester manufacturers, and the impulse given to the production of cotton wool in India would recoil advantageously on those who imported it. The cultivators, speculating for the general good, would like to pre-arrange a remunerative price without reference to the vicissitudes of the home market, and be thus freed from that damping, deadening, paralysing condition which enjoins them to send their cotton some thousands of miles, and receive for it just what the prices ruling in the Liverpool market shall at the moment determine. This is certainly the normal principle of trade; but might not India, under the peculiar circumstances of the case, be for the moment dealt with exceptionally? It is perhaps true, that so long as American cotton does not sink below 4*d.* per lb. in Liverpool, India can compete with Transatlantic producers. But it is well known that samples of good Indian cotton have brought as much as 5*d.* per lb. in our markets, though at times when the best American staples were selling at 1*s.* and 1*s.* 2*d.*; so that, assuming that the superior quality of the latter will doubtless always give them the leading place in the price-list, it is more than probable that the demand for inferior sorts at 4*d.* or 5*d.* may be, upon the whole, sufficiently steady to encourage the enterprising to make every exertion on behalf of our eligible Eastern dominions, whose growers can contrive to dispose of their produce profitably at this moderate rate. India has certainly every right to be regarded not only as the mother of the manufacture, but as the parent soil upon which this celebrated shrub was originally reared and propagated. The backward position she at present occupies in regard to the quality of

her cotton wool, arises mainly from the indiscretion of the residents who were appointed by the late East India Company to superintend ostensibly the cultivation of the plant, but whose conduct practically had the effect of producing results exactly the reverse of their mission. They were an ignorant and inefficient class of men, and matters grew worse and worse under their supervisionary authority. Experiments which, in many instances, contained infallibly the germs of success, failed in their hands; and attempts to do what might have been performed with little difficulty were ere long abandoned in despair or disgust. Who could expect the natives, left to themselves, would prove competent to seize young America by the throat and cry—"Pay me that thou owest!"

All the cotton plantations in India are in the hands of natives; but fear not, gentle reader, I am about to enter into none of those interminable and complex disputes which have raged so violently among zemindars, ryots, factors, and agents. Neither have we time to examine the causes of that failure in which so often experiments in the improved culture of the plant have eventuated. Whilst in Bengal excessive moisture has been said to have spoiled their crops, in the north-western provinces excessive drought brought on the same disaster. American planters, fresh from the fields of Alabama, Florida, and the Carolinas, have invested their capital and devoted their energies, intellectual as well as physical, in furtherance of the Indian cotton cause, and whilst they have themselves found it to be, under existing circumstances, a very unprofitable occupation, and by no means an over-pleasant pastime, Sir John Lawrence, in raptures of delight, has grown cotton luxuriously in his garden in the Punjab, upon terms, too, so commercially advantageous, and with results so thoroughly satisfactory, that its remunerative cultivation and its capability of amelioration are placed beyond all reasonable doubt. The Chinese, who are hardly so particular as ourselves in the quality of their raw material, take a deal of cotton from India—not to make all the nankeen in the world, very much of which my reader may be surprised to hear is manufactured in England, and thence sent out to the land of its baptism—but for purposes of their own, into which, since we have learnt how to make nankeen and grow tired of it, we do not care to inquire. Now, in India, they produce much cotton wool and use but little. In 1847 the crop was utterly worthless for lack of roads by which it might have been conveyed to where it was wanted and would have been prized; and so great was the distress and discontent resulting from this state of things, that, to meet them, the land-tax was remitted though the cotton was lost. As the material may be purchased in India for 1½*d.* to 2*d.* per lb., temptations were not wanting to embark a little money and apply a little skill in establishing a factory at Madras or Calcutta, just to see how far they could go concurrently with the rest of the world in fabricating for themselves and for exportation. The languor of the native character soon proved the great obstacle to this achievement. After a few hours of activity, lassitude takes firm hold of the artisan, and he and the gang to which he is attached, give place to fresh hands which, in turn, are also rapidly exhausted and require the same relief and renovation. These coffee-coloured, sun-burnt, hot-blooded fellows are incapable of toil. It takes three or four of them to do the work of one silver-headed Saxon; and hence the yarn comes to a price as long as itself, and would weave into a very extravagant piece of ordinary cloth, much dearer, without being in any respect better, than what we manufacture at home. Some forty years since, when the distaff was first exchanged for the throstle and the mule-jenny, native factories existed which, in Madras only, produced goods to the value of some 100,000,000*l.*, but the importation of British cottons, with their recommendations of superior cheapness and quality, soon overwhelmed the straitened attempts of the Hindoos to struggle with their masters in a race depending so largely upon vigour and science. This miscarriage leaves the question between India and ourselves in this striking position. We bring our cotton staple 5000 miles from India and take it back that distance manufactured in the various forms required, and there sell it at a very considerably smaller figure than that at which the natives can buy the same article, grown, spun, and wove by themselves. It is fair, however, to confess that in the immediate neighbourhood of the spot where the cotton is reared, the yarns spun by the natives by the aid of mechanical power infinitely excel those produced in England with the same wool, in consequence of the great deterioration the raw material endures from packing and carriage. And now, in a few words having reference to the claims of the new Australian colony of Queensland, I will bring my remarks on this great subject to a close.

The climate of Queensland is perhaps the finest in Australia, and in character very strongly resembles that of Madeira. Yet it is remarkably well adapted to the cultivation of cotton, sugar, tobacco, indigo, coffee, rice, and other products of the earth which usually flourish under circumstances highly detrimental to the health of man and the conservation of human life. The soil, too, is all that could be desired, and the European constitution can as well support the exhausting effects of toil here as under European influences. The part of Queensland best fitted for the growth of cotton, is that east of what is called the Main Range. The river Darling, which gives its name to the Darling Downs,—a district regarded emphatically as the garden of Australia, where the land is rich and prolific, the supply of water regular and abundant, the climate moderate, the weather sufficiently constant, and the charms of nature spread around in every graceful variety,—could be made at a very small cost to open up some 5000 miles of country available for the production of the choicest kinds of this valuable textile. Several bales of Moreton Bay cotton have indeed already arrived in England, and the ablest judges, having valued them at very high prices, concur in advocating measures designed to promote a system of regular production. A somewhat peculiar and rare advantage resides in the climate of this district. It is free from anything like severe frost, and this absence

of an evil very pernicious to every variety of gossipium, imparts to the cotton plant of Queensland a perennial existence. Here is its paradise. The average yield has been estimated at 400lbs. per acre—mark, in India it is only 50lbs.—and the average value at 1*s.* 4*d.* per lb.; and in order to encourage this species of agricultural industry, the government of the colony offers a bonus of 10 acres of land for every bale of cotton of this first-class description, weighing 300 lbs.; all which furnishes data very capable of conducting to inferences of a most important and agreeable complexion, such as make the itching ears of the emigrant to tingle, and his empty mouth to water. I am almost resolved to take out my passage in the next ship sailing from Liverpool.

The most prominent feature in the whole economy of cotton husbandry, which is picking, viewed in relation to Queensland, loses all its formidable aspect. The three months during which this operation continues are May, June, and July, and these compose proverbially the most serene and salubrious of any similar portion of the year. Besides the country above alluded to, there are other immense tracts of alluvial lands on the banks of navigable rivers, and a vast extent of coast from Point Danger to Keppel Bay, embracing altogether many millions of acres, in all respects inviting to the intelligent and industrious emigrant, who with the smallest capital, and the fewest possible number of antecedents, might at once enjoy comfort and independence, and lay the foundation of future opulence. People at home, and people who go abroad, are equally interested in the truth of these facts. Brisbane, the metropolis of the new colony, contains already a population of 7000 souls, and is well stocked with all the necessaries, and many of the luxuries, both of the animal and spiritual life; for even spiritual life has its indulgences. Among things appertaining to the latter may be mentioned fourteen churches and chapels, of nearly as many denominations of religious belief as the sum will admit, a bishop of the English church, and priests of that of Rome being included. Agricultural pursuits are those which are engaged in most actively, and accordingly a demand for men with tastes and habits comporting with these callings is so general and continuous, that, *ceteris paribus*, agriculturists and field-labourers are the most certain to prosper. The remuneration for labour in general is handsome, taxation very light, provisions exceedingly cheap, and clothing, for a colony, not exorbitantly dear. I have only to add, that although I am not by any means an emigration agent, or, under all circumstances of pressure, a strenuous, out-and-out advocate for tempting fortune in another land; although I have no direct or indirect connection with the welfare and expansion of the colony of Queensland, or with any cotton consuming process, either at home or abroad; I should have no reason to regret the tendency of these remarks, if they turn the thoughts of any number of practical men to the subject of cotton-growing in regions apparently so suitable to the purpose—that grand and profitable purpose of multiplying material for the "silver tissue" which "clothes the world."

MISAPPLIED ORNAMENTATION.

THE decorative arts are, without doubt, making great progress in our country, and people are no longer satisfied with the plain humdrum style of ornamentation that satisfied our fathers. There was room for improvement, no doubt; clumsiness of old was the characteristic feature of all our designs—a clumsiness only second to that prevailing among the Dutch and German nations. But where is our modern fever for ornamention leading us? Entering my old parish church the other day after the restoration, I scarcely knew where I was. There used to stand in the chancel the Tables of the Law, done in very old-fashioned white letters on a black ground. When a child, I used to remark upon the plethoric character of the P's, and the B's, and the R's; but, with all those little old-fashioned imperfections, I could at least read the Commandments plain enough. But now all was altered. In place of the old turnpike-looking board, there was a page from some ancient missal—at least it looked like it. Each Commandment had its illuminated initial letter, and each letter was as unlike the old Roman character as a herald is from a Quaker. Here the tail of an R twisted itself round some distant member of the alphabet with the tenacity of a ring-tailed monkey; there something that looked like an S shot up into the air like a Gothic sky-rocket. It is, no doubt, very fine, and I can readily conceive that the letters are an exact copy of that invaluable MS. which St. Etheldreda spent her life in illuminating in the fifth century; but there was one little difficulty,—I could not read the Commandments thus got up in masquerade. The light was none of the brightest, it must be confessed, and Joseph done in deep purple, together with the Magi in ruby, standing on their toes in the true Byzantine style, as the curate informed me, probably had something to do with my want of clearness of vision. But, why should this over-ornamentation extend also to the service? There was a time when it was read in plain English, but we suppose that, with a love of uniformity, the vicar had ordered it to be intoned to match the illuminated Commandments; at all events, the flourishes and queer intonation given to the fine old English words were so successfully accomplished, that I really could not understand what was said. It was certainly a drawback to public worship, neither to be able to use my eyes nor my ears as I used to do; but, at least, I may pray in my old fashion, I said to myself; but I was reckoning without my host. The roomy old pews had given place to Gothic sittings, in which the agony of kneeling was so great that I could not help suspecting our worthy vicar contrived it with the idea of giving an expression to his congregation that should match the old gurgoyles that grinned upon us from the porch—at all events, prayer under such circumstances was totally out of the question, and I could not help thinking that the services of our modern church ornamenters had resulted in rendering impossible the service of God. But the evils of over-ornamentation are by no means confined to ecclesiastical furniture and decorations; it is spreading to our literature.

Happening to take up Gray's "Elegy in a Country Churchyard," that lay upon the table of a lady upon whom I was making a morning call, I was horrified to find it was printed in black-letter type, and was surrounded with an illuminated border, by Owen Jones, of so elaborate a character, that it was evident it was not intended that the poem should be read. The charming elegy which breathed the sacred calm of English life was stifled with oriental surroundings, which drive the mind far away from the text. What should we think if we saw one of Millais' heart-searching pictures plastered round with high-flown descriptions of its beauties? Why, that they were intolerable impertinences. I have the very highest respect for the genius of Owen Jones, but I fear even his artistic excellence will fail to add one charm to such a poem as the immortal "Elegy" of Gray. The sudden craze that has come upon us for decoration has, I fear, placed in the background that good sense for which at least Englishmen have been conspicuous. For a moment, we are losing that first canon of all beauty, the sense of fitness. Why is it that a piece of good English machinery is always pleasing to the eye of the artist? Because every part of it is designed with exquisite simplicity to perform its given function. We never see strong beams and pillars covered over with gilding and painting, and scrolled with Louis Quatorze work, as we do in American machinery; for the object is not to impress the mind with a sense of prettiness, but with that of strength; and this our English good sense obtains by simply not striving to make the thing look what it is not. What we wish to see preserved in the midst of the arts of design, now making such progress throughout the land, is this appreciation of the sense of fitness. Not many years ago the Society of Arts gave a prize for a set of tea things. The design was classical, and certainly very pretty, but usefulness was entirely sacrificed to it. The milk-jug was so narrow in the neck, that the hand never could get inside it to wash it out. The sugar-basin was a charming little object, but it required filling two or three times for a moderate company: the cups again were too small and fragile for English habits; and so the prize model got laughed at, and had no earthly influence in reforming the old designs for our tea services, which, however inelegant, had at least the merit of suiting the habits of the people; and there is a good deal in this. We shall never take to Greek designs, simply because we do not possess the old Greek appreciation of the beautiful to the exclusion of other qualities. We shall never take to a French style, as it is too frivolous for the national character. A few *petit maîtres* may rave about the lightness and elegance of the taste of our neighbours across the Channel, but the nation will never adopt their filigree work.

Moreover, there is a tendency in French designs to misapply ornament in a marked degree. How our collectors swear by Sèvres China. I was looking at a set the other day in the Soulages Collection, at the South Kensington Museum, and could not help being struck with the beauty of its form, colour, and texture; but there was a dessert service meant to be covered either with a D'Oily, or with fruit, enriched with the most exquisitely enamelled portraits of princes, warriors, and other famous men of France. If the reader will for a moment consider these little enamels as exquisite works of art, he will recognise the absurdity of making them the receptacle of melon rinds or peach skins. Pictures are intended to be looked at, and it is a gross violation of taste to make them subservient to an ignoble purpose. I have seen picture galleries on tea services from the same royal source, alike testifying to the perversion of taste which obtains in the most artistic atmosphere of that country, which boasts that it leads Europe in all refinements. Look again at the famed Pallissy ware. We see dishes filled with snakes, fish, and reptiles of all kinds. Now here we see an article of use so constructed that it cannot possibly be used. It would have been very simple to produce Pallissy china, of an artistic character, without associating it with culinary apparatus—it was a misapplication of art which cannot be defended.

Gavarni once observed to me, that what struck him on coming to this country was the size of its men and beasts, and the substantiality of all our appurtenances. Physically, as well as morally, we are a solid, large-limbed, large-thoughted people, and our art, to be national, must be in keeping with these manifestations of mind and matter. Our Elizabethan architecture was a very barbarous thing compared with the Cinque-cento style, its Italian contemporary, but we contend that it was a truer style for Englishmen, because it reflected the florid, large, rough manners of the period better than would the delicate subtle spirit that ran through the Italian work of the same age. The various schools of design, now educating our young people in the ornamental arts, very properly direct their pupils' attention to copying Nature. By this means we shall, in the course of time, work out a style of our own which is truly national. In painting and poetry, the drama and gardening, we possess an individuality which other nations recognise, but as yet we have possessed no natural style of ornamentation, for the sole reason, as far as we can see, that we have never systematically devoted our attention to the subject, but have been content to copy those of other nations in the most servile manner. At the very foundation of all national design, lies strongly marked national character, and this we possess. We also possess the imaginative qualities in the highest degree as witness the famous roll of our poets; and to say that we cannot impress these qualities on inanimate nature is to assert an absurdity. The English of the next century will, we believe, be an art-loving people, and the demand will call forth the supply with certainty. Meanwhile we must, we suppose, submit to see taste outraged by the extravagances called forth as a reaction from that old Quakerish baldness of ornamentation which has satisfied us for so many generations. A. W.

BUSINESS WITH BOKES.

We are told that we may know men by their friends. But suppose they have no friends? How is it possible in that desperate case to arrive at

a correct estimation of our fellow-creatures? Well, I think that we may know men by their waistcoats, by their shirt-collars, by their whiskers, by their books, by their furniture, by their surroundings generally.

Now, Tom Lupthorpe, in connection with whom I am about to relate certain facts, *had* friends. For instance, Budder was one of them: Crickson was another: I was a third. No doubt, therefore, it was open to the critical observer by taking account of Budder, and Crickson, and myself, or somehow by adding us together, and dividing the total by three, to regard the result, or average, so obtained, as a fair valuation of Tom Lupthorpe. But I think that an estimate of equal correctness might have been reached by a less complicated method. I may be led to this opinion, perhaps, by an inclination to shrink from arithmetical effort, which, as it is purely natural and constitutional, and quite out of my control, I have no hesitation in avowing. By no process of calculation could I ever persuade a sum of addition, however simple bystanders may have chosen to call it, to yield a correct product, or one that did not singularly vary upon each occasion of my testing it. Consequently I should have preferred to derive my appreciation of my friend's character from other sources. I should have put Budder on one side, and Crickson, and myself, and have set to work to study Tom Lupthorpe, quite as an isolated subject. I should have held a severe inquest upon his personal appearance, his manners, and dress. And certainly my friend betrayed himself abundantly in these matters. His was not an involved character; his idiosyncrasy presented few remarkable traits. A foundation of admirable amiability and geniality of disposition, and reared upon this a rather rickety mental edifice; extreme irresoluteness, much vacillation of purpose: a mind of a sort of putty material, which could be pinched, and pressed, and kneaded into almost any shape the operator might fancy. And this much was surely perceptible, even upon a cursory examination; for, indeed, in the most trivial affairs of life his want of decision was demonstrated; in the brushing of his hair, the cut of his beard, the fashion of his necktie. He never could resolve definitively as to the side of his head on which he would draw the conventional line of division of his hair. He never knew exactly whether he would wear his straggling straw-coloured moustache with the ends turned up defiantly, or down pensively; and, as often as not, in his indecision, had one up and one down, like a railway semaphore signalling the approach of a train; whether he would denude his chin with his razor, or clothe it with a beard, now to be worn long and streaming, now short, sharp, and pointed; now a thick, bushy, blunt spade form; now pared away to a mere comma or sedilla on his lower jaw, which receded of course; or where would physiognomy be in respect to men of feeble volitions? He had always found much difficulty in the proceeding known as making up his mind. Perhaps, altogether, this gave rather a pleasantly helpless and benignly imbecile expression to his face. He had made, of course, two or three false starts in life. The wonder was that he had ever "got off," as the phrase is, at all. At the time I first knew him, he was an artist, occupying a second floor in a small street turning out of the upper end of Tottenham Court Road. I believe he had been originally destined for the church; had lurched towards the army, was found for a short time stranded on a high stool in a lawyer's office, was next said to be reading hard for the bar, and then was suddenly discovered to be a painter, following no particular line of art, but in a sort of irregular service, struggling on a plan of his own, independently of any one else, and in defiance of all rules and precedents. Not from any over muscularity of his mind prescribing for him a particular career of informal action, but simply because in his irresoluteness he was turned and twisted by every gale that blew, carried away by any chance current that came near him. He had commenced with a success in portraiture, then had developed a passion for landscape, had burst out with a grand historical work, and then had suddenly subsided into *genre*, with a suspicion enduring the while that he might at any time revert to the former branches of his profession: like a squirrel leaping in a tree, his movements seemed to be entirely without method, and could not possibly be predicted. I am bound to say, however, that he had very considerable art-talent, and though his works were rather indications than developed proofs of this, they were, nevertheless, very charming, and might have been of much more commercial advantage to him than his want of judicious dealing with them would permit them to be.

"How are you, Lupthorpe?"

"Hard up. That is, I have been; as hard up this morning for five shillings, as I should think a fellow ever was. However, it's all right now."

"Where's that pretty little sketch you made in Epping Forest?" I asked, as I looked round the studio. It had been a favourite drawing of mine, and it generally rested on the mantel-piece, and I always went straightway to contemplate it whenever I called on Lupthorpe. I may say here that his was not by any means a comfortable studio; it was, like its tenant, so wanting in decision of character. It looked as though at one time it had wanted to become a drawing-room, and then before it could bring that idea to maturity it had abandoned it in favour of being a bed-room, ultimately to revert again to its old studio destiny. Thus, a loo-table, with an ornamental cover, stood in one corner of the room; in another a washing-stand painted to resemble an upholsterer's notion of bamboo, that is to say, a bright yellow colour, with here and there mysterious brown dabs and lines, and speckles. Of course, the washing-stand flatly contradicted the loo-table, and at direct issue with both of these were the easels, and the paint boxes, and the groups of boards and canvases leaning against the wall. The effect was embarrassing to the visitor, who was always torn with doubts as to how he ought to behave himself, and whether it could possibly be permissible to smoke.

"Where's the Epping Forest sketch?"

"I've sold it. To Moss Bokes. For five shillings."

He jerked out the words with evident effort, as though he did not like parting with them.

"For five shillings? Why it was well worth five pounds, if not ten!"

"Do you think so?" he asked, meekly.

"Oh! no," cried some one in the depth of shadow of the window, the half of which was covered to exclude the light, "it vas only vorth a crown, vorth vot I give for it, not a farding more. A poor little thing. I shall have a hard job to sell it agin, and get my money back."

Moss Bokes was the speaker. I could see him now standing behind Lupthorpe, and if I could not have seen him I should have recognised him by his voice. For there was no mistaking Moss Bokes's voice. It had all the peculiarities of his nation. Need I say that the purchaser of Lupthorpe's "Epping Forest," for five shillings, was of what is called the Jewish persuasion? The voice evidenced the ordinary stoppage in his nose—(it was a roomy-looking and largely moulded nose, too, and was not so ornamentally formed but what it might have been useful)—and seemed influenced by a perennial cold in his head, and it had the usual husky gutturalness and indistinctness which may proceed from labial peculiarities or lingual excess of size. An anatomical question here presents itself, upon which I hardly feel justified in entering: the reader who has ever talked with one of Mr. Bokes's nation will understand the kind of voice I desire to describe; if not, he has only to listen to the persuasive tones of the next crier of "Old Clo'!" who passes down his street, to be thoroughly acquainted with it. A small old man, with a hat much too large for him, and a thick stock of dusky black silk round his neck, fastened with a huge buckle at the back—a stock of so ample a circumference that he could avail himself of it easily, if necessary, to withdraw his chin and almost his nose from public view. In fact, it always seemed to me that by pulling his stock well up and his hat well down, Bokes could have, at any moment, rendered himself invisible so far as his face was concerned. A dusty olive-green coat of remote antiquity, high in the collar, short in the waist, and long in the skirt; thin sallow claw-like hands, that were generally either buried in his pockets or concealed by overhanging cuffs; a stunted beard of rather a patchy piebald aspect—here orange, there grisly grey—there quite white; prominent green eyes with a glassy glitter in them; and I think I have catalogued the specialities of Mr. Bokes's appearance.

"A poor little thing! Vot am I to do vith it now I got it? Who'll buy it of me I should like to know? I don't know no one. But I'm so veak; there's vhere it ish. I'm so veak, 'specially when a gent says to me, 'Bokes,' says he, or 'Mossy,' if he's more intimate, 'buy a picture of us?' vhy, I buys it right off. I'm so veak, and loses no end of money by it; that's me all over, that is."

He gesticulated violently as he spoke, and smiled and chuckled, and put his head on one side, and shrugged his shoulders, and meanwhile held his purchase tight under his arm.

"I never thought, Lup, that you'd have sold it for such a figure as that," I said.

"No!" cried Bokes, exultingly, "else you'd have bought it yourself. Vouldn't you now?"

"Well, I don't buy pictures——"

"No. You sells them; and sellers alvays vants to keep up prices, don't they?" and Mr. Bokes laughed loudly, stamping on the floor in his merriment. May I avow that I, at that moment, felt a passionate longing to "bonnet" Bokes where he stood, as violently as might be. I resisted that longing and overcame it. I hardly know now whether I am glad or sorry that I did so. I turned to Lupthorpe.

"That's a pretty thing you're painting there, Lup."

"Do you think so? I hardly know what to make of it yet; or what it means, quite. Can you give us a name for it?"

"Call it Paul and Virginia," interrupted Bokes, "that's a good selling name."

"Don't be absurd, Bokes. You know it won't do for that."

"Well, vasn't I advising you against my own interest? Put a little more brown on the boy's face, and it'll do very vell."

"I was thinking of Lorenzo and Isabella—that might do?" said Lupthorpe, turning his puzzled-looking face to me, "or Lorenzo and Jessica,—or Romeo and Juliet,—or Claudio and Isabella,—or Claudio and Hero,—or Hero and Leander—no, that wouldn't do. Dear me. How difficult it is to find a good name for a picture."

"What's that sketch over there?"

"O, I designed that for a large picture as big as that side of the room, a Jael and Sisera, or a Judith and Holofernes, I don't know which it will be. Crickson, who was here the other day, advised me to make it a Samson and Dalilah, or if not that, a Charlotte Corday and Marat. You see it would come very well for any one of them."

"I'll buy it, I'll buy it," cried Bokes; "what shall we say for this pretty little thing?" and he brought out a handful of silver from his pocket and began to swing it about before us. "I don't bear no malice," he said, "I'll trade with you; let me do a deal with you—*do*. What shall we say?—one half-crown, two half-crowns, three half-crowns—four; do let me do a deal with you, Tom, my boy."

"No, Mr. Bokes," I said to him, sternly, "we'll have no more dealings here at present. You've done too good a morning's work as it is."

"To think of saying that now," cried the Jew, in a tone of expostulation. "Suppose I'd bought it—the poor little thing! Vot should I have done vith it? I don't know, no more than the dead. But I'm so veak—there's vere it is—so veak!"

"How can I help it?" asked Lupthorpe, piteously, after the Jew had gone, in answer to my regrets on the loss of Epping Forest. "He would have it you know, and I don't know how much things are worth. Well, it does seem a poor price certainly, as you say; but I *did* want five shillings rather badly, and then—and then—you know—Bokes isn't such a bad sort of fellow after all. I wish though he wouldn't call me Tom. I do wish that. It does *not* sound well."

"You've sold him a good many things, haven't you, Lup?"

"Well, I have, at poor prices certainly, I must admit. But what can I do? He comes here, and talks, and stands at the back of me, and says, 'Well, that is a poor little thing you're painting there—that is—and no mistake—a very poor little thing. What do you expect you'll ever do with that? You'll never sell it, you know, never,' and so on, and a cold shiver seems to come over me, and I begin to think it *is* rather a twopenny sort of thing I'm at work on, and then he gets rattling his money about in his pockets ever so much—and then he says, 'A crown. I wouldn't mind giving a crown, though it's more than it's worth, and I shall never get my money again, never,' and then he brings out half-crowns, and flings them up in the air, and catches them, and chinks them together, and drops them on the floor, and they roll over my feet and settle down right before me; and I begin to think I *do* want a few shillings rather badly—and—and it ends in his taking off the picture at his own price."

"And his selling it for fifty times as much."

"Do you think so, really? Well, he says not."

A burly red-cheeked gentleman strode into the studio. He looked more like a farmer than an artist; still he was one.

"How are you two fellows?" He had a grand, loud, hearty, healthy voice, full-flavoured, and with plenty of body in it, as some merchants say of port. Eminently a strong, stout man's voice.

"Hullo, Crickson. Did you meet Bokes?"

"Bokes? *Connais pas* Bokes (Crickson had studied in French *ateliers* evidently), and don't want to. I've heard of him, though: a dealer? of course. No. We've got our own vampire at Camden Town. I should like to see Bokes come on *his* beat."

Painters are always gregarious. They all love to establish distinct *quartiers* of their own. Wherever you find one you may be sure there are plenty more not far off. They don't live as single figures, but compose themselves into groups. Hence art colonies are established in various parts of the town; one at Camden Town; one at Pimlico; one at Bayswater; with always the old parent stock near Fitzroy Square; to say nothing of a snug little branch settlement near Langham Church. Crickson was of the Camden Town migration.

"What are you painting, Lup? Lord Leicester and Miss Robsart? or the Earl of Surrey and the Fair Geraldine? or Shakspere and Ann Hathaway before they were married?"

"Thank you, Crickson, those are very good names. I'm sure I don't know which to choose. Do you like it? It's a mere sketch, you know, and I've had very little nature for it at present."

"Yes, it's very nice. I think there's rather shaky drawing about that knee, though, old fellow, and you *have* got some queer colour in the girl's hair."

"What do you think I ought to ask for it?"

"Ask anything you like, and you're sure to get it. All that's wanted in these matters is confidence—or *cheek*, if you think that's a better word. And I'm not at all sure that it isn't. Why, I was twelve hours the other day wrangling about price with a fellow down Camden Town way. And then at last we stood ten shillings off each other. I offered to fight him for the difference, or to wrestle him for it, or to walk him for it, or run, or hop, or swim, or row him for it. Still we couldn't come to terms. Then I lost my temper and threatened to throw him out of window, and the sneak, would you believe it? he gave in. I haven't done a stroke of work since, and shan't till the money's all gone. It has nearly."

Crickson was rather like that pupil of Berghem's named Theodore Visscher, who we are told disdained to carry his stock of money in his pockets, but always walked about with it in his hands, notifying his possession of it thus simply to his companions, and carousing with them until all was expended.

We told him about Bokes.

"Five shillings for that lovely little study. My eyes! what a shame. Why, Lup, you are the dearest old flat that ever lived, I do believe! I tell you what I was thinking of doing with our Camden Town vampire the next time I have a deal with him. I was reading the other day—was it Roman or Grecian history? Have you got a Pinnock, Lup?"

"Yes, I think I have somewhere, a geography."

"Ah, that won't do. Well you know what I mean—about that old woman the Sybil, you know, who offered the books to the fellow to buy, and when he wouldn't trade with her, went home and burnt some of them, and then offered to sell him the rest at the same price—or was it double? I forget which; and went on burning and offering to sell the rest, until the fellow bought them of her at her own figure. You know what I mean. Well, I intend to pursue the same course with my next picture."

"What! Burn half of it?" cried Lupthorpe, alarmedly.

"Well, no, not that so much as asking double for it, every day, until the dealer buys it at last. And he's sure to, you mark my words. Name your price and don't flinch from it—rather increase than decrease—and you'll get it, you're sure to. These men mean buying, sir, it's their trade; they *must* buy—they can't help it—and you can get out of them any price you like if you only know how to set about it. Ask a hundred of Bokes for that, and you'll get it—you see if you don't; only persist in it, stick to the hundred, threaten to make it a hundred and fifty if he's obstinate; tell him you'd sooner put your foot through it, or put it on the fire, than let it go for less, and you'll get your price at last—only see if you don't. When does Bokes come here again?"

"He generally looks in on Mondays."

"He's made a good thing out of you, Lup. It's time you should make something out of him. Mind now you don't go selling him anything more without letting me know. Promise it."

"Well, I'll try not to," said Lupthorpe, with much self-distrust.

A fortnight and great progress had been made with the picture. Hugo and Parasina it was finally named. I believe there were a few anachronisms in the matter of costume, but then these are usual in paintings. Mobbs (late of the

10th Hussars) had been sitting for Hugo, and pretty Miss Briggs (of Upper Paradise Place, Hampstead Road, top bell and a single knock, please), had posed for Parasina. It was decidedly a very admirable work, and did Lupthorpe infinite credit. Soon, it was finished.

"Itsh pretty; yes, itsh pretty. But it ishn't much. I wouldn't mind a tenner. Vat do you say Tom, my tear, a tenner—think of that." And Mr. Bokes waved a Bank of England note in the air.

"Think of Crickson," I whispered to Lup, for I saw he was yielding.

"Fifteen, then; come, twenty; there, twenty-five; I can't say fairer." It was evident that Bokes wanted the picture very badly.

"Am I right?" asked a bland voice at the door. "*Is* this Mr. Lupthorpe's? I think the name is Lupthorpe. Oh, this *is* Mr. Lupthorpe's. Thank you."

An elderly gentleman, with smooth grey hair, and gold-rimmed spectacles, and a white neckerchief, a most respectable looking gentleman, clothed in a shiny suit of black, entered the room; he felt in his pockets for a letter. He produced and read it. He addressed himself to me in the first instance, mistaking me for Lupthorpe. I set him right.

"I am commissioned, sir," he said, "as the London agent of" (he mentioned a name greatly venerated in studios, the name of a large purchaser of works of art, let us call him Smith of Manchester) "as the London agent of Mr. Smith of Manchester, to make an offer for a picture in your studio, called, I believe, Hugo and Parasina."

"Indeed!" said the aghast Lupthorpe.

"Close with me, my tear boy," whispered Bokes. "Thirty-seven pund ten; forty, there!"

"My instructions will prevent my offering more than a hundred pounds for the picture," said the London agent of Mr. Smith of Manchester.

"A hundred pounds!" cried the Jew.

"I have the money with me," said the agent, putting his hand in his pocket.

"So have I; so have I," cried Moss Bokes. "Guineas. I'll give guineas; take the money, my tear Tom, you'll sell to me in preference to a stranger, von't you, now? Ah! that's right!"

The bland agent expressed his regret that he could make no advance on his offer. So Lupthorpe closed with the Jew, and gave him a receipt for the money as the agent left the room. Mr. Bokes nearly cried as he brought out the money—in gold, notes, silver, partly even in half-pence; then he danced round the picture and gazed into it; nearly colouring his nose with the wet paint, he inspected it so closely, and his green eyes sparkling with joy; then he subsided into an assumed despondency.

"A lot of money! I shall never see it again. Never! And what shall I do with this poor little pictur now that I've got it? Dear me! it will be a dead loss to me. But I am so veak, so precious veak! There's vhere it is. I always vas!" And he went off in a cab, with Hugo and Parasina on the seat opposite to him.

"Well, that's the best business I think I ever did with Bokes!" cried Lupthorpe, with elation, after the door had closed upon the Jew. "A hundred guineas for that little picture is really a very respectable price. I should have liked, though, rather to have sold it to Smith of Manchester. It would have been a good thing to have commenced a connexion with Smith of Manchester. Only Bokes *was* so pressing."

Just then Mr. Smith's agent re-entered the room. He stared at us curiously, and then commenced tearing off his white neckerchief, flinging a grey wig and a pair of gold rimmed spectacles into the middle of the room, and capering round them extravagantly. It was Crickson!

"I consider that a very neat piece of acting," he said; "and I think I circumnavigated Bokes in rather a superior manner. Lup, I congratulate you. You've made a good thing out of Bokes at last. Thanks to me. It was a grand idea. I shall get one of you fellows to try the same trick on with our Camden Town vampire."

"Then, Smith of Manchester," Lupthorpe began, in a disappointed tone—

"All a delusion, my dear Lup. He doesn't want Hugo and Parasina, and wouldn't give you a hundred pounds for them, so far as I know, any more than I would—and now I suppose some one will give me something to drink, for picture buying is very dry work,"—and Mr. Crickson began to amuse himself with a tumbler.

In the evening Budder called. He was always welcome to Lupthorpe's studio; and indeed, at a good many other studios. We were sitting round the fire, and some of us were smoking, and there was a strong odour of whiskey and hot water in the room, which some of us must have been drinking. At this distance of time I may be forgiven for not remembering precisely who it must have been.

Budder was not an artist. He was an articled clerk in the firm of Blinker, Jugman, and Moggles, Austin Friars, City; and what with his official duties, bitter ale at all times of the day, late hours, reading law books while he drank cold green tea, and sat with a wet towel wrapped round his head, like a turbaned Turk who had been pumped upon, preparing for his examination, he had rather a pale and uncomfortable appearance, and had the coldest and flabbiest hands I ever met with—shaking hands with him was something like taking hold of the tail of a dead cod-fish.

He knew nothing about art, though he had many friends among the artists. But after all, friendship is just as unreasonable as love. Perhaps in both it is best to begin with a little aversion. How is it that men, with diametrically opposed minds, are always such fast friends with each other? Ideal poets cling to anatomical professors. Visionary politicians are fast allies of analytical chemists. We artists were cleaving to a lawyer.

Not, after all, that Budder was much of a lawyer really, though undoubtedly he seemed so to us. Upon reflection, I think now that though he is an unquestionable authority upon fly-fishing, and pigeon shooting, and bagatelle even—and I should not hesitate to accept a dictum of his upon any of these heads as quite final—he is perhaps

the last man I should go to for a decision upon a strictly legal question.

We put him in possession of the story of our business with Bokes. He smoked over it a pipe of the very strongest tobacco I should think procurable anywhere. Somehow, he did not appear to enjoy the narrative so highly as we had expected; on the contrary, he grew very solemn over it.

"Perhaps you're not aware of it," he said, at last, in an awful voice, dividing his words so that they might fall like distinct and individual blows upon us. "Perhaps you are none of you aware of it; but you've all been guilty of an offence—I should say clearly indictable at common law. You, Lupthorpe, of fraud and covin."

"Oh Lor!" cried Lup, in an agony, "what's covin?" But Budder did not heed him. He went on as though he had been a chief justice, with the black cap on, condemning a batch of convicts to extreme penalties.

"You other two have been guilty of conspiracy, or perhaps misprision of felony, or you may be charged with vagrancy and disorderly conduct. I was reading up the subject only last night, but I hardly know upon which I should go against you.',

(See page 248.)

He certainly dwindled here from the chief justice into the articled clerk again—and then he communed with himself, contemplating the ceiling. "No. I don't think it's *crimen læsæ majestatis*," he went on; "the punishment might be transportation for two years, or perhaps penal servitude; or if the thing came before the sessions, perhaps imprisonment and hard labour for one year, with whipping, except in the case of females." (What was *crimen læsæ majestatis?* Did Budder really know? or was he only seeking to impress us?)

"Oh please, sir, let us off: we'll never do it again—please, sir!" cried Crickson, with what I must really denounce as ill-timed humour.

"This is awful," cried Lupthorpe, his face quite white; "fancy being dragged along the streets by policemen—the crowd hurraing—then before a magistrate—"

"The scene would paint very well," said Crickson, meditatively. He was an artist always—even if he was to be regarded as a felon.

"Fancy its being put into the papers, and their getting hold of it down at the Rectory. I do think it would kill my poor old governor. Hard labour for one year! Oh Lor! with whipping—"

"Except in the case of females," interpolated Budder.

"What would you advise us to do, Budder? *Do* tell us. *Do* help a fellow in his trouble!" cried Lupthorpe.

"Give back the money. Make peace with Bokes. Give him double the money if need be."

"Where's one to get double the money from?" growled Crickson.

"Won't that be compounding a felony?" I asked, with a dim notion that I had heard of some such thing before.

"That's Bokes's look-out," replied Budder, trenchantly.

For ten days poor Lupthorpe endured an agony which can be better imagined than described. The phrase is not original, I admit; but it is appropriate. If I knew the name of its author, I would frankly give it—but I do not know it.

He grew thin and pale, and intensely miserable. He was always putting problematical inquiries to his friends.

"I say, old fellow, suppose you're transported; they give you a ticket-of-leave, don't they, if you know your catechism and that? And you can come back to your friends, can't you, after a short time, and when your hair's grown all right again, you know? And, I say, do you think, supposing you were a returned convict, that people would come to you for their portraits? and could you sell your pictures, do you think? and would the Academy let you exhibit? Do you think if I were to cut off my moustache that the police would recognise me, and could I not dispute my identity and get off somehow that way?" and so on. Poor Lupthorpe!

We were comforting him as well as we could. —"There's been a dead schvindle here," said a well-known voice; "a dead schvindle."

We looked up. Moss Bokes stood before us, frowning grimly.

"How about Mr. Smith, of Manchester, and his London agent?" and he fixed his green eyes on Crickson. "There's been a dead schvindle here."

"There have been a good many swindles here altogether, Mr. Bokes," said Crickson, with a calmness that might be callousness, but which was anyhow enviable.

"Tom," said the Jew, pathetically, and he screwed up his face, trying, I fancy, to press a tear out of his green eyes, but he could not quite manage it; "I didn't think it of you. You knew how veak I vas, and you've used me cruel! But I've got a peeler below?" This could have been only to frighten us.

"Oh, Mr. Bokes, please don't!" cried Lupthorpe.

"Vill you give me back my money? Vill you deal with me fair in future? May I call you Tom?"

Lupthorpe shrieked affirmative replies to these inquiries.

"Vill you sell me Jael and Sisera—dirt cheap?" the Jew asked, eagerly. Before Lupthorpe could answer, the servant entered with a letter. It bore the Manchester post-mark. It ran thus:

Dear Sir,—I have bought of Mr. Bokes, a dealer, a picture painted by you—Hugo and Parisina—at the price of 150 guineas. He tells me you have a companion work of Jael and Sisera, and of this he speaks highly. I am willing to act upon his judgment, coupled with what I myself know of your works. Are you disposed to sell me the second picture at the same price I paid to Mr. Bokes for the first? An early answer will oblige,

Yours truly, John Smith.

Manchester.

"Is this really true," said Lupthorpe, wiping his face; "is it really Smith, of Manchester, this time?"

"It's quite true," said Crickson, after he had glanced at the letter. "I've sold to him, and know his handwriting: Jael and Sisera, a companion to Hugo and Parisina. Hurrah! how I love people who buy *pendant* pictures."

"Then you von't sell it to me now, I suppose?" said the Jew, humbly. "Ah, how you've trifled with my veakness."

"You didn't make a bad thing out of it though, Bokes," remarked Crickson. "Fifty guineas, that's a tidy profit on a hundred, I fancy."

"But you vill have another deal with me some day—von't you, Tom?" and Mr. Bokes writhed insinuatingly before him. Tom said he would, and the Jew took care he should act up to his word. In fact, he had dealings with us all afterwards. The system of waving about bank-notes and chinking gold disturbs the equanimity of the artist mind terribly.

"The Jew had a good cause of action," Budder sententiously commented upon the case, for as we had triumphed we were rather inclined to undervalue our friend's legal opinions; "if he chose to let it go, why of course that was his look-out. Well—thank you—I will, as you're so pressing. Yes, whiskey please—two lumps—thank you—and hot water. It's delicious. Your health, Lup, old boy, and good luck to your next picture."

We joined him in the sentiment, and in the drinking of it. Dutton Cook.

The Russian as a Shopkeeper.—Trade s the proper element of the Russian; it is his favourite pursuit, and should his trade even be confined to hazel nuts, he will devote his time and energy to it, with the same zeal as if he were engaged in commerce on a large scale. He is indefatigable in displaying all his goods before his customers, and is never offended even at the lowest offer. I once entered a hatter's shop at St. Petersburg, and asked the master to show me a hat. He took up one, turned it round and round on his hand, ejaculating: "*Votibi sladitshka na twoya galovitshka*," (here is a pretty neat hat for your pretty neat head), "and you would not mind to give 20 roubles banco (about 16*s.*) for it." I offered him 5 roubles, and was about to leave, when he detained me, saying: "Do not run away, we are not so very far asunder. Take a seat, and say really what you mean to give." I bought it at last, after much amicable bargaining, for half the price asked for. When the Dutch Jews once asked of Peter the Great permission to carry on their trade in Russia, for which privilege they offered him a considerable sum of money, he refused, saying, smilingly: "Keep your money, my friends, you won't find your account in Russia. One Russian is as cunning as four Jews." M.

THE SILVER CORD.

BY SHIRLEY BROOKS.

CHAPTER XCVI.

Two days passed, and Ernest Adair received no summons from the person to whom he had been directed to announce his arrival in England. This time he passed at the lodging he had taken, seldom venturing out, except to procure himself some of the minor luxuries to which one who has long resided on the Continent is accustomed, and which do not enter into the coarse calculations of a lodging-house keeper. A little fruit on his breakfast-table, a box of sardines, even a few flowers, were among the humble requirements of Adair, and his two-pennyworth of roses was arranged with as careful an attention to their grouping, as if the hand that set them out had been that of an innocent girl who varied her task with a song. Adair, too, varied his task with songs, but they were not such as a girl should sing, or hear. Their meaning, however, was, of course, lost upon the rest of the household, and the foreign gentleman was supposed to be rehearsing for his theatrical duties. He gave little trouble, smoked incessantly, and occupied himself with newspapers, which he bought in large numbers, and searched for paragraphs of foreign news, the nature of which, happily for the peace of those with whom he sojourned, came not within their homely imaginations. But he searched in vain.

A third day passed, and the monotony of Ernest's existence suddenly began to press upon him with a dead weight. Those who have lived a life of business, or of irritating excitement, have their moments of repose, when a species of almost defiant pleasure is found in the interval of stagnant inaction. But such persons, under such circumstances, not infrequently arouse to a feverish and despairing sensation, when the stillness of this life becomes intolerable, and even at the risk of destroying arranged schemes, or of running upon foreseen perils, they must do something to

satisfy or subdue the energies which revolt against repression. Prudence warns in vain, the blood flows hotly, and the brain works feverishly, and the swimmer who has drifted into one of the still pools of the stream of life, cannot bear to lie floating, but must strike out again into the torrent, though he well knows that his expected boat is yet far away, and that the current must whirl him along to perdition. Fortunate is the man on whom Nature at such an hour lays her restraining hand, and throws upon a bed of sickness, but this is a good fortune which, though it occurs with felicitous precision to the heroes of fiction, seldom occurs so opportunely in actual life. It came not to Ernest Adair, who, in full health and vigour, found himself suddenly doomed to tormenting inactivity, among those who were incapable of supplying him with society, and at whom he scoffed, perhaps instinctively rather than with malice, when exchanging with him the common-place civilities of their home, and of his hiding-place.

A fourth day passed, and Adair's loneliness, far more depressing than actual solitude would have been, became unbearable. On the night that Haureau had accosted him, Ernest had spent a couple of hours with a strange and coarse gang to whom the former had introduced him, and though Adair's dislike for such associates had made his conversation that evening one long sneer, except when in a sort of humorous despair, he had sought the applause of his companions by some wild outbreak of ribaldry, or worse, avenged on himself the next instant by a bitter self-loathing, even such society was better than none at all, or than the enduring the harmless platitudes of his new neighbours. He determined once more to visit the river-side haunt to which Haureau had taken him.

It was nearly dark when he summoned his landlady, informed her that business of importance took him into the city, and charged her to take the utmost care of any letter that might arrive.

"It's late hours for the city, sir, isn't it?" said the woman. "I thought that city gentlemen shut up early."

"Theatrical gentlemen do not, you know, Mrs. Wallis, and we must call on business men in the hours of business, talk business, and go about our business, that they may have time to attend to their business, as I see you have stuck up in your parlour."

"Well, to think that you should notice that, sir, and have a memory for it, too," replied Mrs. Wallis. "I do believe a memory is the gift of God."

"Do you?" said Adair. "Some people believe in an exactly opposite direction, but never mind that."

"No, sir, and I am sure I beg your pardon for taking the liberty of naming it. But would you mind taking the latch-key?"

"Not a bit, if you don't mind trusting me with it?"

"Oh, sir, anybody could see that you are a gentleman to be trusted, though, to speak the truth, we used to be set against mustaches, having been sufferers by the same, but everybody wears them now, and if persons were not intended to wear them, I suppose they wouldn't have been given. I tell my husband so, when he makes a piece of work if he can't find the halfpence to go round and be shaved, for shaving himself is what he never could and never did do, but he laughs, and says that the hair comes to help the barber to live, and so it does, if one looks at it in that way."

"Well, I am glad you look at mine in a favourable way, Mrs. Wallis, and I hope Mr. Wallis will not be jealous."

The good-natured woman laughed very heartily, had no doubt but that there was a younger and a prettier lady to think about Mr. Hyde's moustaches, gave him the latch-key, and promised that a candle should be left burning for him in the passage.

The candle burned out, but it outlasted the life of him for whom it was lighted.

Ernest Adair left the house, and, turning into one of the large thoroughfares, mounted upon an omnibus that was making its slow night progress towards the city. The vehicle was nearly empty, and proceeded at a funereal pace which once or twice elicited an imprecation from the only outside passenger. Yet, had he known it, his progress was fast enough for him. If there are intelligences, commissioned or volunteering to watch over the separate destiny of a mortal, and who have marked all his wanderings and circuitous journeyings in the world, seen him press eagerly forward when he should have tarried, and sit down, wearied, when a few vigorous steps would have given him the object of his blind quest, we may imagine them moved, either in pity or in mockery, when, for the last time, he exerts his boasted free-will, and addresses himself to the moral or the physical effort which is to carry him over one edge of the waiting grave. Is there a flutter of phantom wings, and a gaze of increased interest, as the spirits note the beginning of the end, or is the thought but one of the dreams which are to be scared from each and all of us when the hour of waking comes?

Late into the night was prolonged the orgy in the haunt by the river. The room was long and low, and heavy beams upheld the house above it. The old-fashioned windows, strongly made and fitted with small panes, told that several generations had drunk under the beams, and had, each in its turn, been pityingly spoken of by enlightened successors, the newest series of whom was then pitying its fathers, and hastening to be pitied by its children. But there was no special feature that distinguished the dingy room from many another in the neighbourhood. Its dented tables and sawdusted floor were like those of a score of hostelries within reach, nor was it a special haunt of evil-doers. Very good and jolly fellows, mostly connected in some way with shipping, or with the commerce that creates it, had passed many jovial and blameless hours there, kind and honest greetings had been exchanged in homely language over the liquors of the place, many a good voyage on the sea had been honestly wished, and many a loved and loving woman, wife or sweetheart, had

been toasted there with words that might have brought a tear to her eye, but not a blush to her cheek. And many a group of scoundrels had also met in that room, where the worst of them had spoken in low voices which no excitement of drink could elevate into manly freedom, and others, perhaps not the worst, had given vile toasts and shouted vile songs, and all had reeled away, making uncertain progress through the street, but certain and measured advance towards the Devil.

Perhaps no worse group had ever occupied the room than those gathered round a table in a corner-box on the night of Adair's second visit. There were five or six men, foreigners, but whose nationality it would have been hard to define. Their costumes were not squalid, but incongruous, and it seemed as if each had bought some one new and good garment, when he happened to have the means, without reference to the rest of his dress. The handsome coat of one man half covered a wretchedly threadbare vest, while the showy waistcoat of a second shamed the poverty of his other clothes, and the nether man presented similar contrasts. Some of them wore jewellery, which looked good, and as if it had been procured as a safe and portable investment against a time of need, but one or two had no such adornments on their persons. The faces of the party seemed at first to bear a strong family likeness, and it was not until one had observed closely a group that ill repaid such study, that the general impression of sallowness, dishonesty, and ferocity subsided into more distinct ideas, and enabled a spectator to note that at least half the men were mere tools, and that Haureau, and a couple of evil looking persons who sat close to him, were the masters of that company.

They were drinking and smoking when Adair came in, and there was the combined gabble which characterises such meetings among foreigners, and which contrasts with the silence maintained by Englishmen of the same kind, while some one dull guest is permitted to drone and prose over something which the party accepts as a narrative. But it was curious to notice that at the approach of a stranger, who could ill be made out in the smoke and gloom, not only did those who could see him instantly suspend talking, but the signal of silence was caught by those whose backs were towards the new-comer. It was like the hindmost pointer's drop into attitude at sight of the point of his colleague in the field.

Haureau rose, and came round to Ernest Adair.

"So, my friend, you have lost no time in coming to be congratulated?"

"Congratulated on what, in the devil's name?" was the ungracious response.

"Why, you have had your letter."

"I have had none."

"Nothing from that lawyer?"

"Nothing."

"And no message?"

"None."

"Then you have no business here. That you know well, Adair."

"Business or none, I *am* here, and, being here, I mean to stop. I will not kill myself by inches."

"Nobody asked you to kill yourself at all," said Haureau, looking at him with a sinister expression. "But you were ordered to remain on guard until relieved."

"And I have deserted my post," replied Adair, savagely. "What is this letter you talk of?"

"You have heard nothing?"

"Nothing, once more. Do you want me to swear it?"

"Well, no, I cannot say that I do; great weight as your oath would, of course, have. But, come here."

He seized the arm of Ernest and led him, not to a seat, but between two of the party, and all the upturned eyes of that group were at once upon Adair.

"Our friend informs me that he has received no orders or instructions of any kind, and yet he is here. He is a brave man, is he not?"

A strange, growling assent passed round.

"A brave man," repeated Haureau. "A chair for the brave man. We will drink his health, English fashion."

Ernest Adair took a seat, and lit a cigar, but did not speak.

"He is impatient for some news, which I will tell him by-and-bye," said Haureau, with a coarse laugh. "Meantime, fill, all of you, and drink to him."

The men obeyed, some with a slight and sullen nod, others with a more elaborate and mocking gesture.

Ernest's answer was a mocking curse, addressed to the group generally. At this Haureau laughed boisterously, and pushed a glass towards Adair.

But, three hours later, when the room had long been abandoned by all save Haureau's party, Ernest Adair was in another mood. He had drunk deeply, he had poured out a flood of wild and ribald talk, such as no pen sets down even for men like himself, he had sang songs, and he had in turn encountered each of his companions in a combat of abuse, in which he had utterly vanquished and silenced all except Haureau, against whose imperturbable but ruffianly jollity Adair's sarcasms were spent in vain, while his denunciations were met by nods of approbation, given with a meaning which Ernest was not too intoxicated to observe as intended, which he pointed out scoffingly to the others, and defied Haureau to explain.

Soon afterwards, Ernest, who had been steadily gazing at Haureau, and in an under voice delivering himself of new taunts, looked round, and saw that the party had diminished by one-half.

"So," he exclaimed, "I have whipped them to their kennels, have I?"

"Nay, nay," said Haureau, "they are good men, and have gone home to their wives."

Ernest Adair looked at him for a moment, and then sang—

"Woman keeps us waiting now,
But she shall wait for us to-morrow."

"*Shall she?*" said Haureau, smiling.

"Yes, she shall," responded Adair, with drunken fierceness.

"You must go home, Ernest Adair," said Haureau.

"How dare you dictate to me what I shall do, galley-slave?"

There was an angry murmur at the word, and Ernest Adair, more incensed, repeated it, and looking savagely round, declared all present, except himself, to be convicts escaped from the galleys.

"Brave talk," said Haureau, repressing his companions, who rose in wrath, and whom he compelled to seat themselves. "Brave talk. But, my friend, you dare no more stay away to-night from your lodgings than you dare throw yourself into the river that keeps lapping and plashing there."

"I dare not? I will not return to my lodgings, galley-slave, and if I do not throw myself into the river, it is because I am dressed like a gentleman, and do not choose to spoil my clothes, for fear I should look like you and your gaol-birds here."

"You dare not remain out. Else I would row you over to *my* lodgings, and we would make a night of it. But go home, and obey orders."

"Row me to your lodgings. Do you live on the river Styx, or the river Acheron?"

"No matter—you dare not come."

"Dare not, and with rowers like you and your friends, who learned to row in the galleys—classical ruffians as you are. Styx or Acheron, I ask you."

They all went out soon afterwards, Haureau walking beside Ernest Adair, who had now worked himself into the phase of intoxication in which one is perfectly, subtly, conscious of all that goes on or is said around, but supposes oneself to be reserving all comment for another occasion. He walked uprightly, repulsing the arm of Haureau, and the party, turning down a narrow lane proceeded along a small wharf, and stopped at a tall gate, partially latticed.

"Are these your lodgings, Haureau?" said Adair. "That is very like a prison window—you must feel quite at home."

He spoke distinctly, yet without the intonation that used to give point to his speeches of other days.

"No, this is my carriage house," said Haureau, opening the door.

Looking in, Adair perceived water. The place was an old boat-house, but there was no boat there. The tide was high, and the gloomy space within resembled a tank, only that under the eaves there came a gleam from a distant lamp.

Adair was sobered into self-possession in a moment. The next, his hand was upon his breast. But Haureau's iron clutch was upon the wrist of Ernest, who at the same instant felt his other arm seized by two of his companions.

Even at that instant, and with the conviction that came upon him, the courage of Ernest Adair did not forsake him.

"Listen, Haureau!" he said.

"We have listened to you enough to-night, my friend. It is your turn to be silent for a long time."

"I understand."

"All that was wanted has been learned without your help, and you are dismissed."

"Bertha!" cried Ernest, with a bitter cry.

It was a dastard blow, but which of the ruffians around him struck it will never be known till the judgment. Then the senseless body was thrust through the door, and into the dark water.

It must have lingered in that shed, and have been fetched away by another tide. For it was on the following night, and very late into that night that some men who were on their way to a barge upon the river came upon the body as it lay at the foot of a little causeway. Scarcely paler than in life, and with the peace of death on the brow beneath which throbbed no longer that once busy brain—parted in death the lips whose words had been sin, and whose kiss had been shame—so lay Ernest Adair. The secret of his death has been well kept, and he lies in a nameless grave.

CHAPTER THE LAST.

We were to have had but one chapter more, and indeed there is little else to tell, and yet one would not willingly bring down our curtain upon a mournful *tableau*. Of some thirty persons who have more or less actively aided in our story, two have died by violence, and the hand of death was upon the third, when her connection with the narrative ceased. She is gone, and Mr. Berry has disposed of his Lipthwaite property to Sir Frederic Charrington, and upon the site of Cromwell Lodge a school for girls now flourishes, under the patronage, and what is better, under the vigilance of Lady Charrington. It is a school where the girls are taught more cookery than catechism.

In strictness, Bertha Urquhart ought to have made a sorrowful end, upon which (to preserve the theatrical image) the rose-coloured light of a sentimental repentance should have been thrown. But, weak in all else, she was too weak to offer an example of poetical justice. The property left by Robert Urquhart was realised, and it afforded her a comfortable income, upon which she lived for some months at Cheltenham, where she married a gentleman who had been an officer in her Majesty's service. He had been an exceedingly fast man, but having spent all his money, and a good deal more, had to sell out, and look out. He looked out well, and wooed as fast as he had lived. He is kind to Bertha, and she understands him—the severest thing one can say of him, for he is a very goodnatured Gorilla. Bertha has taken to distributing tracts, and in a season or two, unless she runs away again, will possibly have a private evening service for herself and select friends, at the St. James's Hall.

Alphonse Silvain has, of course, married Mary Henderson, and will exhibit perfumery at the International Exhibition next year. Meantime his wife exhibits, with intense pride, an international baby, which has been christened Laura.

Archibald Vernon continues to live at Canonbury, and to retain the conviction that he is an ill-used man, whom the world has never comprehended. It is reported that he, also, has thought of coming before that world, next year, and has gone to the extent of promising to write to Charles Hawkesley, to get him to ascertain whether any kind of lecture-room is likely to be vacant in the middle of the approaching summer.

Charles Hawkesley's new play has been a tremendous success for Mr. Aventayle, and, strangely enough, for the author himself. For the admirable but eccentric manager got hold of an idea that an author and a manager might be regarded as partners in the production of a piece, just as author and bookseller stand in the production of a volume. And "after expenses," and other deductions of a most just and righteous character, Aventayle actually shared with Hawkesley the profits of *Reckoning without the Host.* The proceeding is most ridiculous, but Aventayle says that he is satisfied, and that the author is devoting himself to the composition of another play, of the very best character, and to which he can afford to give ample time and elaborate workmanship. This is an age of experiments and new-fangled notions, but this headlong advance towards the recognition of the value of brain-work is surely to be deprecated. A present of a fifty-pound note, on a three hundredth night, with speeches and reporters, would have been an act of generosity as well as a capital advertisement, and quite enough. But Aventayle is an odd man, and if he were not growing so rich, one might speak of his eccentricities with more severity.

So ends our story of man's wickedness and woman's weakness, of false love that brought ruin, of true love that lived through the storm. If there be a moral in the tale—and in what story of trial, suffering, and sorrow is there not a moral?—assuredly it shall not be preached here. It shall be left to the apprehension of those of whom the author, after ten months of unbroken intercourse, takes for the present his Farewell.

THE END.

HALF HOURS AT THE KENSINGTON MUSEUM.

THE MUSEUM OF PATENT MACHINES, &c.

OUR Museums are getting so extensive that it is becoming a most wearisome task to attempt to master their contents in the limited time sight-seers are generally able to devote to a stroll through them. All the world knows it is one of the most headachey things in the world to spend a couple of hours among the miles of galleries in the British Museum; and the South Kensington Museum is becoming almost as confusing a place of amusement. We may have half-hours with the different departments, however, without coming away with that sense of mental prostration which invariably attends any attempt to "do" the museum in one afternoon. There is one room in it, but not of it, which always throws open its doors free of charge—the Museum of the Commissioners of Patents, in which a whole Noah's Ark of machines and models meets the eye of the visitor. This exhibition is totally distinct from the South Kensington Museum, and only occupies a room temporarily until a building is erected by the Commissioners with the 90,000*l.* and upwards they have in hand for that purpose.

In taking our survey of the riches of invention which meet the eye on every hand, let us first glance at its curiosities. In a glass case at the top of the room are several worm-eaten wooden pieces of machinery, which do not look unlike portions of Dutch clockwork, on a large scale. On the foundation of these crumbling fragments the great staple of English manufacture has been built—these are the original spinning and carding machines of the barber Arkwright. When he used to leave his basin and his lather to plot and plan wheels and cogs, his wife used to scold him for not attending to his business,—if that old dame could have seen in a dream the mighty results these ugly-looking engines were destined to give rise to in the course of a century—could see the millions of slaves enthralled to grow cotton for its delicate fingers to spin—could see the fleets of ships they called into existence to supply it with food—could see the great port of Liverpool they had created, the great city of palaces, Manchester, which they had built, the enormous fortunes which they had earned, and the comfort they had conferred on millions,—she would have dreamed a dream, which surpasses anything related in the Arabian Nights, and with the addition that the dream was destined to come true. Let us make our bow, therefore, to those worm-eaten old engines, and be grateful that their inventor had a mind superior to taking his customers by the nose. By way of contrast to the rude models of Arkwright we see close at hand a spinning machine of the present day. The clumsy beams have given place to light iron work, finished with the delicacy of a clock movement; Arkwright himself would scarcely recognise the transmutations his own germ has passed through in the course of a century. Not far off we see another of those great mother thoughts which have moved the world during the present century—there is the original model of the first locomotive that ever ran. Mr. Trevethic, in 1802, conceived the plan of substituting steam for horse-power on the Cornish tramways; and here is the original idea of a power which has since revolutionised society. The original locomotive had but two large wheels and a small guiding wheel, like a perambulator, and was called by the country people the Puffing Billy!

The machinery was confined to a cylinder, a piston-rod with a cross-tree head, which communicated the motion by two shafts to cranks on the wheels; this was the original germ which developed into the existing complicated locomotive, a model of which is placed opposite to it. Trevethic's engine worked at the moderate pace of three and a half miles an hour, and carried coals only. George Stephenson improved upon this, and produced his engine, which carried passengers for the first time in 1829 on the Stockton and Darlington line, and continued working until the year 1850. This locomotive would have been an interesting addition to the machines in this room, but it is, perhaps, better where it is, mounted on a pedestal at the entrance to the Darlington station, where it takes its stand as the premier locomotive of the world. As it cannot be removed, an excellent photograph does duty for it, and clearly shows that its machinery was only an amplification of Trevethic's idea, the piston-rods, cross-pieces, &c., working perpendicularly over the boiler. But a

still greater rarity is the beam engine model made by Watt himself. This model works the steam valve, by what is termed the tippit motion. An additional interest attaches to it over and above the fact that it is one of the first ideas of the great motive power of the present day, inasmuch as Watt always kept it under his own observation in his drawing-room. It is but rudely finished, but the very fact that its great inventor's eye dwelt upon it with pride and triumph invests it with a poetry all its own. Another beam engine, once belonging to Watt, with parallel motion attached to the piston-rod, is a better example of mechanical skill. We have not far to look for the first germ of steam navigation. That huge model which appears to be a combination of two funnels and a number of chains working over wheels is the parent marine engine. As early as the year 1787, Patrick Miller, of Dalswinton, Scotland, engaged himself in making experiments with double and treble boats, which he propelled by means of wheels placed between them worked by manual labour; in the following year he induced one Symington, an engineer, at Wenlock Head, to apply to it a marine steam engine he had invented. This engine propelled the boat along Dalswinton Lake at the rate of five miles an hour. This was undoubtedly the first attempt ever made to use steam as the motive power in a vessel; although it was not the first practical steam-boat. The engine which belongs to the earliest history of that invention, is what is called an atmospheric engine, that is, the piston is raised by the action of steam, and then it is forced down by atmospheric pressure. The history of this curious parent of steam navigation is worth noting. After the trial in the boat, the engine was removed to Mr. Miller's library, where it remained until his death in 1815; in 1828, it was sent by his son, packed in a deal case, to Messrs. Coutts & Co., in the Strand, where it remained until 1837, and finally it found its way to a plumber's in Edinburgh, who flung it aside with the purpose of melting it. However, the model was rescued from destruction, and in 1855 was restored to its former working condition by Messrs. Penn & Son in 1857.

It is usually supposed that the boat made by Fulton, in America, was the first practical steamboat; but that honour must be transferred to Symington, who, in 1801, perceiving that his old engine was too complicated to work practically, completed a new one with the later improvements by Watt and others, and placed it on board the Charlotte Dundas, which was, in truth, the first practical steamboat. The paddle was still a problem which puzzled mechanicians. Its best form, so as to offer the least resistance on entering and leaving the water, engaged the skill of hundreds of thoughtful men, many of whose models are to be seen in the museum. But other minds were intent upon superseding the wheel altogether, and, at last, Captain Smith's screw did so. We can all remember the fierce disputes there were among nautical men with respect to the relative powers of paddle versus screw—a dispute which was finally settled by the tournament which took place between her Majesty's steamer Rattler, screw steamer, and the Electro, paddle-boat, both of equal size and power. They towed stern to stern, and the propeller dragged the paddle after her at the rate of two and a-half miles an hour. This victory seems to have put an end to all attempts to improve the paddle, and now human ingenuity seems concentrated upon the screw. The number of patents taken out for different forms of the propeller is something extraordinary, and the models in the museum are in themselves a curiosity. Every degree of pitch that can be got out of a spiral, would seem to be exhausted, and the favourite design of screw now appears to be modelled in the shape of a blade-bone. The screw of the Rattler, for instance, ten feet in diameter, looks like the remains of the scapulæ of some gigantic Ichthyosaurus. Thus we go on improving upon each other's efforts, every one adding some trifling improvement until perfection is attained.

Five minutes' walk through this museum is sufficient to satisfy me of the profundity of the remark that "it is society that invents." Let us take the subject of steam as a motive power, and let us see how long the idea has been before the world. Here, on the walls, we find a coloured drawing of Hero's steam-engine invented 130 years before Christ! We can scarcely conceive that whilst Pan was still young, and whilst great was Diana of the Ephesians, the thin white vapour which now moves the world was even then dandled as a second infant Hercules. Hero's idea of the application of the elastic force of the youthful giant was confined to simply projecting it against the resisting medium of the air—a hollow spindle connecting with two arms turned in opposite directions being filled with steam, the two jets acting on the air, gave the simple machine a revolving action. What centuries of thought lie between this and the great engine of the Leviathan steamer, a model of which is to be found in this room.

In these centuries we find the names of Solomon De Caus, Giovanni Branca, Torricelli, the Marquis of Worcester, Denis Papin, Thomas Savery, Thomas Newcomen, and Watt, to say nothing of the host of inventors who have added improvements in the present century. All of these studious men have nursed the mighty infant through the ages, until its limbs present their present gigantic proportions; and yet we say, familiarly enough, that steam is still in its infancy, and, without doubt, the New Zealander, could he exhume the museums of science of his day, will be able to read a list of improvers of steam as numerous as those we have already had.

Another great element of our present civilisation is beginning to make signs of its existence in this museum. We allude to the electric telegraph. Bakewell's Copying Machine is one of the most interesting of this class, as it brings before the public eye the means that can be employed to write with a pen thousands of miles in length. If the Atlantic cable were in working order, for instance, a man through its instrumentality could sit down to write a letter in London, and feel certain that a fac-simile of his handwriting was at the same moment coming out of the telegraph office at New York. The manner in which

this astounding machine works is as follows. The message is originally written on a conducting material, such as tin foil, with resin or some non-conducting ink. Over the face of this letter, which is placed on a cylinder, a point of metal revolves—this point is in connection with the conducting wire; at New York say, a piece of chemically prepared paper is placed on a like cylinder to receive the message; both cylinders are made to move round by clockwork. As the point at this end of the wire passes over the non-conducting resin writing no current passes, hence the point which moves synonymously with it at New York does not change the colour of the paper, but all the other surface of the writing tablet being a conductor, the currents pass and deepen its colour by chemical action on the far-distant recording tablet. The receiver thus obtains a perfect fac-simile of his correspondent's handwriting done in white upon a blue ground. Specimens of this electrical handwriting are placed beside the telegraphic machine, and afford an admirable example of the caligraphy of the lightning pen.

The great practical puzzle of the present day—submarine telegraphy—endeavours to find its solution in dozens of different specimens of electric cables. When it is remembered that the problem to be solved is to produce some envelope which shall perfectly isolate and protect a conducting wire, running for thousands of miles, as the Atlantic cable for instance does; when it is further remembered that a fault in the covering material of the wire only as big as a pin-hole speedily becomes enlarged to the size of a sixpence by the burning action of the electric fluid passing out into the water; when, again, we find the gutta-percha, with which cables are covered, is liable to the attacks of insects, to be abraded by rubbing on sharp rocks; and when we find that in shallow water cables are always liable to be dragged up by ships' anchors, the difficulties of making them electrically secure are indeed immense. Hence hundreds of patents have been taken out to accomplish the desired end, and thousands of miles of ruined cable, representing some two millions of money, now lie at the bottom of the ocean, subjects of great curiosity no doubt to the fishes.

We have been noticing hitherto different forms of the great inventions which have changed the face of society within the last quarter of a century; but the museum does not shut its doors to ingenuity employed in even the smallest objects. Here, for instance, is a collection of ancient and modern locks,—some of Chinese, some Indian, and some Egyptian origin, all giving testimony to man's familiarity with this little instrument before the Christian era. In these, all the leading features of the tumblers in our best locks are to be found. The Indian padlock may be said to depend upon its security for its moral influence! It is made in the form of a bird, representing the Hindu deity Garuda. The works are of the most trumpery kind; but it is supposed to owe its security to a fear of the vengeance of the deity whose image it represents. As a pendant to this moral lock, are the keys poetical, which once gave freedom to Mary Queen of Scots from Lochleven Castle.

Sewing machines of all kinds are here, of course; but we were struck with an invention calculated, we think, to give relief to the needle-woman in a still more marked manner. A machine to mend stockings has always struck us as a great desideratum: our inventor, however, professes to accomplish his object in a more expeditious manner. Noting that stockings wear out only in two places, at the toes and heel, he manufactures these pieces at a cheap rate, in order that they may be pieced on at home.

Another ingenious man has patented a sweeping brush, which runs along the carpet on rollers, and collects all the dust in a covered box. The advantages of this machine are, that it does its work without scattering the dust on the furniture; therefore the housemaid need not cover it up while pursuing her cleansing work.

Another individual, who still further labours to ease the domestic servant, exhibits a patent for peeling potatoes and apples, and for mincing meat; and the gas engineers show working models of different gas stoves, which supersede the use of coal fires altogether.

The introduction of new materials, and the cheapening of old ones, has given rise to their applications in articles with which their use would, on *à priori* grounds, appear totally inadmissible. Here, for instance, is a glass pump, working with an india-rubber valve; and it seems strong enough to resist any ordinary rough usage. Close at hand is a mangle, the bed and rollers of which are made of the same fragile material.

The introduction of india-rubber has, we know, revolutionised whole trades, and the glass-cases in the museum are filled with specimens of the purposes to which, under different forms, it is applied.

Sedulously masticating a piece of india-rubber, in order to make bladder-pops in our school-days, how little did we dream that the sticky mass was destined to play the part in the world it has done during the last quarter of a century. The many waterproofing purposes to which Messrs. Mackintosh have applied it, we are all familiar with, and the change which takes place in its nature on the application of a little sulphur, we also know; but the public, unless they visited the museum, would scarcely dream of the extent to which its consequent increased resiliancy has caused it to displace the use of steel in the form of springs, and of packing of all kinds, in order to make air-tight joints.

Yet another change is induced in this Protean material: by simply baking it, we get what is termed ebonite by the Messrs. Silver, its discoverers and patentees. This substance has all the appearance of jet, with this advantage, that it is tough instead of brittle; hence its applicability to a thousand uses in the arts and sciences. We see here chains which cannot be told from the best jet, combs, paper knives, statuettes, anything, in short, which can be moulded, and requires a high finish and polish. These specimens of the manufactures carried on at "Silver Town," in the Isle of Dogs, are full of the deepest interest, and prove how quickly many of our oldest established trades may be prostrated by the discovery of some new material, or the chemical change which may

be induced by scheming men in an old one. Not the least attractive feature in this museum is the collection of portraits of great inventors. The marked individuality in every countenance is very observable. But these are the lineaments of the famous and fortunate discoverers. The philosopher must in his own mind draw a picture of the amount of care and struggle represented by the great mass of patents in this room. Of the many years spent in efforts which have only terminated in the total impoverishment of the thoughtful toilers, of the many hopes blasted, of the castles in the air that have been transformed to dismal prisons, we do not see here the expression on the canvas, but be sure they have existed, and will exist as long as there remains in man an irresistible impulse in the path of progress, and a God-like energy to pursue it at all cost and sacrifice.

A. W.

GREEN SEAWEEDS.

Most people who have visited the sea-side know some little about seaweeds. They are familiar with the characteristics of the three great orders into which this class of plants has been divided, have learned to distinguish some of the commoner and more elegant species, and have perhaps made a small collection of specimens more or less skilfully dried upon paper. They know, too, something of the purposes to which some of the seaweeds are applied, have probably tasted laver and Irish moss, and have heard that the Scotch eat dulse, and that the ashes of the fuci are made into kelp. And with this amount of knowledge very many rest content. Yet there are few objects which offer more points of interest than the seaweeds to any one who is willing to look a little way below the surface, and to spend a few hours in learning something of their modes of growth and propagation.

The name seaweed can in its strict sense be applied only to plants growing in the sea. If, however, we use it as a translation of the botanical term algæ, it becomes applicable not only to these, but to a considerable number also which are never found in salt water. Every river and brook, every pond, ditch, and roadside puddle has its algæ—even on damp earth and walls they are seldom wanting. On the other hand, at least one plant growing in the sea, the Zostera marina, sometimes called seagrass, is a true flowering plant, and cannot therefore properly be called a seaweed. It has been found convenient to divide the algæ into three great divisions: the confervoideæ, otherwise called chlorospores, or green-spored algæ; the florideæ rhodospores, or red-spored algæ; and the fucoideæ melanospores, or dark-spored algæ. Colour, which is generally a mark of very small value in classification, is here a tolerably safe guide, so that we shall not go far wrong in calling all the brown seaweeds melanospores, all the red seaweeds rhodospores, and all the green seaweeds chlorospores. It would be impossible in the space of a single article to give even the slightest sketch of the history of these three orders, and we shall therefore for the present confine our attention to the last only, the chlorosperms or green-spored algæ, and to those only of this order which are found in salt water.

The green seaweeds which we find growing on our seaside rocks belong most commonly to one of the four genera: conferva, cladophora, enteromorpha, and ulva. The broad bright-green fronds of the Ulva lactuca, the lettuce ulva, or laver, are too well known to need any description, but there are some curious episodes in its history which are far less generally known.

Among the strange facts which modern improvements in the microscope have brought to light, there are few more unexpected and more startling to our preconceived ideas than the possession by certain plants of a faculty of motion so like in every respect to that of some of the lower animals, that the first observers had no suspicion of their vegetable nature. You may perhaps feel inclined to doubt the possibility of the existence of these moving plants; you may think that the story is a mere scientific figment contrived for the purpose of puzzling the unlearned, and you ask why we cannot be contented with the good old definition of our younger days, "Plants live and grow; animals live, grow, and move." If you happen to be by the sea-side, you may soon satisfy your doubts, and in no way more easily than by bestowing a little attention upon the common green laver. Go down to the beach at almost any state of the tide, and in the first rock pool you see you will probably find some of the conspicuous bright green fronds of this seaweed. Probably, too, if you look closely you will see that some of the fronds seem to have lost their brilliant hue and are limp, transparent, and colourless, not unlike wet tissue paper. They are faded, you say, and dying. By no means. Never were they more full of life than they are now. Gather one of these colourless fronds, or rather one which is half green, half colourless, and take it home with you for examination. Cut off carefully a small piece from that part of the frond through which the line passes, dividing the green from the uncoloured half, and having placed it in a little sea water on the stage of the microscope, examine it with an object-glass of a quarter of an inch focus. You will, in the first place, see that the frond of laver is composed of a network of small, many-sided, irregularly-shaped cells densely packed together with their sides in contact, and by slightly altering the focus you will find that another and precisely similar layer constitutes the under surface of the frond. Next, if you turn your eye from the seaweed to the water in which it is floating you will see, nimbly swimming about, a considerable number of small green bodies in shape something like a pear. These, if you now see them for the first time, you will, beyond all doubt, pronounce to be animals, probably belonging to the class of the infusorial animalcules. But you will be very far from the truth in your guess, for these pear-shaped bodies are the *zoospores*, or moving spores of the green laver, and have probably just emerged from one of the cells of the fragment at which you are looking. Now look again at the seaweed, and observe particularly the cells of which the coloured portion is made up. These you will find to be filled with a

green colouring matter, while those cells which form the colourless half of the leaf are quite empty. If your microscope is a good one, and you know how to manage it, you will be able to detect in the centre of each of the empty cells a very small hole or pore through which, probably, the vanished colouring matter has escaped. Scattered among the empty cells may be seen a few which are not yet quite empty, and within these one or two more zoospores may plainly be seen moving. At first you think you are mistaken; you wipe imaginary dust from your eye-piece, alter the arrangement of your light, and look again, but only to be fully convinced that the moving bodies actually are within the cell. Returning now to the green half of the frond, you will see that in the cells situated near the boundary line the internal colouring matter is beginning to form itself into small clusters, and in one or two of these cells you will observe a strange motion which has been termed "swarming," from the resemblance which it has been supposed to bear to the motion of a swarm of bees thickly clustered together. Other cells, again, you may see in which the zoospores are perfectly formed, and seem to be trying to find a means of escape, and perhaps in one of them you may be fortunate enough to detect a zoospore in the act of escaping through the pore. May we not conclude from these facts that the pear-shaped bodies which we saw swimming about in the water are identical with those which we detected moving within the cells of the plant, and that they are, in fact, the zoospores, or moving spores, of the ulva formed from the green colouring matter with which its cells are originally filled?

Doubtless if you are inclined to be sceptical it will be possible for you to construct a theory by which most of the facts may be explained without allowing to plants the power of spontaneous motion. Suppose, it may be said, these moving pear-shaped bodies are really, as they seem to be, animals; suppose that they feed upon the green contents of the cells of the laver, and that the white portion of the frond consists of cells whose contents they have devoured. There will then be nothing strange in their occurrence within the cells into which they may easily be supposed to have penetrated in search of food, having first pierced the small hole which you have seen in the cell wall. Now is there anything absurd in such a supposition? I do not know that there is, though I much doubt whether it would meet with ready acceptation from any one who has actually witnessed the process which I have attempted to describe, nor do I think the peculiar appearance known as swarming could be thus accounted for, or the occurrence of the moving bodies in great numbers near the line which divides the green from the white half of the leaf, and their total absence from any other part of the former half.

But if we carry our observations a little further we shall find ample reason for rejecting as inadmissible any theory involving a belief in the animal nature of the zoospores. If these moving spores are really, as we have supposed, the produce of the ulva, we may expect that they will at some period of their existence grow into the likeness of their parent. If then we can keep them alive for a short time, and watch what eventually becomes of them, we shall probably find the means of settling the question. Now there is little difficulty in effecting this. Take a small glass cell containing a few drops of sea-water and some of the zoospores, and, in order to prevent the water from evaporating, place the cell upon a layer of moist sand and cover it with a bell-glass or a tumbler, and you will be able to preserve the zoospores alive for any length of time, and to trace from time to time any changes which take place in them. In a few days it will be found that they have ceased to move, and have attached themselves by their smaller end to the glass in which they are contained, generally to that part which is most freely exposed to the light. Then they will begin to grow in the manner which we shall presently describe,—a long filament being first produced which is gradually converted into a broad frond. When this process has once commenced it will soon reach a point at which even the most sceptical will be compelled to allow that the organism before him is undeniably a plant. These observations must, of course, be made under the microscope, for though the final result of the process is a plant of no small size, attaining sometimes a length of two feet and upwards, yet the zoospores themselves are so small as to be absolutely invisible to the naked eye.

There is good reason to believe that these zoospores do not truly represent the spores of the ulva, but are rather analogous to the bulbils by which some flowering plants are reproduced, and that true spores, probably motionless, exist in these as in almost all plants with which we are acquainted. These supposed spores, however, have not yet been detected by any observer.

Probably you will feel some curiosity as to the agency by which the strange animal-like movements of the zoospores are produced. Each zoospore is furnished with four, or in some cases with two, cilia or vibrating threads attached to its smaller end, and by the motion of these it is urged through the water. The cilia can only be seen, satisfactorily, when object-glasses of a high magnifying power are employed, and then only when they have been coloured and rendered opaque by the addition of a small quantity of tincture of iodine to the water, or when the zoospores have been dried at a gentle heat upon the glass slide. Of the force by which the cilia are set in motion nothing at present is known.

Very similar to the ulvæ in their habits and modes of growth, and not unlike in appearance to young filaments of the same seaweed, are the enteromorphæ or sea grasses, some species of which are common on most of our coasts. Closer examination, however, shows us that the frond of enteromorpha is not flat but tubular, the walls of the tube being composed of small cells like those which we have already seen in the frond of the ulvæ. The formation and motion of the zoospores may be watched in the enteromorphæ as well as in the ulvæ; but as there is no essential difference between the two cases, we need not again describe the process here. The commonest species of the sea grasses, the Enteromorpha intestinalis, which

is found both in the sea and in freshwater ditches, attains a length of more than two feet, and a diameter of two-thirds of an inch.

The cladophoræ and confervæ form tufts of light green threads, attached to stones and rocks between tide marks, and may be distinguished from each other by the threads of the latter being simple, while those of the former are much branched.

The cladophoræ are small plants, seldom exceeding a few inches in length, but the confervæ grow to a considerable size, specimens being sometimes found of one species many feet in length. These seaweeds are of very simple construction, each thread consisting of a series of cylindrical cells arranged end to end, the length and thickness of the cylinders varying much in the different species. Like the ulvæ, the cladophoræ and confervæ are reproduced by means of zoospores, and the resemblance of these moving spores to animals is in this case rendered yet more close by the presence of a minute red spot exactly like that which is found in many of the infusorial animalcules, and which, in their case, is supposed to represent an eye. The appearance of these plants under the microscope is very singular, the green colouring matter being frequently arranged in a net-like pattern upon the wall of the cell. Sometimes, too, the threads forming the net seem to be strung with small bright beads, which, by the use of proper chemical tests, may be shown to be granules of starch.

But there is yet another reason why these simple seaweeds are peculiarly interesting to the microscopist. Owing to their great transparency and the power which small fragments possess of continuing to grow when detached from the plant, if they are kept in water and exposed to the light, the whole process of their growth may be observed without any difficulty. To enable the reader to comprehend the nature of this process, it is necessary to say a few words about the vegetable cell. A full account would require not a few lines but a volume, and volumes have been written upon the subject, but enough for the present purpose may soon be told.

Every plant, the largest tree as well as the smallest alga, is built up entirely of cells, varying much in size, shape, and colour, but all constructed upon the same plan. The most simple form of these cells consists of a closed membranous bag, containing a fluid sap. The bag is formed of two layers, the outer thick and conspicuous, the inner very delicate, and not easily seen. This inner layer, which has been called by vegetable physiologists the primordial utricle, is supposed to be in a peculiar degree the seat of the life of the cell. The seaweeds which we are now considering consist, as we have said, of a single series of such cylindrical cells placed end to end, and the several threads of which the plant is composed increase in length by the division of one of these cells into two smaller cylinders, each of which then grows to the dimensions of the original cell from which they were derived.

If we place upon the stage of the microscope a growing fragment of cladophora we shall easily be able to observe the mode in which this division takes place. It is to the terminal cell of one of the branches that we must direct our attention, since it is for the most part in these only that division is going on. If we observe a cell in which division is just commencing, we shall see that the delicate membrane which lines the wall of the cell is gradually contracting at a point near the middle of the cell, so as to divide the green contents into two nearly equal halves. The contraction slowly increases until that part of the cell in which the change is going on has assumed nearly the form of an hour-glass. We may imitate the change of form closely by taking a small tube of gutta percha, or any other elastic substance, passing a string round it, and gradually drawing the ends tight. At length the two halves of the hour-glass become entirely separated, the outer wall of the cell having in the meantime undergone no sort of change. Next a new cell wall is secreted around each of the two halves so formed, so that two new cells are produced, both included within the outer wall of the original cell. The two halves then increase in length, until each has attained its full size, and a fresh division commences in the new cell, which now forms the termination of the branch. In the simple unbranched confervæ there is no other mode of division than this, but in the branched cladophoræ we find another slightly modified plan of growth. When a new branch is about to be formed, the lining membrane of one of the cells (in this case not a terminal cell), begins to project sideways, pushing the outer cell wall before it, so as to form a protuberance on the side wall of the cell. After this outgrowth has reached a certain size, a process of division takes place, exactly similar to that which we have already described, by means of which the newly-formed cell is separated from the old branch, and becomes the first cell of a new one. Cells in every stage of division may often be seen in a small fragment of cladophora, some showing the projection just commencing, others the hour-glass-like contraction of the contents of the cell, and others again the completion of the division, and the formation of the new cell wall.

Very different in structure from any of these plants is the pretty little Bryopsis plumosa, whose dark green feathered silken tufts, from one to four inches high, may often be met with between tide-marks, growing upon rocks, stones, or other seaweeds. This plant belongs to the order of green seaweeds, called siphonaceæ, or tube-like seaweeds, the stem and the principal branches being composed of a single large branched tubular cell. Zoospores are produced in this plant in all the smaller branches with which the principal branches are feathered, but the phenomena resemble too nearly those presented by the ulvæ and confervæ to need a separate description.

We have now nearly completed our sketch of the green sea-weeds. Some we have passed over as presenting few points of interest; but we must not omit to mention one very curious tribe of plants, more common perhaps in fresh waters, but of which some species inhabit the sea,—the oscillatoriæ, or oscillating algæ. These plants are not attached to rocks, but float freely in the water, forming a dense layer of very fine green threads. There is nothing striking or attractive

in their appearance, and few people probably ever notice them, or could be easily induced to believe that there is anything in them worthy of notice. But place a small portion under the microscope, and you will not long be in doubt as to where the interest of the oscillatoriæ lies. You will see an evident and undeniable plant actively moving. In the case of the moving zoospores, which we just now described, it is only by seeing them within the cells of the parent plant, or by patiently watching their growth, that you can convince yourself of their vegetable nature; but that the oscillatoriæ are plants, notwithstanding their strange motions, your eyes will at once convince you. And strange indeed their movements are. Here you will see a thread moving from side to side like the pendulum of a clock, one end vibrating, while the other remains fixed; here a second twists itself about like a worm or a caterpillar, while a third combines this with an onward progressive motion. "If a piece of the stratum of an oscillatoria," says Dr. Harvey, "be placed in a vessel of water, and allowed to remain there for some hours, its edge will first become fringed with filaments, radiating from a central point, with their tips outwards. These filaments, by their constant oscillatory motion, are continually loosened from their hold on the stratum cast into the water, and at the same time propelled forwards; and as the oscillation continues after the filament has left its nest, the little swimmer moves along, till it not only reaches the edge of the vessel, but often, as if in the attempt to escape confinement, continues its voyage up the sides till it is stopped by dryness. Thus, in a very short time, a small piece of oscillatoria will spread itself over a large vessel of water." The cause of these singular movements is a mystery to which at present we have no clue. No cilia can be detected, nor any other organs of motion; and when we have said that the movements of these plants are rendered more active by heat and light, and checked by any strong chemical agent, we have exhausted the whole stock of our present knowledge.

Strange as are some of these facts when told, they seem far more strange when seen. The history of the seaweeds is one which words can but very imperfectly relate. Probably no one fully realises the idea of moving plants, until he has seen for himself the swarming of the zoospores within their parent cells, or the oscillatoriæ performing their singular rhythmical movements. Here, too, as in all other branches of natural history, he who wishes truly to know, must not rest contented with the descriptions of others, but must take the earliest opportunity of verifying or correcting them by his own observation. C. C.

ADALIETA.

(FROM BOCCACCIO.)

PART I.

LONG years agone—so saith the chronicler
Whose old Italian gentleness of touch
Findeth no echo on the northern harp
To counterpart its music—long ago,
When Saladin was Soldan of the East,
The Kings let cry a general crusade,
And to the trysting-plains of Lombardy
The idle lances of the North and West
Rode all that year, as all the year runs down
Into a lake from all its hanging hills
The clash and glitter of a hundred streams.
Whereof the rumour reached to Saladin,
And that swart King—as royal of his heart
As any crownèd champion of the Cross—
That he might fully, of his knowledge, know
The purpose of the lords of Christendom,
And when their war and what their armament,
Took thought to cross the seas to Lombardy.
Wherefore, with wise and trustful servants twain,
All habited in garbs that merchants use,
With trader's band and gipsire on the breast
That best loved mail and dagger, Saladin
Set out upon his journey perilous.
In that far day fair land was Lombardy!
A sea of country plenty, islanded
With cities rich, nor richer one than thee,
Marble Milano! from whose gate at dawn,
With ear that little recked the matin-bell
But a keen eye to measure wall and foss,
The Soldan rode, and all day long he rode
For Pavia—passing basilic, and shrine,
And gaze of vineyard-workers, wotting not
Yon trader was the Lord of Heathenesse.
All day he rode; yet at the wane of day
No gleam of gate, or ramp, or rising spire,
Nor Tessin's sparkle underneath the stars
Promised him Pavia; but he was 'ware
Of a gay company upon the way,
Ladies and Lords, with horse, and hawk, and hound,
Cap-plumes and tresses fluttered with the stir
Of merry race for home. "Go!" said the King
To him that rode upon his better hand,
"And pray these gentlemen of courtesy
How many leagues to Pavia, and the gates,
What hour they close them." Then the Saracen
Set spur, and being joined, to him that showed
First of the hunt, he said his message—they
Checking the jangling bits, and chiding down
The unfinished laugh to listen—and by this
Came up the King, his bonnet in his hand,
Theirs doffed to him: "Sir Trader," Torel said
(Messer Torello 'twas, of Istria),
"They shut the Pavian gate at even-song
And even-song is sung." Then turning half,
Muttered, "Pardie, the man is worshipful,
A stranger too!" "Fair Lord!" quoth Saladin,
"Please you to stead a weary traveller,
Saying where we may lodge, the town so far
And night so near." "Of my heart, willingly,"
Made answer Torel, "I did think but now
To send my knave an errand—he shall ride
And bring you unto lodgement—oh! no thanks,
Our Lady speed you!" Then with whispered hest
He named their guide and sped them. Being gone,
Torello told his purpose, and the band,
With ready zeal and loosened bridle-chains,
Sped for his hunting-palace, where they set
A goodly banquet underneath the planes,
And hung the house with guest-lights, and anon
Welcomed the wondering strangers, thereto led
Unwitting by a world of winding paths:
Messer Torello, at the inner gate,
Waiting to take them in—a goodly host,
Stamped current with God's image for a man
Chief among men—truthful, and just, and free.
Then he, "Well met again, fair sirs! Our knave
Hath found you shelter better than the worst.
Please you to leave your selles, and being bathed,
Grace our poor supper here." Then Saladin,
Whose sword had yielded ere his courtesy,
Answered, "Great thanks, Sir Knight! and this much blame,

You spoil us for our trade :—two bonnets doffed,
And travellers' questions holding you afield,
For these you give us this." "Sir ! not your meed,
Nor worthy of your breeding ; but in sooth
Such is not out of Pavia." Therewithal
He led them to fair chambers decked with that
Makes tired men glad—lights, and the marble bath,
And flasks that sparkled, solid amethyst,
And grapes, not dry as yet from morning dew.
Thereafter at the supper-board they sat,
Nor lacked it, though its guest was reared a king,
Worthy provend in crafts of cookery,
Pastel, pasticcio—all set forth on gold ;
And gracious talk and pleasant courtesies,
Spoken in stately Latin, cheated time
Till there was none but held the stranger-sir,
For all his purfled robe of cramasie,
Goodlier than robes could show him. Presently
Talk rose upon the Holy Sepulchre.
"I go myself," said Torel, "with a score
Of better knights—the flower of Pavia—
To try our steel against King Saladin's.
Sirs ! ye have seen the countries of the Sun,
Know you the Soldan ?" Answer gave the King,
"The Soldan we have seen—'twill push him hard
If, which I nothing doubt, your Pavian lords
Are valorous as gentle ;—we, indeed,
Are Cyprus merchants making trade to France—
Dull sons of Peace." "By Mary !" Torel cried,
"But for thy speech, I ne'er heard speech so fit
To lead the war, nor saw a hand that sat
Liker a soldier's in the sabre's place,
But sure I hold you sleepless !" Then himself
Playing them chamberlain, with torches borne,
Led to their restful beds, commending them
To sleep and God, who hears, Allah or God,
When good men do his creatures charities.
At dawn the cock, and neigh of saddled steeds
Broke the King's dreams of battle—not their own,
But goodly jennets from Torello's stalls,
Caparisoned to bear them : he their host
Up—with a gracious manner like the dew—
To bid them speed. Beside him in the court
Stood Dame Adalieta : comely she,
And of her port as stately, and as sweet
As if the threaded gold about her brows
Had been a crown. Mutual good-morrow given,
Thanks said and stayed, the lady prayed her guest
To take a token of his sojourn there,
Marking her good-will, not his worthiness ;
"A gown of miniver—these furbelows
Are silk I spun—my lord wears ever such—
A housewife's gift ! but those ye love are far;
Wear it as given for them." Then Saladin :
"A princely gift, Madonna, past my thanks;
And—but thou shalt not hear a 'no' from me—
Past my receiving—yet I take it : we
Were debtors to your noble courtesy
Out of redemption—this but bankrupts us."
"Nay, sir,—God speed you !" said the knight and dame.
And Saladin, with phrase of gentilesse
Returned, or ever that he rode alone,
Swore a great oath in guttural Arabic—
An oath by Allah—startling up the ears
Of those three Christian cattle they bestrode,
That never yet was nobler-natured man,
Nor statelier lady ;—and that time should see
For a king's lodging quittance royal repaid.

PART II.

It was the day of the Passaggio :
Ashore the war-steeds champed the gimmal-bit;
Afloat the galleys tugged the mooring-chain—
Waiting their loads ; the Lombard armourers,
Red-hot with rivetting the helmets up,
And whetting axes for the heathen heads,
Cooled in the crowd that filled the squares and streets
To speed God's soldiers. At the none that day
Messer Torello to the court came down,
Leading his Lady ;—sorrow's hueless rose
Grew on her cheek, and thrice the destrier
Struck fire, impatient, from the pavement-squares,
Or ere she spoke, tears in her lifted eyes,
"Goest thou, lord of mine ?" "Madonna, yes !"
Said Torel, "for my soul's weal and the Lord
Ride I to-day : my good name and my house
Reliant I entrust thee, and because
It may be they shall slay me, and because
Being so young, so fair, and so reputed,
The noblest will entreat thee—wait for me,
Widow or wife, a year, and month, and day ;
And if thy kinsmen press thee to a choice,
And I be not come, hold me for dead :
Nor link thy blooming beauty with the grave
Against thine heart." "Good, my lord !" answered she,
"Hardly my heart sustains to let thee go ;
Thy memory it can keep, and keep it will,
Though my one lord, Torel of Istria,
Live, or—" "Sweet, comfort thee ! San Piero, speed,
I shall come home : if not, and worthy knees
Bend for this hand, whereof none worthy lives,
Least he who lays his last kiss thus upon it,
Look thee, I free it—" "Nay !" she said, "but I,
A petulant slave that hugs her golden chain,
Give the gift back, and with it this poor ring :
Set it upon thy sword-hand, and in fight
Be merciful and win, thinking on me."
Then she, with pretty action, drawing on
Her ruby, buckled over it his glove —
The great steel glove—and through the helmet bars
Took her last kiss ;—then let the chafing steed
Have his hot will and go.
But Saladin,
Safe back among his lords at Lebanon,
Well wotting of their coming, waited it,
And held the crescent up against the cross.
In many a doughty fight Ferrara blades
Clashed with keen Damasc, many a weary month
Wasted a-field ; but yet the Christians
Won nothing nearer to the sepulchre ;
Nay, but gave ground. At last in Acre pent,
On their loose files, enfeebled by the war,
Came stronger smiter than the Saracen—
The deadly Pest : day after day they died,
Pikeman and knight-at-arms : day after day
A thinner line upon the leaguered wall
Held off the heathen :—held them off a-space ;
Then, over-weakened, yielded, and gave up
The city and the stricken garrison.
So to sad chains and hateful servitude
Fell all those purple lords—Christendom's stars,
Once high in hope as soaring Lucifer,
Now low as sinking Hesper : with them fell
Messer Torello—never none so poor
Of all the hundreds that his bounty fed
As he in prison—ill-entreated, bound,
Starved of sweet light, and set to shameful tasks ;
And that great load at heart to know the days
Fast flying, and to live accounted dead.
One joy his gaolers left him,—his good hawk ;
The brave, gay bird that crossed the seas with him :
And often in the mindful hour of eve,
With tameless eye and spirit masterful,
In a fine anger checking at his hand,
The good grey falcon made his master cheer.

One day it chanced Saladin rode a-field
With shawled and turbaned Emirs, and his hawks,
Barbary-bred, and mewed as princes lodge,
Flew foul, forgot their feather, hung at wrist,
And slighted call. The Soldan, quick of wrath,
Bade slay the cravens, scourge the falconer,
And seek some wight that knew the heart of hawks,
To keep it hot and true. Then spake a Sheikh:
'There is a Frank in prison by the sea,
Far-seen therein." "Give word that he be brought,"
Quoth Saladin, "and bid him set a cast:
If he hath skill, it shall go well for him."
Thus by the winding path of circumstance
One palace held, as prisoner and prince,
Torello and his guest. Unwitting each,
Nay and unwitting, though they met and spake
Of this goshawk and this—Signors in serge—
And Chapmen crowned, who knows?—till on a time
Some trick of face, the manner of some smile,
A gleam of sunset from the glad days gone
Caught the king's eye, and held it. "Nazarene!
What nation art thou?" asked he. "Lombard I,
A man of Pavia." "And thy name?" "Torel,
Messer Torello known in happier times,
Now best unknown." "Come hither, Christian!"
The Soldan said, and led the way, by court,
And hall, and fountain, to an inner room,
Rich with kings' robes: therefrom he reached a gown,
And "Know'st thou this?" he asked. "High lord! I might
Elsewhere," quoth Torel, "here 'twere mad to say
Yon gown my wife unto a trader gave
That shared our board." "Nay, but that gown is this,
And she the giver, and the trader I,"
Quoth Saladin; "I, thrice a king to-day,
Owing a kingly debt and paying it."
Then Torel, sore amazed, "Great lord, I blush,
Remembering the Master of the East
Lodged sorrily." "It's master's master thou!"
Gave answer Saladin. "Come now and see
What wares the Cyprus traders keep at home;
Come now and take thy place, Saladin's Friend."
Therewith into the circle of his lords,
With gracious mien the Soldan led his slave,
And while the dark eyes glittered, seated him
First of the full divan. "Orient lords,"
So said he,—"let the one who loves his king
Honour this Frank, whose house sheltered your king,
He is my brother:" then the night-black beards
Swept the stone floor in ready reverence,
Agas and Emirs welcoming Torel:
And a great feast was set; the Soldan's friend
Royally garbed, upon the Soldan's hand
Shining, the one star of the banquetters.

PART III.

All which, and the abounding grace and love
Shown him of Saladin, a little held
The heart of Torel from its Lombard home
With Dame Adalieta: but it chanced
He sat beside the king in audience,
And there came one who said: "My lord the king,
That galley of the Genovese which sailed
With Frankish prisoners is gone down at sea."
"Gone down!" cried Torel. "Ay! what recks it, friend,
To fall thy visage for?" quoth Saladin,
"A galley less to ship-stuffed Genoa!"
"Good, my lord!" Torel said, "It bore a scroll
Inscribed to Pavia, saying that I lived;
For in a year, a month, and day, not come,
I bade them hold me dead—and dead I am,
Albeit living, if my lady wed
Perforce constrained." "Certes," spake Saladin,
"A noble dame—the like not won, once lost—
How many days remain?" "Two days, my prince,
And twelve-score leagues between my heart and me:
Alas! how to be passed?" Then Saladin:
"Lo! I am loath to loose thee—wilt thou swear
To come again if all go well with thee,
Or come ill speeding?" "Yea, I swear, my king,
Out of true love," quoth Torel, heartfully.
Then Saladin: "Take here my signet-seal;
My admiral will loose his swiftest sail
Upon its sight, and cleave the seas, and go
And clip thy dame, and say the Trader sends
A gift, remindful of her courtesies."
Passed were the year, and month, and day; and passed
Out of all hearts but one Sir Torel's name,
Long given for dead by ransomed Pavians.
And Pavia, thoughtless of her Eastern graves,
A lovely widow, all too gay for grief,
Made peals from half a hundred campaniles
To ring a wedding in. The seven bells
Of San Piero from the nones to noon,
Boomed with bronze throats the happy tidings out;
Till the great tenor, overswelled with sound,
Cracked himself dumb. Thereat the sacristan,
Leading his swinkèd ringers down the stairs,
Came blinking into sunlight—all his keys
Jingling their little peal about his belt.
Whom, as he tarried, locking up the porch,
A foreign signor, browned with southern suns,
Turbaned and slippered, as the Moslems use,
Plucked by the cope. "Friend," quoth he—'twas a tongue
Italian true, but in a Moslem mouth—
"Why are your belfries busy—is it peace
Or victory, that so ye din the ears
Of Pavian lieges?" "Truly, no liege thou!"
Grunted the sacristan, "who knowest not
That Dame Adalieta weds to-night
Her fore-betrothed,—Sir Torel's widow she,
That died i' the chain?" "To-night!" the stranger said.
"Aye, sir, to-night!—why not to-night?—to-night!
And you may see a goodly Christian feast
If so you pass their gates at even-song,
For all are asked."
No more the questioner,
But folded on his face the Eastern hood,
Lest idle eyes should mark how idle words
Had struck him home. "So quite forgot!—so soon!—
And this the square wherein I gave the joust,
And that the loggia, where I fed the poor;
And you my palace, where—oh, fair! oh, false!—
They robe her for a bridal. May it be?
Clean out of heart, with twice six changeful moons,
The heart that beat on mine as it would break,
That faltered forty oaths. Forced! forced!—not false—
Yea, I will sit, Wife, at thy wedding feast,
And let mine eyes give my fond faith the lie."
So in the stream of gallant guests that flowed
Feast-ward at eve, went Torel—passed with them
The outer gates—crossed the great courts with them
A stranger in the walls that called him lord.
Cressets and coloured lamps made the way bright,
And rose-leaves strewed to where, within the doors
The master of the feast, the bridegroom, stood,
A-glitter from his forehead to his foot,
Giving fair welcomes. He, a courtly lord,
Marking the Eastern guest, bespoke him fair,

Prayed place for him, and bade them set his seat
Upon the dais. Then the feast began,
And wine went free as wit, and music died—
Outdone by merrier laughter :—only one
Nor eat, nor drank, nor spoke, nor smiled,—but
gazed
On the pale bride, pale as her crown of pearls,
Who sate so cold, and still, and sad of cheer,
At the bride-feast.
But of a truth, Torel
Read the thoughts right that held her eyelids down,
And knew her leal to her memories.

Then, to a little page who bore the wine,
He spake : "Go tell thy Lady thus from me :
In mine own land, if any stranger sit
A wedding guest—the bride, out of her grace,
In token that she knows her guest's good-will,
In token she repays it, brims a cup,
Wherefrom he drinking, she in turn doth drink.
So is our use." The little page made speed
And told the message. Then that lady pale—
Ever a gentle and a courteous heart—
Lifted her troubled eyes, and smiled consent
On the swart stranger. By her side, untouched,

Stood the brimmed gold. "Bear this," she said,
"and pray
He hold a Christian lady apt to learn
A graceful lessson." But Sir Torel loosed
From off his finger—never loosed before—
The ring she gave him on the parting day ;
And ere he drank, behind his veil of beard
Dropped in the cup the ruby, quaffed, and sent.—
Then she, with sad smile, set her lips to drink,
And something in the Cyprus touching them,
Glanced—gazed—the ring !—her ring !—Jove ! how
she eyes

The wistful eyes of Torel !—how, heartsure,
Under all guise, knowing her lord returned,
She springs to meet him coming !—telling all
In one great cry of joy.
Oh, me ! the rout,
The storm of questions, stilled, when Torel told
His name, and, known of all, claimed the Bride Wife.
Maugre the wasted feast, and woeful groom,
All hearts but his were light to see Torel :
But Adalieta's lightest, as she plucked
The bridal-veil away. Something therein—
A lady's dagger—small, and bright, and fine,

Clashed out upon the marble. "Wherefore that?"
Asked Torel. Answered she: "I knew you true;
And I could live, so long as I might wait;
But they—they pressed me hard; my days of grace
Ended to-night—and I had ended too,
Faithful to death, if so thou hadst not come."

EDWIN ARNOLD.

THE SUCTION POST.

Having read an article in one of your numbers for July, 1860, upon the "Suction Post," which interested me much in the undertaking; and having recently received an invitation from the Pneumatic Despatch Company (Limited), to view the experiments on about 500 yards of tube laid down at Battersea, I took advantage of a fine afternoon, and proceeding to Hungerford Bridge, was at once conveyed with as much rapidity as was possible for a penny steam-boat, to Battersea Pier. On arriving there, I observed a long iron tube, about eighteen inches in diameter, trailing along the side of the river, looking like some sea-serpent that Father Thames had stranded on his banks: this was the Pneumatic tube. Having watched with great interest a car drawn into it from the starting-point, I proceeded to the arrival end, where the engine-house was situated, and where I found the civil engineer, who thoroughly deserves his title, for his polite attention and kindness in explaining the *modus operandi* to me.

Having expressed a desire to become myself a passenger by this miniature railway, the engineer informed me that although not actually meant for passenger traffic, it could easily accommodate itself to that purpose, if I would return to the starting-point, and place myself in one of the parcel cars, which I accordingly did; and being compelled to recline myself at full length on a couch of gravel-bags, with which the cars were partially filled, for the purposes of the experiments which were being made. As soon as I had thus placed myself, the car was partially pushed into the tube, leaving just my head exposed to the gaze of my surrounding friends, who, whilst I was in this position, assailed me with cheering observations, such as whether I had made my will previous to starting, and who was to be the lucky legatee, in case of my never seeing daylight again in my present shape, of which they assured me there was little probability. My feelings at this time were, I should imagine, somewhat similar to those of a boy tied up in a sack with his head free, and being tickled by his loving schoolfellows with a straw. I had only just time to make a gracious reply to the kindly inquiries, when I felt myself being sucked down the throat of the serpent, and in another instant was whirling along at what appeared to me lightning speed; but which, in reality, was about a quarter of a mile in fifty seconds, but this was a great reduction, on my account, of the ordinary speed. A large quantity of dust which was, I suppose, drawn in with the car, was blowing over me throughout my brief journey, which, combined with there being no springs to the car, was the only unpleasantness I experienced. There was a cooling rush of air over my face the whole time, which if it had not been mixed with the before-mentioned dust would have been very agreeable.

My fancies during my very rapid passage were of a novel character. I bethought me of the description in the second Æneid of the Grecian horse of old with its living bowels, and was reminded by the whirring noise and great reverberation of the line:

Insonuere cavæ gemitumque dedere cavernæ.

Then the idea of coming to a dead stop in the middle of the tube, and spending the afternoon there, suggested itself, but was dispelled on remembering that the engineer had told me that in case of such a mishap, which could only occur through some derangement of the pumping-engine, a workman could be sent in on his hands and knees to hook on a rope to the car, which could then easily be pulled out. But I had not time for much reflection before I felt the speed slackening slightly, and after turning a sharp curve in the tube, that brought me into the engine house, I was released, after a slight pause, by the guardian angels, alias pneumatic workmen, who watch over the trap-door (that fastens the end of the tube), and the car rolled slowly out amidst a small crowd of interested spectators, who apparently seemed most intensely disappointed that I did not appear in a mangled or otherwise injured state. I don't know if the expectant legatee was amongst the number. I was instantly surrounded by this crowd, who, in a very affectionate manner, considering the shortness of our acquaintance, begged me to describe my sensations generally during my novel passage, which, though possessing much natural amiability of disposition, I was unable to do to the satisfaction of all, so will refer them to this account instead.

The purposes and advantages of this scheme were so amply explained in your previous article,* that it is quite unnecessary for me to add another word.

H. N. P.

OUR FIRST ENGLISH REGATTA.

It is August,—Parliament is up,—battles, murders, and sudden deaths do not suit the dog-days,—it takes all the graphic powers of a Russell to excite an interest in the mad doings of our cousins across the Atlantic, and we turn with pleasure from the columns in which the word "America" appears in large letters associated with all the horrors of a fratricidal war, to where we see the same four syllables in humbler guise under the heading of "Intelligence from Cowes," and learn that the far-famed schooner of that name has sailed, and lost, a match with the Alarm. There is something refreshing in the very thought of a regatta at this hot season, and though the unequal distribution of Fortune's favours may not allow us to sail our own yachts, we can at least derive enjoyment from inhaling the invigorating breezes of old Ocean, as seated upon the shore we watch with dreamy interest the sport which is made for us by those who do.

An ocean separates us from anarchy and bloodshed; in the face of this glorious summer sun sea-girt old England, clad in her golden robes of

* See Vol. III., p. 130.

harvest, looks up and smiles. Let us too look up with thankfulness and joy, for many and great are the blessings which surround us, and, in the midst of peace and plenty, gratitude is due to Him who is the giver of all good gifts.

Such were our thoughts a few days since, as seated upon the shores of the Solent, a signal gun from the yacht club battery at Cowes announced to those deeply interested in the race that the Arrow had gained a victory over her rivals, the Osprey and Brunette. The scene was one of surpassing loveliness at the moment; sea, land, and sky seemed to borrow beauty from each other; the waters of the Solent teemed with life, and as yacht followed yacht, with white sails standing out in bold relief against the shores, it required but a slight stretch of fancy to imagine how naturally such a sight, seen for the first time, would inspire the spectator with feelings of indescribable awe; such as was felt by the natives of the new world when they saw the "winged monsters" of Columbus gliding mysteriously towards them, over their, till then, lonely seas, and bearing, as they fondly believed, beings belonging to a heaven-born race. Ah! could they but have foreseen the degradation, bitterness, and woe which was to follow in the train of those they thus welcomed—the bearers of that sacred cross which was to typify the sacrifice of One who came down from on high to proclaim peace on earth and good will towards men, how changed had been the scene depicted by the poet!

> "Nymphs of romance,
> Youths graceful as the faun, with eager glance,
> Spring from the glades, and down the alleys peep,
> Then headlong rush, bounding from steep to steep,
> And clasp their hands, exclaiming as they run,
> "Come and behold the children of the sun!"

But whilst ocean remains the same, how great the change in all she bears upon her bosom. Man no longer fears her darkest frown; science has bid him conquer, and through her aid nor storm nor calm can turn him from his course. Where it will end we know not. We marvel at the present, but what marvels may there not be in store for those who follow after?

But what has all this to do with a regatta?—more than would at first appear; for what we have just written is nothing less than the excavation of the dock in which the keel of the structure we are about to build is to be laid, and it is thy ignorance, O reader, or thy impatience which thus perverts thy judgment, and prevents thy being cognizant of so grave a fact.

Be thankful that in these preliminary remarks, we have not, as some writers do, made the beginning of the world our starting point. We have but gone back to Columbus, and how were it possible for us to omit a reference to the great Genoese navigator, when the ocean and America were in our thoughts. Subjects, these, which naturally associate themselves with the matter we have in hand, for on the 19th April, 1775, there was fighting in America. At Lexington the first blood was spilt in the great contest which was to deprive Great Britain of the largest portion of her Empire in the Western world; and on the 23rd of June in the same year, whilst Great Britain's soldiers, in tight spatterdashes and cocked hats, with hair powdered and "albemarled" in accordance with the regulations of the military martinets, were struggling under Gage against the undisciplined, unpowdered levies of the "Confederate States," all the good citizens of London, headed by the "beau ton" of those formal corrupt old days, were swarming the banks of Father Thames to see the first regatta.

"The first entertainment of the kind in England," says the Annual Register of that date; and from the same authority we learn that it "was borrowed from the Venetians, and exhibited partly on the Thames, and partly at Ranelagh."

Novelties in the year 1775 did not succeed each other quite so quickly as in these more favoured times; the want of something new was consequently more deeply felt. The appetite for amusement was not one whit less sharp, but though it could be satisfied with simpler fare, the palate of the public sometimes required to be stimulated; and so it was that some ingenious caterer for the public wants bethought himself of this new sport from Venice, and in proof of his discernment, on the 23rd June, 1775, all the sight-seeing world of London were to be found standing on the very tip-toe of expectation to see this great regatta.

The 23rd was on a Friday. The bells of St. Mark ushered in the morning of the long-looked-for show with a merry peal, whilst later in the day St. Margaret's rang out her happiest chimes. On the river all was bustle and confusion. Barges belonging to the different companies and pleasure-boats were moving to and fro. Flags and gay streamers fluttered in the breeze. From London bridge to Millbank was one moving mass of boats and barges; the splendour of the scene increasing as we moved towards Westminster, where prominent amongst other striking objects was a river barge, "filled with the finest ballast in the world—above 100 elegant ladies."

"Above 1200 flags were flying before four o'clock, and such was the impatience of the public, that scores of barges were filled at that time," though half-a-guinea was asked for a seat in one of them. Scaffolds were erected in the barges, on the banks of the river, and even on the top of Westminster Hall; all of which were crowded with spectators. The bridges were covered with crowds in carriages and on foot, men even placing themselves in the bodies of the lamp irons. Before six o'clock it was a perfect fair on both sides of the water, and—we are told—bad liquor with short measure was plentifully retailed, whilst in order that there should be no lack of additional excitement for those who might require it, the avenues leading to Westminster bridge were covered with gaming tables.

Six o'clock and no regatta! The impatient public must have pricked their ears when from under the arches of the bridge at Westminster, they heard the sound of "drums, fifes, horns, trumpets, &c." This was followed by a round of cannon from a platform before the Duke of Richmond, "who, with his Grace of Montague, and the Earl of Pembroke, had splendid companies on the occasion."

At half-past seven there is a stir upon the river; and my Lord Mayor's barge sweeping down in great state, twenty-one cannon are fired as a salute; and then, just before my Lord Mayor's barge reached the bridge, to which it had made a circle, "the *wager-boats* started, on the signal of firing a single piece of cannon." They are said to have been absent some fifty minutes, and "on their return the whole procession moved with a picturesque irregularity towards Ranelagh." We hear no more of these "wager-boats;" it is evident that the interest of those who came to see the show was not centred in them, and we can but exclaim with all true lovers of aquatics, "O monstrous! but one halfpennyworth of bread to this intolerable deal of sack!"

But all the world has moved up the river, the Thames has become a floating town, everything —from "a dung-barge to a wherry"—is in motion; let us on to Ranelagh!

We land with the company on the stairs at nine o'clock, and share their disappointment when, on proceeding to join the assembly which has come by land in the Temple of Neptune, we find that the Ocean God, wrathful perhaps at his musicians having been attired in "sylvan suits," has thrown obstacles in the way of our amusement—for his temple is not yet swept out or even ready—so that we have to defer our intended cotillons till after supper. This takes place at half-past ten, in the Rotunda, where, whilst we refresh ourselves at one of three circular tables of different elevations, "elegantly set out though not profusely covered,"—an imitation of which style may be seen in the diners à la Russe of the present day, our ears are regaled by an orchestra of 240 performers, "in which are included some of the first masters," led by Giardini. But though a spell of enchantment is cast around us by the bewitching singing of "Messrs. Vernon, Reinhold, &c. &c.," the appearance of the orchestra has in itself a lugubrious effect, "for its illumination has been unfortunately overlooked."

Supper being over, we withdraw to the Temple of Neptune, and though we have very great personages amongst us, for there are their Royal Highnesses the Dukes of Gloucester and Cumberland, the Duke of Northumberland, Lords North, Harrington, Stanley, Tyrconnel and Lincoln, with their respective ladies; also Lords Lyttelton, Coleraine, Carlisle, March, Melbourne, Cholmondeley, Petersham, &c., and the French, Spanish, Russian and Prussian Ambassadors,—we dance minuets and cotillons, without regard to precedence, till a late hour.

The weather is not favourable to out-door amusements, so that the bridges and palm-trees which were erected in the gardens are lost upon us, and the illuminations with which they were to have been accompanied are not exhibited; so we dance on till we are thoroughly tired, and then home, well pleased, though somewhat puzzled, with our first regatta.

As we walk homeward we hear a lusty voice chaunting one of the eleven verses of the ballad composed in honour of the occasion, and which had brought down thunders of applause in the Rotunda:

"Enough of festinos, champêtres enough,
Bal-parés, and frescos, and such worn-out stuff,
But how to amuse ye? Ay, there was the question.
A regatta was thought of—oh, lucky suggestion!"
Derry down.

The refrain is taken up by numberless voices in a variety of keys, and, if there be a want of harmony, it is not because our own voices remain silent. G. G. A.

OUR FIRST CURATE.

On the middle of a wild uncultivated moor in the north of England is situated a small village, which shall be nameless, although the mention of its veritable name would give small enlightenment to most readers. In these days of steam and perpetual motion there are indeed but few corners of the world which remain a *terra incognita*, but this is, I believe, one of them; at all events at the time of which I am about to write,—the time of my youth, now alas! numbered with the past. the spot was unvisited save by the snow and sleet in the winter season, and when these had melted and gone, came only the purple heather flowers, glowing beneath the summer sunshine far as the eye could reach.

Here, in the parsonage, my two sisters and myself were born. We lost our mother early, too early to be sensible of our loss; and our father never brought any one to supply her place to us, either in the shape of step-mother or governess. We learnt our alphabet and earliest lessons at his knee, and as we grew older he it still was who taught us all we ever knew. Thus we grew up not exactly ignorant, but unaccomplished, and shy to a degree. Of this shyness each had her own characteristic manifestation. Sarah, the eldest of us, was affected by a nervous cough and contraction of the eyebrows at the sight of a stranger; the same phenomenon induced a tremor through my whole frame more nearly resembling St. Vitus's dance than anything else; while Rose, our youngest sister, blushed a deeper red than the reddest of her namesakes in the garden. In spite, however, of all our shyness, although the scent of a tailed coat, or the sight of a hat other than our father's in the hall, sent us off with the speed of lightning, like frightened mice to our hiding-places —the most inscrutable nooks and crannies in all the house — of course, in spite of this, we had our own private romances; we each of us were to have a lover some day; some bright being— wearing hat and coat, I suppose, but himself hardly made of mortal clay—was to fall down straight from the clouds, or perhaps to "*slither* down a rainbow" at our feet; this being bright— or rather these beings, for there were to be three of them—were to declare their love, a passion pure, ethereal, rapturous, such as earth before had never known, which should be reciprocated electric-like on the instant, and then shyness should be no more, reserve should be swallowed up in confidence, and there should be but one heart, one mind, one soul between us.

Such was our first dream of love, a dream altogether dream-like and unsubstantial; by and by, however, we began to indulge in some little

curiosity as to what our lovers should personally be like; and when we chanced to hear that in the town nearest to us there lived an old woman who showed to people through a glass the forms of the future rulers of their destiny, we determined to pay her a secret visit. Papa must not know anything about it, nor anybody in the world except Mary, the old servant, who had told us the story—she would go with us. It was a long way, more than six miles off, that little town of B——, and the sun was scorchingly hot as we crossed the wild unsheltered moor that summer afternoon; but our feet did not tire nor our spirits flag. We reached the old woman at last; very old she looked—nearly a hundred to our eyes—and her antique dress and hollow sepulchral tones exactly embodied our imaginations of the Sibyl. The magic mirror, an ordinary prism to all appearance, was produced, and Sarah invited to look steadily into it. Wonderful to relate, she declared she beheld a gentleman whom she had never seen before, very tall, very long in the back, small enough in the waist to hint a suspicion of stays, having the tiniest darlings of feet and of hands, jet black hair and whiskers, and a profile exactly in accordance with that of a Greek statue. Encouraged by what I heard of this delightful apparition, I now took the crystal from Sarah's hand, but alas! look as long and earnestly as I would, it reflected nothing for my eyes but the colours of the rainbow, a phenomenon belonging, as I thought, rather to the science of optics than to that of magic. Vainly I asked the Sibyl whether she portended an early death for me, or —fate yet more cruelly unkind—life as an old maid, from this vacuity of vision: she did but shake her head, a shake big, doubtless, with significance as Lord Burleigh's, only the wisdom that should interpret it failed me. Thus was my fate left undecided, and Rose essayed her turn. Her description resembled Sarah's so exactly, that I settled it my sisters must be the destined brides of two brothers, probably twins—the statuesque profile, tall figure, small waist, delicate hands and feet, all presented themselves a second time, only Rose's Adonis had light hair instead of dark, and no whiskers at all.

More than two years passed away without bringing anyone to our village in the least degree like the phantoms of the mirror, and our village was our world, having never any of us travelled further from it than that little town of B—— I have mentioned before, in all our lives. Sarah was now twenty-one, I a year and a half younger, and Rose just eighteen. One day papa—but I must pause a moment first to describe what sort of man our father was. In person he was indisputably handsome, and mentally as indisputably clever. I don't know whether it was from choice or from the necessity of the case during those more than twenty years he had held the living of —— on the Moor, but he saw scarcely any society at home, and never went out. His income was small, by the way, and did not justify his keeping a carriage. He occupied himself chiefly with literary pursuits, had contributed, as we knew, articles to several of the reviews, and at the present time we imagined him to be engaged on some greater work, though he had never spoken of it to us. Now I can return to my "one day." One day, then, papa took us all by surprise by announcing that he was going to keep a curate. The parish was very small—the emolumen , as I have said before, also small—there was but one full service on Sunday, and very little occasional duty—a few babies were born and wanted baptising, it was true—but a burial was rare, and a wedding almost unheard of—what *could* papa want with a curate?

"I may tell you," he said, in answer to our inquiry, which was looked though not spoken, "that I am writing a work—a great work," he added rather pompously—"one which, I trust, will be acknowledged as such by future generations, and which I would fain, therefore, finish before I die. For this purpose, I have resolved to devote myself entirely to my literary labours, and have engaged as curate a young man who will take the whole of the parish-work off my hands. As I give him a title, he is satisfied with a small stipend. His name is Pembroke, and I expect him immediately after the Easter ordination. He will lodge at Mrs. Shipton's."

This information being vouchsafed us about the middle of Lent, we had full employment for the remaining two or three weeks in talking over the great prospective event; not the fate of kingdoms to the statesman, nor that of universal science to the philosopher, could be bigger with interest than was the advent of this curate to us three country girls. Sarah and Rose had each the hope of discovering her crystalline hero—or hero of the crystal I should, perhaps, rather say—and, though my interest was not so personal, it was none the less keen in my sisters' behalf.

"I am afraid he won't be comfortable at Mrs. Shipton's," said Sarah, "the rooms are so small and the furniture so mean. Don't you think we might send a few pictures to cover the walls?"

"Or rather the paper that is upon the walls," suggested Rose. "Those dreadful blue roses with the scarlet leaves. Of course we might. And I am sure we could spare one of the couches from our own morning-room, and—"

"You need not dispose of any more articles of our furniture in your fancy, Rose," I interrupted; "we might spare, indeed, but we could never send them. Mrs. Shipton thinks her rooms fit for a prince, and would be mortally offended if we insinuated they were not fit for a curate, to reckon nothing of what the curate himself and papa would say and think when they discovered, which, of course, they would do, that we had carried out your plan."

My arguments were not to be gainsayed, so Mrs. Shipton's wonderful blue roses suffered no eclipse, and her hard-seated horsehair chairs admitted no dangerous rival in their midst in the shape of our more luxurious sofa.

Easter Sunday came at last, and the Thursday after came Mr. Pembroke. The next day he called at the parsonage, and, after being for some time closeted with papa, was conducted by the latter to the drawing-room, to be introduced to his daughters three. We heard, with beating hearts, their footsteps approaching. The door opened.

"My daughters—Mr. Pembroke," said papa.

Sarah's cough was distressing as she rose from her seat, and my legs trembled so that my curtsey —self-taught, by the way, for we had never had the benefit of a dancing-master—was quite a failure. I glanced at Rose: her cheeks were scarlet. And what was the colour of Mr. Pembroke's hair? It might have been green as Mr. Tittlebat Titmouse's when he had made use of the infallible dye, for anything I knew to the contrary, for full five minutes after my introduction.

The new curate began by offering a few remarks on the weather and his first impressions of the country, in a voice rather too loud for a drawing-room, but not unmusical. These were answered by Sarah in monosyllables, strangled in the birth by coughs. At length I took courage to look up. What colour was it? Black—black as the raven's wing. This must then be he whom fate had predestined for my sister Sarah. Behold, the sympathetic chord was already touched in his bosom—he was inquiring anxiously about her cough.

"I am distressed to hear you cough so," he said; "have you suffered in this way long, Miss Seaton?"

Sarah's reply was completely choked.

"Yes, my daughter is subject to a cough," said papa; "but I have seldom heard it so bad as this morning."

"I believe cod-liver oil is the best remedy," resumed the curate: "wonderful cures of long-standing disease are well authenticated to have been wrought by it."

Long standing disease and cod-liver oil! Poor Sarah, this was a pleasant prelude to love-making! Papa resented it for her.

"My daughter's lungs are quite sound, I am happy to say," he remarked, in a tone which forbade anything further to be said on the subject; and Mr. Pembroke, after bestowing one more pitying glance on Sarah, began to talk of something else. He asked us if there were many pretty walks in the neighbourhood. This time it was Rose who answered. She was an artist; knew the whole length and breadth of the moor; had witnessed the different effects of sunrise, sunset, and the sun at his meridian on its broad rugged features; and she spoke with enthusiasm in its praise.

"Ah, *you* look strong," said Mr. Pembroke, with a scarcely perceptible emphasis on the pronoun, which, however, papa did not appear to notice, for he observed, smiling:

"Ah! you judge by her colours, I see. Rose does not, however, always hoist such a crimson flag."

A suggestion of consumption again under the diagnosis of the hectic flush I thought to myself, and I half expected to hear a second recommendation of the infallible cod-liver oil. But Mr. Pembroke was wiser: he might think these poor motherless girls were following their deceased parent at a galop to the churchyard, but he kept both pitying word and look to himself this time, and after a few more now-forgotten observations on matters irrelevant, rose to take his leave, papa accompanying him to the gate.

"Well, Sarah, is it he?" was my eager inquiry, as soon as we three sisters were alone.

"The very same," she replied, confidently.

"It struck me, however, that Mr. Pembroke's hands and feet were decidedly large—and if you recollect, they were to have been so very small," I remarked, rather maliciously.

"Perhaps his boots and gloves did not fit," suggested Rose.

"Well, I can't answer for the boots, but he took a glove off to shake hands before departing, and I particularly noticed the hand. Mine felt like a child's in the paw of a giant."

"But then, Fanny, you know your hand is so very small," said my sister Sarah, hoping perhaps, by this gentle flattery, to deprecate any further raillery on my part.

"Thank you, Sarah," I returned; "then I must make no more *odorous* comparisons. And there is no mistake that Mr. Pembroke's figure is tall and good, his hair black, his features of the Greek style of architecture, and that altogether he is a very handsome man. Sarah, I congratulate you: that pity is akin to love is well known, and there was, assuredly, ineffable pity in his eye the moment he heard that little cough of yours."

"That horrid cough," began Sarah.

"Say rather most opportune cough," I interrupted. "You don't know what you owe to it. I wonder whether Mr. Pembroke has a brother just like himself, only with light hair," I went on, thinking to turn my artillery now against Rose.

"Oh, of course he has," she answered, laughing, "and of course the light brother will come here to stay with the dark, and everything will happen just as it should do."

"No, indeed Rose; you must not be in such a hurry. Mrs. Shipton's house can never accommodate two lodgers at one and the same time; you must wait for your introduction till Sarah is married, and then she can bring her sister and her brother-in-law so nicely together under her own roof, and you will fall in love with one another as a matter of course."

We did not see Mr. Pembroke again until we saw him in the pulpit the following Sunday morning.

"Much cry and little wool" was papa's verdict on his curate's first sermon, expressed as soon as we were out of hearing of the village congregation, within the garden gates of our own parsonage. "But he is a young hand, and it is to be hoped he will improve. It is sad, however, that pulpit oratory should be so entirely untaught at our Universities," he went on, after a pause.

We were obliged silently to acquiesce in papa's adaption of the old proverb. Mr. Pembroke had a fine voice—one at least which would have rolled sonorously through the cloistered aisles of some large and lofty cathedral. As the poet Wordsworth writes of Harry Gill's,

> His voice was as the voice of three.

But for our little church the sound was all too big, and when I afterwards asked Widow Barber why her little boy cried and behaved so badly that morning, she said it was the parson frightened

him with the awful noise he made. Then, amid all this cry, there was, as papa said, little "wool," neither striking argument, nor lofty thought, nor simple earnest practical lesson. We could but echo his hope of improvement from the bottom of our hearts, convinced it could not be that his future son-in-law should be dismissed from his curacy for mental incapacity.

A few days later papa asked Mr. Pembroke to dine with us, telling him he was sorry he could not invite anybody to meet him, as we never had company at the parsonage. It fell therefore to the curate's lot to lead Sarah to her place at the head of the table that day, and as far as looks went, nobody could deny they were a very suitable and striking pair. She was tall and elegant in figure, and her face, though not exactly beautiful, was interesting, her complexion very fair and pale, her hair luxuriant, and shining like silken threads of gold, and he—but I think I have described him sufficiently before.

Of course Mr. Pembroke did not neglect to inquire of Sarah after her cough; her answer was not in words but in kind, and being unfortunately timed at the moment she was raising a spoonful of soup to her lips, had the result of upsetting the same upon her dress, a light blue silk, which bore the memorial stains to its dying day. Mr. Pembroke's next words were spoken too low to be audible to anybody but Sarah, to whom they were addressed. Actually whispering to her, I thought, so that chrysalis pity is already changing its nature—but alas! I afterwards learnt those few low-breathed syllables had only been "Do let me persuade you to try De Jongh's cod-liver oil." There was very little conversation that day at our dinner-table worthy of being repeated; we girls were far too shy to speak unless we were spoken to; the only spontaneous remark Sarah offered to her right-hand neighbour during the first course, being to ask whether he would take a little more soup, while during the second the same inquiry was hazarded respecting some chickens. Thus the talk was almost exclusively between the two gentlemen.

"I had an old Cambridge friend of your name," said papa, "Pembroke, of Trinity, he was of the same year as myself, and we took orders together, but I have not met nor heard anything of him for many a year. It may be he is a relation of yours: is it possible, your father?"

"My father — no — my father —is — not in orders," returned our curate, with marked confusion of manner and hesitation of voice.

"No,—well certainly, my friend Pembroke in his youth bore no resemblance to you; he was tall, but his figure was much slighter, and his features—"

"My form," interrupted Mr. Pembroke, before papa had time to complete the picture of his old friend, "my form, I have been told by an eminent sculptor, presents the happy medium between the Apollo Belvidere and the Farnese Hercules."

Certainly our new curate was not lacking in vanity, and took small pains to conceal it. It was difficult to preserve one's gravity at this speech; but papa's countenance was a model of decorum as he replied,

"A most just compliment, sir. My poor old friend, on the contrary, would have felt such an one ridiculous applied to himself. His face, too, was what no painter would have chosen as a model for his ideal, though the expression made it beautiful in my eyes."

"Like the sunlight on my moor," remarked Rose, timidly, blushing at the sound of her own voice.

"Ah, expression and sunlight may be all very well in their way, but give me the face and the landscape which are not dependent for their beauty on such adventitious aids." And Mr. Pembroke blew his nose at the conclusion of this observation, by way of sounding a trumpet in praise of its irreproachable Grecian outline.

Papa seemed to think we had now had enough on the subject of personal beauty, and the word "landscape" prompted him to ask his guest if he had travelled much. But Mr. Pembroke had never been *out* of England, and seemed to have found but little worthy of contemplation *in* it, nothing certainly in comparison worthy with his own matchless form and features.

The conversation was next turned by papa upon books, ever his darling theme. He met, however, with no sympathy.

"Ah, books are all very well for monks and hermits," said Mr. Pembroke, "but man in his natural state is a sociable animal, and I acknowledge that my fellow-man has much more interest for me than all the wisdom that ever was printed."

"And all the folly, too, Mr. Pembroke? Don't you care for novels, either?" I ventured to ask.

"Better to *live* romances than to *read* them," replied that gentleman, with a volume of affected sentiment in his tone.

"I am afraid," said papa, dryly, "you will not find the phases of real life so interesting here. We are quite out of the pale of society in this place."

"Is there absolutely no one with whom you can associate in the parish?" inquired Mr. Pembroke dismayed.

"Neither man, woman, or child," returned papa, decisively, "the whole population is composed of labourers and one or two small tenant farmers."

"Surely," expostulated the Curate, "I saw a lady in church on Sunday—two middle-aged and most respectable ladies in fact—with a footman attending them."

"Miss Arabella Green!" we girls exclaimed in chorus, while papa proceeded to give some further account of the lady.

"True," he said; "Miss Arabella Green is, as you remarked, a most respectable lady, who will, I have no doubt, be delighted to welcome you to her house, though I should scarcely imagine her society would be the most agreeable to a young man's fancy." (Miss Arabella Green was, by the way, the ugliest woman I have ever seen in my life; plain, is a term totally inadequate to her description, she was positively and irreclaimably ugly.) "She is very rich," papa went on "and

spends a good deal of her time in travelling, but she has a house of her own in the parish—I dare say you have noticed it—the only one above the rank of a cottage there is,—a great staring red-faced house surrounded by a high garden-wall, about the middle of the village, and here she generally resides for some months in the year. The other lady you noticed with her at church was Mrs. Tweedie, a Scotch widow, and Miss Green's companion, or *chaperone*, as the latter lady herself styles her, although Miss Green would probably appear to you something past the age regarding chaperonage. Once upon a time she was very active in the parish, but I suppose I gave her offence about something or other, for her zeal has these many years past subsided into indifference, while the feeling with which she regards me and my daughters must, I fear, be indicated by a harder name. However, poor lady, she does us no harm, and we can forgive her for it," concluded papa, magnanimously.

Yes, indeed, we could forgive her, whatever might be papa's sentiments; far rather could we girls tolerate Miss Green's enmity than her friendship. We had a suspicion, though we were but children at the time, that Miss Arabella had once designed to change her home at the big ugly red-faced house for our pretty quiet parsonage—to change both home and name at one and the same time.

I have said that our father was a very handsome and a very clever man, and that Miss Arabella was a veritable Gorgon, so let it not be thought so unnatural a thing that a rich maiden should dream of throwing herself away upon a poor parson, a widower, with three gawky daughters for incumbrances. Unnatural or the reverse, it was however our inward conviction that this was the secret spring of all Miss Green's activity in the parish, —of her clothing and sick charities; of her soup bounties on Thursdays; her coals and her blankets at Christmas; and that the hardening of her heart synchronised with the melting away of her matrimonial hopes. Precisely at the same epoch, too, it was, that instead of being greeted as before—with gentle smiles as "sweet darlings"—whenever we chanced to meet Miss Arabella, she brushed past us without a word, and a brow as dark as a thunder-cloud. Of course nothing of all this was related to Mr. Pembroke, but he manifested singular curiosity about the lady, which we endeavoured, in some degree, to gratify. Enough, however, of what passed on this day; time must henceforth move with a swifter wing in my narrative.

Many sermons had now been preached by the new curate in our church, and several dinners eaten by him in our parsonage. Our shyness was diminishing in his presence by small degrees and beautifully less, while Sarah's love was increasing by large ones and horribly larger. Her love, did I say? Nay, let me not dignify with such a name a folly, which, I may say, had "all the contortions" without any of the "inspiration" of the divine passion. Mr. Pembroke's intellect was below mediocrity, his vanity beyond anything ever before met with, his character in no respect loveable, and Rose and I were morally certain, it was impossible our sister really loved him. She had, however, persuaded herself she did, at first sight, because of the fancied resemblance to *him*, whom, as she said, fate had revealed as her future husband, and reason about it as we might, we could not reason her out of her nonsense. Mr. Pembroke meanwhile manifested no symptoms, of contagious disease, and Sarah's were only recognised by our sisterly omniscience. She was, however, looking ill to all eyes, the cause whereof was as follows:

The Curate had one day expressed his admiration of the colour of the larches which ornamented our lawn, and were then just bursting into leaf in all the fresh beauty of the opening spring. From this very simple and natural remark, Sarah had taken it into her head that green was his favourite colour, and in spite of our protest (for nothing could have worse suited her pale complexion), she persisted, from that time forth, in wearing nothing but green. Notwithstanding papa's near-sightedness, and want of observation in such matters, I expected every day he would be remarking how very unwell she looked.

Mr. Pembroke had been with us about six months, when one morning at breakfast papa exclaimed in stronger terms than usual against the poverty, the absolute imbecility, of his sermons. His progress, papa declared, was retrograde rather than advancing, and he concluded by expressing his determination to dismiss Mr. Pembroke at the end of the year for which he had at first engaged him. I watched, on Sarah's countenance, the effect of this announcement, but whatever her feelings were, she managed to disguise them successfully, and for several days afterwards made no allusion to the subject either to Rose or me. About a week had passed, when she came to me in my bedroom, one morning, as I was dressing for a walk, with a face which betokened something on her mind.

"I want to speak to you, Fanny," she began.

"Well, dear, what is it?" I returned, putting my arm round her waist, and kissing her cheek, to encourage her confidence.

"You heard what papa said the other day about—Mr. Pembroke?" uttering the name with difficulty.

"That he must leave at the end of the year if he does not preach better sermons? Yes, dear, I heard that, and I am very sorry if it grieves you, only we cannot help it, you know."

"Yes, I think *I* can help it, if it be only the sermons," returned Sarah, to my astonishment taking a manuscript out of her pocket, and putting it into my hand with the request that I would read it. Seeing that I looked for an explanation, she continued modestly, "I think it is a better sermon, or at least, that it will please papa better than those Mr. Pembroke usually preaches, and I am sure I can find time to write one such every week, and—"

"And oh, Sarah!" I interrupted, "can you really love a man whom you acknowledge in anything inferior to yourself? *My* lover, if I ever have one, must be one whom I think, and know, and feel from the bottom of my heart, to be infinitely wiser and nobler, and

better than I am. Like Helena's should be my song:—

> It were all one
> That I should love a bright particular star,
> And think to wed it, he is so above me.

"My dear Fanny, if you go off into a rhapsody, it is no use talking to you."

"True, Sarah dear, I beg your pardon, and promise not to rhapsodise any more. So tell me your whole plan. Do you mean to send a sermon to Mr. Pembroke every week, under your own sign manual?"

"No indeed, of course neither he nor anybody must ever know I have anything to do with it. I should not even have told you, only I want you to promise to walk with me once a week to B——, where the manuscript must be posted. I am sure I have disguised the handwriting beyond all possibility of recognition."

This I admitted, but objected that Mr. Pembroke would naturally suppose it was one of his own congregation who thus favoured him, for what could it matter to any of the parishioners of B—— whether he fed his flock on a dry crust, or on the choicest and richest of viands? And, among his own congregation, upon whom could suspicion fall save upon one of the parson's daughters?

But Sarah, wiser than I, reminded me that Mr. Pembroke was personally known to more than one of the families resident at B——, that to know him was to love him (?), and that although it might matter nothing to these individuals what manner of sermons were preached in our village church, it possibly mattered everything that the preacher should remain in their neighbourhood. They had heard of papa's discontent, and the sermons were sent as a means towards the end of preventing his dismissing his curate. Or even should Mr. Pembroke's suspicion rest on one of his own parishioners, had I forgotten Miss Arabella Green? Had she not the pen of a ready writer? and what more likely than that she should employ it in the curate's service? Did she not ask him to dinner, and patronise him, and smile upon him—a hideous smile, truly, but meant as a sign of grace and favour? Had she not sought to gain a husband once by feeding his hungry and clothing his naked, and might she not be seeking to gain one now by writing his sermons? She was old enough to be his mother, I was going to say; true—but did elderly maiden ladies never pay court to young single gentlemen, men young enough to be their sons? It was absurd, but was anything too absurd for Miss Arabella Green? I was obliged to grant all these arguments of Sarah's, to grant that she might succeed in preserving her incognito.

"But," was my next objection, "Mr. Pembroke will never make use of your sermons. Depend upon it, he thinks no small things of his own compositions, his manner of delivering them proclaims it unmistakeably. His form being the happy medium between the Apollo Belvidere and the Farnese Hercules, his style of writing doubtless combines Bishop Butler's powers of reasoning with the eloquence of—whom shall I say?"

"Ah, Fanny, you have always done him injustice. I know papa has told him more than once that he is not satisfied with his sermons. Besides, if he doesn't make use of the first I send, of course I shall not try a second time. But you will read this one, and tell me what you think of it. I should like to make an experiment of my plan for once."

"Very well: but you don't wish me to keep it a secret from Rose? She has gone out to finish a sketch on the moor, and I was just getting ready to join her there, when you came in. She asked me to bring a book to read to her, and if you will allow me, I will take this sermon of yours instead, and when we come in you shall be favoured with our united judgment of its merits."

Having gained the desired permission, I sallied forth, and soon reached the spot where my youngest sister was seated, with her colour-box beside her, intent on the painting she had in hand.

It was now October; the heather had put off its purple robe and donned the sad and sober brown, but it was a lovely day, and the unclouded sun, with its countless lights and shadows, made objects and colours, inanimate and faded in themselves, dance with life and brilliancy. Rose's pencil had been true to nature, and had succeeded in sketching an effective picture. I told her Sarah's project, which surprised her as much as it had done me, and then I proceeded to read the manuscript aloud. We were doubtless partial and incapable critics, for to us it seemed a masterpiece; it was, however, indisputably superior to any effort of Mr. Pembroke's, and we thought even *his* vanity must acknowledge it.

"He is not worthy of her," exclaimed Rose. "If the light-haired brother proves half so stupid, or a quarter so vain, I will have nothing to say to him, though I should see his image reflected in all the crystals in the world, in the very rain-drops as they fall, even though he should profess to love me with an immeasurable love, which last even is sadly wanting in Sarah's case."

"Ah! I had forgotten all about the light-haired brother. Do you mean to say you have discovered he really exists? Mr. Pembroke always appeared so very unwilling to speak of his family. I remember the first day he dined with us, when in answer to papa's question, he said his father was not a clergyman, his confused and hesitating manner gave me the impression that he (the father, I mean) must be a felon, or something of the sort."

"Well, the light-haired brother may be a galley-slave, for anything I know to the contrary. My discovery goes not beyond the bare fact of his existence. One day, however, Mr. Pembroke casually mentioned this brother by name. I ventured to ask if he resembled him, and he replied, some people thought so, but the colour of the eyes and hair was different. Now, our Mr. Pembroke's hair is dark, so it follows the other's must be light."

"No, it may be red."

"In that case, too, I shall have nothing to say to him," replied Rose, laughing; and her sketch being now finished, we returned to the house, and told Sarah we agreed to conceal and abet her proceeding—agreed to be subscribers to the Curate's Aid Society.

The following Friday, Rose and she walked

together to B——, and with the manuscript was posted a note, informing Mr. Pembroke that if he condescended to make use of *this*, the writer guaranteed to supply him with a new one every week, so long as he continued curate of ——. The MSS. would be all original, and the strictest secrecy observed.

Full of curiosity, we entered church the next Sunday morning. Would Mr. Pembroke avail himself of the anonymously sent manuscript? The prayers seemed twice as long as usual, and the second hymn had six verses, long measure. Mr. Pembroke had reissued from the vestry, and ascended the pulpit, full five minutes before it came to an end. We heard him turn over the leaves of his sermon-book, for our pew was just beneath, and by looking up we could easily have discerned whether they bore recognisable features, but we all three felt too conscious to do so. At length the last notes of the hymn died into silence, the congregation seated themselves, the opening collect was pronounced, and the text about to be given out. Breathless we listened. It was Sarah's text! With bended heads we heard each well-remembered following sentence. Would papa make any remark? Mr. Pembroke half obliterated the sense and destroyed the feeling of many a passage by his tasteless screaming; but in spite of this, we thought it must universally be felt that such a sermon had not been heard in —— church since the new curate was inducted. We were not disappointed. It was longer than usual before papa joined us in the garden after the service, and when he did so his words were:—

"I have been congratulating Pembroke on the sermon he gave us to-day. He spoilt it by his unfortunate delivery, else it was one that no young fellow of his age need have been ashamed of. Did not you girls observe a wonderful improvement?"

Rose and I at once answered in the affirmative; but Sarah, conscious and abashed, held her peace. Papa was not satisfied: Sarah had been from childhood his favourite daughter; he was proud of her abilities, and now wanted to have her opinion coincide with his own.

"Didn't you think so, Sarah?" he repeated.

Poor Sarah was obliged to run away to hide her confusion, and I, in explanation, to say she had not been well for some time, and I was afraid she was to-day feeling unusually ill.

"Go, both of you, after her," he ordered, and we obeyed. When we afterwards all three appeared at dinner, he looked anxiously at Sarah. She wore a pale, sea-green dress, and did look really ill.

"I shall send you from home before the winter if you are not better by that time," papa said to her.

In vain she assured him she was quite well: his anxiety was now aroused, and daily she had to meet his look of solicitude, and to answer his inquiry how she felt.

Weeks passed on; the sermons were regularly written and as regularly posted, but not without difficulties. Though Sarah was clever, she required time for her work, and papa unfortunately discovered she sat and studied too much, and that fresh air and exercise were essentials in her case. This made her sit up late at nights writing; she grew paler and more pale, and under the shadow of the sea-green her appearance was ghastly. As the days grew shorter too, the Friday afternoon walks to B—— were not so easily accomplished. It was always quite dark before we reached home, and one evening, when we had had heavy rain as well as darkness to contend with, papa met us at the door, seriously angry, and forbade our staying out so late ever again. There was nothing for it now but to make it a morning instead of an afternoon walk, though this too had its difficulty. If there was one thing about which papa was particular it was punctuality at dinner, which being *on* the table at two o'clock, while breakfast was never *off* it before half-past nine, we had to scud over the moor like steam-engines, and often came in panting and puffing after the manner of those agents of locomotion.

Meanwhile Mr. Pembroke grew in papa's favour; the latter became more and more friendly, and though he declared his curate's powers of conversation did not progress in keeping with his power of writing, he added it was said of a greater man, that he "wrote like an angel, and talked like poor Poll."

One day papa happened unexpectedly to ask Mr. Pembroke to dinner on a Friday, at our usual hour. It was Sarah and I who had taken the walk to B—— that morning; we entered the drawing-room on our return, tired and heated, and found him already there, in company with papa and Rose.

"Been taking one of your long walks I perceive, young ladies. I hear of your going as far as B—— almost every week," was the curate's greeting to us.

Could he have any suspicion of our errand? No; surely the remark betokened the innocence of ignorance rather than the impertinence of knowledge. But papa took up the word.

"In B—— every week—is that true?"

"We have gone there rather often lately," I replied, apologetically. "We have wanted things that John could not attend to for us."

John was a boy sent regularly once a week to the town to make the purchases required for our housekeeping.

"Then I must tell you I will not allow Sarah to take such long walks. But, indeed, she will not have the power of doing so much longer," said papa.

Does papa then imagine Sarah so very ill, was my thought; but he soon proceeded to explain himself.

"I wrote a short time ago to your Aunt Markham, saying I should be happy if she would repeat the invitation I have so often declined, as I thought a little change of air and scene would be beneficial to Sarah. To-day I have received an answer expressive of your aunt's delight. She hopes I will not delay fixing as early a day as possible for Sarah's departure."

Dismay sat on all our countenances. Aunt Markham was papa's only sister, who had been a great beauty in her day, and had made what was

considered a grand marriage for a poor clergyman's daughter, Mr. Markham being an M.P. and a man of large property. She had not only married herself well, but had made still more brilliant matches for her two daughters in their first season, and since this success had been most benevolently anxious to do the same for us, her three nieces. Many a time had papa been implored to part with us to her. He was most selfishly sacrificing our prospects. We were "wasting our sweetness on the desert air." So said Aunt Markham. But the great world and the aunt we had never seen were a terror rather than an attraction for us, and papa too, I believe, thought his sister a vain, worldly woman, and had hitherto been of opinion that his wild moorland flowers would flourish better in their native soil than under her fostering care. Now, however, he seemed suddenly to have changed his mind, and the winter at Brighton and ensuing season in London, with all the splendours which had been suspended over Sarah's head so long, were now to fall upon it, and—so we feared at least—to crush her. How we should miss her too! never having been separated from one another for a single day in all our lives before. What Mr. Pembroke said and did during that day's dinner I have forgotten; after he was gone, and papa had retired to his study, Sarah began to bewail her fate.

"What *shall* I do?" was her exclamation.

"What you are bid, I suppose," returned Rose, with an affectation of gaiety she did not feel. "Papa bids you go to Aunt Markham, and Aunt Markham—let me see—what will she bid you? In the first place, to learn to dance; in the next, to make a bonfire of all your green dresses, look as pretty as you can; and finally to captivate a live lord or rich baronet at the least."

"Oh, but Rose!" said Sarah, dolefully, without the shadow of a smile on her face, "I mean, what shall I do about Mr. Pembroke?"

"And oh, Sarah! I mean London is a big place, and I have no doubt contains thousands of black-haired and handsome-featured individuals, just as like the one you saw in the crystal as Mr. Pembroke is, who will make you forget the existence of the latter in no time."

"You won't understand me," said Sarah, almost crossly this time, "I mean what shall I do about the sermons? I begin now to see my own folly—love it never has been. But if Mr. Pembroke ceases to receive the sermons when I go away, he will find me out, and think, oh!—all sorts of horrid things. I am sure I shall never find time to write them when I am with Aunt Markham, or else I might have sent them by post for you to forward. Oh, Fanny! Oh, Rose! Won't you try to write them when I am away?"

We both, however, positively declined this proposal.

"*Qui amat non laborat*, Sarah," I said, "but in Rose's case and mine the work would be not light but grievous."

I tried, however, to comfort my sister by suggesting that some other way out of the difficulty would probably turn up before she left us. I said probably, though the chance, indeed, seemed small. In a few days more the time of Sarah's departure was fixed. Papa was himself to take her to Brighton the week before Christmas—that was in little more than a fortnight.

We had been all three taking a walk on the moor the day following this decision; the weather was dark and gloomy, and our spirits in unison with it, when on our return we met papa at the garden gate, just bidding Mr. Pembroke good morning. The Curate's calls were not unfrequent, and had seldom any important object: we were therefore rather surprised when papa asked us to guess what it had been to-day.

"To inform me of his intention to leave at Easter," said he, seeing us at a loss: "knowing I was going from home, he thought it better to tell me before I left, as I might, when away, hear of another curate to supply his place. You don't any of you seem to feel much sorrow at my news," he added, scanning our faces, "nor do I myself, either. His sermons have been well enough lately, but he is a vain, conceited fellow, whom I could never bring myself to like."

The news was indeed anything but sorrowful to us. Our first thought was, here was relief for Sarah. The anonymous sermon-writer had only promised assistance so long as Mr. Pembroke should continue in his present curacy. His intention of leaving would remain no secret, and might naturally be supposed speedily to reach the ears of his benefac*tor* or *tress*, as the case might be. That the latter's aid should *at once* be withdrawn might follow as a matter of course. After some discussion, however, we decided it to be advisable that Sarah should send a note to Mr. Pembroke explanatory of these causes and effects, and the following, in the same disguised hand-writing, was accordingly despatched through the B—— post-office:—

"In consequence of information the writer has received, that it is Mr. Pembroke's intention to give up the Curacy of ——, no more sermons will be forwarded."

"I can't understand it," said papa, the next Sunday morning, as we were leaving church; "I can't understand it, unless the fellow has been preaching sermons not his own for the last two months, and to-day has returned again to his original compositions. Can you explain it otherwise?" he finished by inquiring, looking Sarah full in the face.

She was a bad dissembler, and instead of answering began to cough her old nervous cough. I made an attempt at evasion, but it was unsuccessful. Papa was determined on knowing the truth, the whole truth, and nothing but the truth, and he questioned and cross-questioned with all the pertinacity of a crown lawyer. So the story came out. He was not very angry; in fact, I think he was rather proud that a daughter of his could write such clever sermons.

"It is the story of Titania and Bottom over again," he said. "I think, however, we have arrived at the point where the queen discovers the asses' ears, so we will spare her further ridicule." And the subject was never again referred to.

The day of Sarah's departure arrived only too

soon, and papa went with her, and, after something less than a fortnight's absence, he returned alone. We did not see so much of Mr. Pembroke at this time. He had not named to papa his reason for wishing to resign the curacy, and we were in doubt whether it might be he considered the stipend inadequate to his merits, or that the latter were shining under a bushel, in such a wild out-of-the-world place as our village. Suddenly a strange rumour ran like wild-fire over the moor. Mr. Pembroke was going to be married to Miss Arabella Green! It was in everybody's mouth, but we refused to believe it. Mrs. Shipton declared she had all along guessed what would happen; this being, from time immemorial, the observation with which she greeted every piece of news that surprised her ears. The idea of *her* being mistaken! Was he not her lodger, and did she not know everything about him just as if he were her son? Not that he could have been her son, though, she wasn't quite old enough for that. She was, indeed, several years younger than the lady he was going to marry. She remembered Miss Arabella Green a grown-up young lady when she, Mary Podger, was quite a child—years before she had ever seen poor dear departed John Shipton—bless his soul!—to whom she was married when she was only nineteen. And, for her part, she thought the young gentleman was going to throw himself away—such a fine handsome young gentleman as he was. Then, there was Miss Arabella Green's cook's tale to our cook. Of course there was going to be a wedding. As if anybody had a better right to know than she. And she thought her lady, with all her money, might have looked higher than a curate, though, to be sure, he was a handsome young man, and, no doubt, Miss Arabella could buy him a bishopric directly, if she liked. In spite, however, of Mrs. Shipton's tale, and Miss Arabella Green's cook's tale, and the tale of the butcher's wife, who lived just opposite the big, staring, red-faced house, and had seen the Curate go into it I forget how many times a-day—but it was a number that "must mean something:" in spite of these and tales too numerous to mention—our population the preceding Census was 395, and of these every man, woman, and child beyond the age of babyhood, had his or her story to tell about the wedding that was to be: in spite of them all we were still incredulous, only resolving to tease Mr. Pembroke about them the next time we saw him. But before this time came papa received a letter which must be transcribed. It was addressed in an unknown and somewhat illiterate handwriting, bore the postmark of a small town in the west of England, and its contents were as follows:

Reverund Sir,—This coms hopin you will not take it amis seein as how the Feelins of a parint must be sakrid in the heyes of one whose duty it is to inforse the Fifth Comandment from the halter ivry Sunday sir my Name his Pembroke and i ham the Father the unhapy Father of my ungratefull son your curate sir i hope you will Pardon me for trubblin of you with sum Partiklers of my own history my brother and i were hurly left horphans with no fortin beyond the Superor hedication of wich your reverence now as a speciment your Reverence knows as how we receeve not allays the just recompens of our doins in this warld my brother he grows Rich but your humble sarvent he tried the Sea he tried ivry honest callin on land but ivrythink went agin him sir does not the Bibel say sumthink aboot the Stars in there corses a fightin agin a Body well sir sure they did agin your humble sarvent and no Fault of his'n my brother sir he maried a rich leddy and had no childer while my wife of poor but honest parints had Five as fine childern as iver the Sun shined on two on 'em lads and wen my brother seed em he covetted em forby the Comandment says thou shalt not covet so seein as how he wur rich and we had scarce Bread to eat i let him take John George him as is now your Curate to bring up has his own Son and sur he was Brought up to be a fine Gintleman and despise his poor ould Father and Mother that bore him to whom he has niver sent a Penny and who lives now to be a Burden on his brother who is a rispectabel Grocer in this Town and who would niver have let me rite this here letter to you sir if he knowed it but sir he has a Wife and Family of his own to support and hearin as how my son your Curate is goin to Marry a grand Rich lady i thought praps your Reverence might kindly get him to settel a small anuity upon his mother and me to make us Comfortabel and independant in our ould Age sur it is our wish to disgrace Nobody and our Son need not Fear we shall iver put ourselves in the way of his Rich Wife whose Face we hear is not so bony that Folks might long to see It Sir i should not have trubbled your Reverence with this long letter but i can get no anser to those i have writ to my son your Curate axin your Pardon again Sir i am

Your reverence's humble Sarvent to Comand
John William Pembroke.

The effect of this letter was to stir up our indignation against that hard-hearted and unnatural son. Papa suggested it was a case for inquiry, that it might be false altogether, and that the son himself should be heard as well as the father, but Rose and I were ready to stand up for the truth of every syllable in the letter. And we proved right. Later in the day papa called on his curate with the epistle in his hand. Great was the confusion and annoyance of Mr. Pembroke, when he found his humble parentage had become known. He condescended to implore the tale might not be told to Miss Arabella Green, acknowledging the fact of his matrimonal engagement to that lady. He promised that, from the date of his marriage, 100*l.* per annum should be regularly paid to his parents; it had, in fact, been his intention all along, he had told his betrothed of his wish to make a settlement of that sum on a poor distant relative—had he said how *near* was really that relative, it would possibly have led to the destruction of his hopes. Hitherto Mr. Pembroke declared it had been out of his power to do anything for his parents, his uncle having allowed him but just sufficient to support him at the University, and having since his ordination withdrawn the allowance entirely. He repudiated, with indignation, the charge of being without natural affection, and half insinuated the rich marriage he was about to make was an unselfish one for his parents' benefit. This we none of us believed of course, though that money was the attraction there could be no doubt, Miss Arabella being so totally devoid of every other. We gave small credit either to the story of the promise previously obtained from her in behalf of the poor distant relation, else why had the son refused the father the comfort of that

knowledge? That such a promise was, however, afterwards extorted, or at least that the money was regularly paid, is scarcely to be doubted. Papa wrote to old Mr. Pembroke, telling him the result of his own interview with his son, and bidding the old man appeal to him (papa) again, in case he should ever fail to receive the annuity. No appeal ever was made, and so we will trust the old couple lived on to the end of their days in increased comfort, having no longer cause to complain of the stars fighting against them. They must, in the course of nature, be both dead long ago.

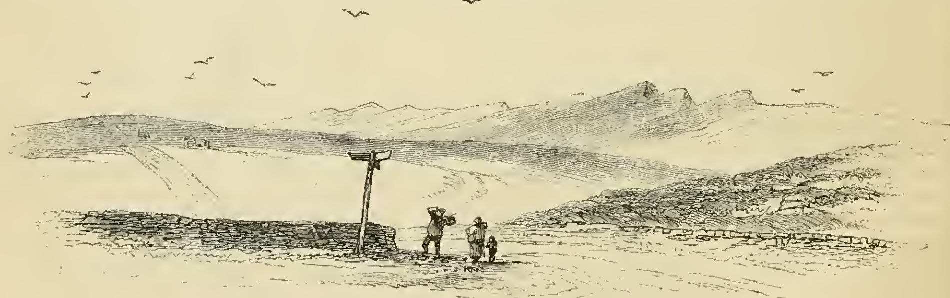
Mr. Pembroke, junior, left us at Easter as agreed. He did not return for his marriage. Possibly the dislike which Miss Green had in these latter days, conceived for papa, made her desire that his should not be the hand to tie the knot; for, about two months later, she went to stay with a friend in the south, from whose house, as we shortly after read in the papers, the wedding took place. Then came the news that Mr. Pembroke had bought the living of——, held at the time by an octogenarian rector, who was obliging enough to die within the year. Mr. and Mrs. Pembroke immediately took possession, and the former, I hear, is still the rector, having daughters by a second wife, likely—when they come out—to be the belles of the county.

My sister Sarah came home to us, after her London season, engaged to be married to the Hon. Augustus Seymour, an agreeable and good-looking young man, with decidedly *light* hair and whiskers, not in the least resembling the picture the crystal of fate presented to her. Mr. Pembroke's brother—"the respectable grocer," being already disposed of—was of course not to be further thought of as a husband for Rose; another was, however, in due time found for her, while of my own fate I shall say nothing. The crystal, it will be remembered, left it a blank.

AN ARTIST'S RAMBLE ALONG THE LINE OF THE PICTS' WALL.

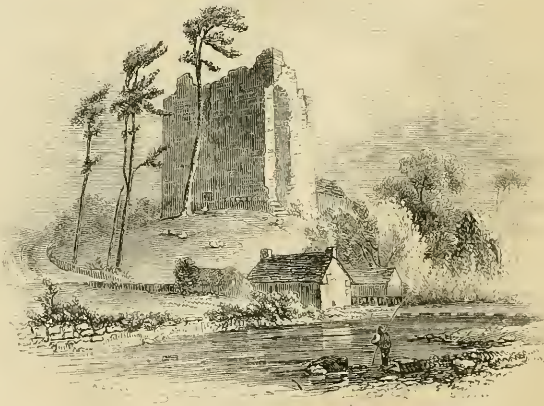
PART IV.

Sampson Erdeswicke, who wrote concerning the wall as early as 1574, says: "The Scotts lyches, or surgeons, do yerely repayr to the sayd Roman wall next to thes (Cær Vurron) to gether sundry herbs for surgery, for that it is thought that the Romaynes there by had planted most nedefull herbes for sundry purposes,



The Nine Nicks of Thirlwall.

Colossal Head.



Thirlwall Castle.

but howsoever it was, these herbes are fownd very wholesome."

Near the wall, and on the eastern declivity of the defile, is a spring, popularly called King Arthur's Well, but, by another tradition, it is understood to have been the well in which King Ecfrid was baptised by the Missionary Paulinus. We took a draught of the water, which is cool and pure.

On the western side of the gap the acclivity is very steep. Hutton says he had to climb it on all-fours. On the summit are traces of a mile castle. We now had before us a series of indented crags, called the Nine Nicks of Thirlwall; along these abrupt eminences the wall appears in great preservation, and, in some places, it presents to the north a height of nearly nine feet, the thickness being nine feet; here we counted twelve courses of facing-stones. Hence the cliffs gradually subside, and a more cultivated region appears as we approached Caervoran—the Roman Magna. The station comprehends an area of four acres and a-half. It stands upon a platform, with a steep declivity on the southern side towards the village of Glenwhelt. This situation appears to have been planned in order to avoid a bog which, had the station been set as usual next to the wall, must have intercepted the vallum. The latter avoids the bog by running close to the wall, which is carried along a ridge of elevated ground. Some fragments only of the north rampart and the fosse on the same side remain. We now descended to our quarters at Glenwhelt, where, in the inn, are preserved a magnificent pair of antlers found in a well at the station.

Here, after a seemly libation, we took leave of W——, and, having rested, strolled by the banks of Typalt Burn to the dark and shattered walls of Thirlwall Castle, whose name is supposed to have been derived from the Scots having broken through the neighbouring barrier in one of their aggressions on the southrons.

The walls of the castle are of the great thickness of nine feet, and the facings are composed of stones taken from the Roman wall. I may here remark that for ages the wall appears to have been appropriated for every kind of erection built near it. The materials for farmhouses, cottages, and dry stone dykes, have been so abundantly quarried from it, that the only marvel is that any part of it should remain; but the larger vestiges appear chiefly in craggy and barren solitudes, the abode only of the curlew and the hill-fox.

After the dispatch, on the following morning, of such a breakfast as only pedestrians enjoy, we set forth for Gilsland, our next quarters, stopping as we sallied forth to pay our respects to the colossal head, which stands in all its grotesque ugliness upon the wall in front of the inn, its ludicrous effect being enhanced by the top of a quern, which some pious hand has clapped on it, after the manner of a Scot's bonnet. Between the waters of the Typalt and the Irthing, the wall traverses a flat and exposed surface, and here the vallum has closely accompanied it, but of the wall within this space there is no superficial appearance till arriving at the small village of Wallend, about half a mile no. Here the two lines of defence change their relative positions; the wall, pursuing a lower level, is entirely commanded by the earthworks of the vallum, until the river Irthing is attained.

Arriving at the Shaw's hotel we only stopped to bespeak our dormitories, and take needful refreshments, which, being accomplished to our full satisfaction, we proceeded on our way, and, crossing the Poltross Burn, stood on Cumbrian ground. Here, after having climbed the steep precipice on the opposite side of the burn, we again fell in with the wall and vallum, and the vestiges of a mile castle, and, after an escape from an angry bull, approached Burdoswald, a name which is accounted for by the tradition that Oswald, King of Northumbria, had a hunting-seat here, and was here seized while alone and fishing in the waters of the Irthing by a band of northern freebooters.

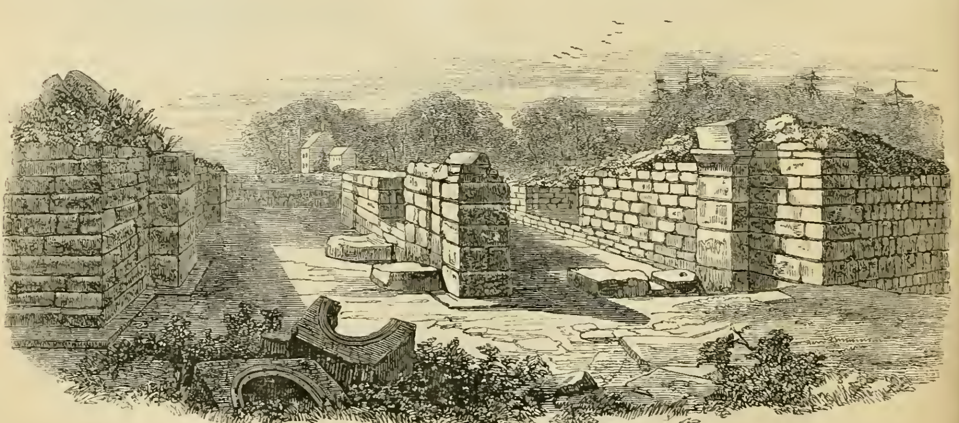
Burdoswald—the Roman Amboglanna—is the twelfth station on the wall. It comprehends an area of between five and six acres. Having been ably excavated in 1850 by Mr. H. Norman, the proprietor of the camp, and Mr. Potter, its parts are clearly defined, and it is justly considered one of the most perfect stations along the whole line of the wall. A greater number of inscribed stones have been found here than in any other station on this line—and from these it appears, according to Horsley (Brit. Rom. 257) that about the middle of the third century, the *Cohors Prima Eliana Dacorum* was here stationed. The derivation of the name Amboglanna has been the subject of different conjectures, the most likely of which appears to be that derived from the Latin word *ambo*, and the British *glan*, the brink or bank of a river, which agrees exactly with the situation of the camp, standing as it does upon a point of land, with the steep banks of the Irthing on either hand of it. Beginning with the west gate, *Porta Principalis Sinistra*, the sill stones are in perfect preservation, with two grooves, which appear to have been worn by the wheels of carriages. When this gateway was opened out, a rough wall presented itself, which from the inferiority of its masonry, had evidently been the work of ruder hands than those employed upon the wall of the station, making it evident that the gateway had been built up long after the Roman occupation, and suggesting the idea that the camp may have been appropriated as a stronghold in the subsequent days of border warfare. This wall has been removed, and the gate, the opening of which between the pillars is eleven feet two inches, clearly exposed. The present height of the highest pillar is four feet eleven inches. To the south-east, at a distance of a hundred and thirty-six paces from the west gate, is the east gate—*Porta Principalis Dextra*. Between these gates would be the *Via Principalis*, which," says Mr. Potter, "in some camps, is one hundred feet wide. The length from north to south of the camp at Burdoswald is about one-third greater than the breadth from east to west, which, according to Vegetius, who lived in the reign of the Emperor Valentinian, A.D. 385, was the most approved form."

The eastern gateway is composed of much larger masonry than the west, although the opening between the pillars is less by thirteen inches. This gateway was likewise found to have been built up. A little distance to the south-east of this gate, the Roman road is clearly discernible. Midway, in the south rampart, is the south, or Decuman gateway. Adjoining the gate is a guard-room, ten feet four inches in length, eight feet broad, and standing at a height of eight feet.

This chamber is fitted with a rude oven. Near the guard-room are the remains of a kiln for drying grain, apparently of Roman construction. The floor is flagged, and measures four feet four inches by three feet eight inches. Near the gate lie a number of wedge-shaped stones, which no doubt have formed the arched tops of the gateways. A fourth gateway has been opened out about fifty-five yards north of the east gateway. It is in fine preservation, having guard-rooms on either side, that on the left of entrance measuring ten feet seven inches by ten feet, and that on the right nine feet by ten. The openings of the double gateway measure each ten feet. The north pier of this gateway remains complete, including the impost and first stone of the arch, and presents the most perfect specimen of masonry along the whole length of the wall. The two first courses of stones

Course of the Wall at Caervoran, looking over the Moss.

measure one foot four inches square, the masonry being finely jointed, and the impost strikingly bold and massive. This pier is eight feet and a half in height. Within the gateway lie massive semicircular door-heads, which have belonged to the entrances to the guard-houses. About fifty feet of the wall of the station have been laid open to the north, and twelve courses of fine masonry, in perfect preservation, exposed. This gate had communicated with the suburbs, the lines of which are apparent in the undulations of the soil. From the discovery of floors in the area of the station, at a height of four feet above the Roman level, it is presumed that this camp had been occupied after the departure of the Romans, probably at a time when the gateways were built up for further security. The commanding situation of Burdoswald would make it a desirable point of vantage to some Saxon or Danish chieftain. A little to the north-east of Burdoswald, near a tumulus,



North-east Gateway of the Station of Amboglanna.

some masonry was a while since removed to supply materials for a modern erection. This was called Haro's or Harold's Castle.

Within the area of the station, a room measuring ten feet by nine feet six inches, has been uncovered; the walls appear to have been coated with a red stucco. It was found to communicate with another of ten feet by nine feet six inches, in which is a hypocaust, and behind the hypocaust there is another chamber, measuring nine feet eight inches by nine feet six inches. These apartments, it is supposed, have been used as baths. While excavating one of these apartments a small headless statue seated in a raised chair was found, measuring thirty-four inches. The missing head is, I believe, in the museum at Newcastle. It were well if head and trunk could be reunited.

J. W. Archer.

LILIAN'S PERPLEXITIES.

A TALE IN TWELVE CHAPTERS; BY A. W. DUBOURG.

CHAPTER I. WHAT THE IDOL WAS MADE OF.

In a boat on Brienz lake—then a lake of silver by reason of a large August moon—the cool evening of a hot day, flakes of silver sliding from the oars, rowlock noise and ripple, silver light alternating with deep black shade—in this boat on Brienz lake sat Charles Westby, Esquire, Barrister-at-law, and in the line of his eyes the sweetest half-length of a girlish figure, perfect outline dark against the molten silver of the lake.

Now, Charles Westby was intently considering what ought to be said and what ought not to be said in a certain matter, to wit, a Chancery suit in which he held a brief. This was an erroneous employment of time: firstly, because the subject on hand is the subject best worth thinking about, and the present occasion formed no exception to the rule; secondly, because an eminent member of the faculty had absorbed a guinea, shaken his head, and stated authoritatively—

"Mr. Westby, if you don't give up all business thoughts for two months, at least, I won't answer for the consequences."

"And your prescription?" asked Mr. Westby, desiring something tangible in return for the absorbed guinea.

"Here it is, sir; it is so simple that you won't require the intervention of a chemist."

The prescription consisted of three English words—"Go to Switzerland."

Mr. Westby did go to Switzerland, but the sanative property of the prescription did not lie in its letters. He coloured everything with equity that he saw in his route—Paris architecture, Louvre pictures, Strasbourg cathedral, the pleasant Vosges mountain range seen from the second-class on the Strasbourg and Basle Railway, the swift green Rhine shooting beneath the balcony of the "Trois Rois" at Basle, and the sunrise on the Rigi.

"And pray, sir, what description of colour is equity?"

I can't tell you, reader; it is impossible to describe colour. Can you tell me what red is like, or green, or blue?—You can't, and I can't tell you the colour of equity. I state a fact—Mr. Westby coloured everything with equity, and he found that the prescription was quite ineffective.

But there must be no light scorn thrown at Mr. Westby—a man cannot cast off the motive thoughts of life as a garment; they are knit in with the blood like the burning shirt of Hercules. Equity represented in his mind two great ideas—reparation and ambition.

Reparation—there was a long score of youthful idleness to be paid off. A heavy sum of money, ill afforded, had been spent almost uselessly on his education. From six years old to nineteen, the same thing had been said sorrowfully by his father—a good, kind Wiltshire clergyman with a narrow living—"Ah, Charles, if you only had the will you could learn anything." And his mother had said sadly, yet with hope, "I am sure Charles will apply one day."

That day of grace was slow in coming, and all but a mother's love would have grown sceptical. Anything but learning for Charles Westby—an idle, bird-nesting life in his early days—an idle, prankish life at school—a valuable exhibition, which would have lightened the burden of his college expenses, lost for want of application. Yet his good father would have him go to college, the household expenses of the rectory were cheerfully narrowed to support the son of the family, in the hope that repentance and application would be the results of home sacrifice. But the results were boating, not as a healthy recreation, but as an engrossing object, and profitless friends, and debts, their natural sequence.

The day of repentance came at last. It was a great question which was the best oar, Westby, of ——, or Jones, of ——. To decide the fact, Jones challenged Westby to a sculling match. Westby accepted the challenge. He ought to have refused. A sadly desponding letter had arrived from the rectory, deprecating his college life: he was touched by his father's indignant words, and his mother's gentle but reproachful postscript. Ought he to refuse the challenge? The "inner voice" said he ought, his friends said he ought not. Well, then, for the last time he would go into training, row the race, give up the water for ever, and become a reading man—his father and mother should have no more cause for grief on his account—this he firmly resolved on.

Both men were in splendid condition, doing their work capitally; the betting was even, there was nothing to choose between the two competitors, their friends backed them heavily, and the rowing men generally were deeply interested.

The race day arrived, the still moment of the start. They're off!—stroke for stroke, both boats as nearly even as possible: after a time Westby takes the lead slightly, but Jones puts on a spurt and goes ahead. Westby, rowing strong and steady, gradually regains the length Jones has made, and the boats are even again. Jones tries another spurt—a tremendous one—and goes a length and-a-half ahead; but Westby regains the distance in less time than before. It is evidently getting all up with Jones; his friends cheer him from the banks, but won't take the bets of Westby's party at two to one on their man.

Row on, Charles Westby, strong and steady: it is the last race you will ever row—you don't know it, but you are pulling for far more than a triumph over Jones and the honour of your college; every moment saved in the time of the race, you will prize beyond gold.

"He's won! Bravo, Westby! Fifty pounds in my pocket. Hurrah! That's Fred Temple speaking to him, his great chum—why he's fainted! They are carrying him ashore. Gad! the pace was killing."

It was not the pace that knocked up Westby, but the words of Frederick Temple, who bent down the moment the boat touched the shore, and whispered in his ear—his two ears tingling with the sound of triumph—the men who had won money on him hurrying with loud shouts to grasp his hands.

"Charles," whispered Temple, "they've sent to say your father is very ill,—it's a bad business I fear."

Then the "inner voice" which had spoken when that last letter arrived from home spoke out again, loudly this time, so loudly that it hushed the noise of victory, and the sculls which he yet held fell away from his hands, and he sank back into the arms of those who had come to greet him, rushing knee-deep into the water in their eagerness and joy.

They got him to with brandy, covered him with boating coats and a great coat,—there was no time to change the jersey and flannel trousers, not a moment to lose, the train would start in a few minutes, and failing that train there would be a delay of many hours.

The messenger from home had luckily fallen in with Temple, who did not accompany his friend to the starting-place. It was too late to stop the race, indeed the race was the quickest mode, as Temple wisely determined, of getting Westby back again.

* * * * *

They were waiting for Westby at the Rectory, very anxiously—the Rector lay in his bed, propped up with pillows, his wife and daughter by his bedside.

The doctor had said there was no hope—why only yesterday it had been all life and health and good spirits. No hope! hard words to realise by those anxious watchers at the bedside, with every happy incident of yesterday vividly fresh in their minds.

The Rector certainly possessed his senses, but they were absorbed in some great thought—for even when his wife or daughter spoke immediately in his ear he gently motioned them away. A neighbouring clergyman, who had been hastily called in, ceased not to talk of religious matters in an earnest strain,—praying and exhorting—his voice was quite loud at times, rising with the subject; and the sorrow of wife and daughter, notwithstanding all their efforts, would break restraint into loud sobs. The Rector heeded none

of this, but when there was a distant rumble of wheels, he would start and faintly point to the window. To the window went mother and daughter, and they gazed on the bend of the white dusty road blurred to their vision by their tearful eyes, praying that it might be the fly bringing Charles from the railway—but time after time, amid clouds of dust, came tilted carts with market folks from Salisbury, or brisk driven farmers' gigs.

The clergyman was much distressed at the dying man's state of mind. He led Mrs. Westby aside, and whispered something of evident importance in her ear, and in reply to her hesitation he urged her—

"Ask him if he is now prepared,—we must lose no precious time."

Mrs. Westby did as she was bidden, the Rector slightly inclined his head, and murmured the word "Charles."

Mrs. Westby told the clergyman hat her husband only waited his son's arrival.

"This delay is very sad," said the clergyman, "his time is so short."

A message was brought to the room that some one who had wronged the Rector had sent to crave his forgiveness.

"Ay," said the clergyman, "at a period like this it is very meet that we should forgive all wrongs done to us. Pray explain it to him—Farmer Jones asks pardon for his conduct at the Church-rate meeting."

Mrs. Westby went to the bedside and repeated Farmer Jones's message.

"Mary," murmured the dying man. She took his hand in hers. "Mary," he repeated, and his daughter came close beside him. Their hands were clasped together. The Rector made an effort to raise himself—there was a glow of joy in his countenance, exultation in his weak voice.

"Mary, *he will* repent—I know it—*know* it—God has heard my prayer—I'm very happy—my boy—my boy."

The hands held by his wife and child gradually lost their grasp. And then an hour's insensibility, and the end.

* * * * *

When Charles Westby reached home he saw by the face of the servant that it was all over. "*Missus* is with Miss Westby in her room, sir," said the girl. He would not let them be disturbed, but went directly to his father's room.

No affectionate greeting, no good counsel in kindly words, no more friendly admonition—a sweet smile on a placid face, and silence—that was all. Father and son were alone for a long time.

The clergyman, full of zeal, tried to comfort the women. He read some short passages from the Psalms and New Testament, very aptly chosen, and he wisely refrained from adding any words of his own, having ascertained by experience that at such periods God's own consolation was far better than any poor comfort which he could afford.

And then he thought it was a good time to speak to the young man. "He has been very thoughtless hitherto, far from correct in his conduct; I may, by God's blessing, make some impression on him."

So he joined himself to Charles Westby, who was pacing the gravel walk by the house.

It was drawing on to night—a flush of sunset, dying into palest tinge of green, lingered beyond the dark outline of distant fir plantation which belted the downs to the west—darkness was slowly rising from the east and lighting the stars.

Charles Westby thanked the clergyman for his kind interest, but particularly desired to be alone; and consequently the clergyman, who was stored with pious admonitions, had to retire, not a little chagrined at the loss of so golden an opportunity of converting a soul. His regrets were needless—the turning point of life is from within. You may talk very eloquently, very wisely, you may press your words home—but repentance is deeper than conviction, and it is not until the man's own conscience speaks to his soul that the hour of repentance comes. "*I* will arise and go to my Father." Charles Westby's repentance had been already consummated in that hour's communion with the dead.

He wished to be alone—he could not share his feelings with either mother or sister; they had sorrow—he had sorrow and remorse. The last was very stinging: "You have wasted your father's slender substance,—your mother and sister will suffer for this; they won't reproach you, but silence will be worse than words." He needed some anodyne to sooth the pangs he suffered. There was one—reparation. Ah, how he longed to be at work, even at that moment, repairing the past; it was a relief to revolve plans for the future. His college life had ended—no more funds to support him there; something in London. What? And he paced up and down the gravel-path, many a time, with "what?" unsolved.

In the intensity of these thoughts his past life seemed to fade years back—his college hopes and plans — even the aquatic triumph, but a few hours old, and he was still dressed in his rowing-garb, had lost the excitement of recent action. There was great lassitude in his frame, the result of that intense physical effort; yet with sorrow and remorse close at his heart sleep was impossible; and, worn as he was, that pacing to and fro, in the cool night air, was a relief.

* * * * *

Charles Westby went to London—a few lines will tell the struggle of eight years—he got hard work and little payment, as a great favour, in a solicitor's office; he ate his "terms," supported himself, and sent something home out of his pittance. Then he gave up the solicitor's office and obtained some parliamentary reporting in the evening, which enabled him to pursue his law-reading by day.

It was a vast change at first from physical to mental effort — the muscles which had been developed by the use of the oar had to be attenuated by the use of the pen. But he had put his hand to the plough—there was no looking back on old habits and pleasures. Happily no temptation to do so, because remorse stood watch

and ward over the past. At last came the reward of this hard struggle; labour was no longer a painful effort. His father's prediction was realised —he had acquired the *will* to learn, the key to his talent, and he had the intense gratification of finding that slowly but very surely he was attaining a sound knowledge of his profession.

Gradually the great object of his life grew to be law, not in the "warp" only, traversed with threads of lighter thought, but the "woof" was law as well.

Thus, hours of relaxation would be spent in following the argument in this and that case: he would form his own judgment, waiting anxiously to find whether it concurred with the judgment of the court. Sometimes he and the judge were unanimous; sometimes when they differed, there was an appeal to a higher tribunal, and once or twice, to his intense exultation, the joy of the successful suitor was scarcely greater; the judge's judgment was reversed, and his view of the case affirmed.

But why did not business come? True, he had no connection, but he did know some few lawyers —they might have discovered his talent, that firm at least in whose office he was when he first came to town—yet those who knew him best sent him least business, and, since his "call," they all seemed more or less to keep out of his way. Then he would be beset with heavy misgivings; perhaps, after all, he might be deceiving himself as to his power and talent; perhaps that hope—faith in future eminence—was a delusive dream; perhaps, notwithstanding the hard labour he had endured, mediocrity was to be his destiny.

Hard work by night, hard work by day, bent head, depressing doubt and fear, the unceasing wear of a gritty thought—law; it was too much, he had strange sensations in the head, so at last he was forced to consult a physician, who, with scarcely a question, read the case in his patient's countenance, and gave the Switzerland prescription.

* * * * *

Hot walking and hard to the top of the Brünig Pass. Well, the view was fine certainly, Charles Westby was forced to admit that, but it had been a deuce of a pull up hill, and, after all, this Switzerland did not seem to do him much good: he could not get rid of that feeling in his head, notwithstanding he had entirely given up reading as the Doctor ordered, so very likely it was not the fault of the books. Now, if he had been at chambers this vacation time, some business might, in the absence of other men, have been driven into his hands; besides all this, travelling cost a mint of money,—he could not afford pleasure yet,—in a few years perhaps, when he had made a name; directly he got to Interlachen he would turn back by Berne to Strasbourg, and home. Such thoughts as these presented themselves as he was descending into the Hasli valley with the giants of the Bernese range before his eyes.

A party on horseback consisting of two ladies and a gentleman with guides, porters, &c., had started in the morning rather earlier than Westby, and had kept about the same distance a-head of him throughout the day. About half way in the descent to Brienz he saw them stop suddenly, perhaps to enjoy the view, or rest; in a short time he came up with them. The whole party had dismounted; the gentleman, a middle-aged man, was sitting on the ground, evidently in pain, the two ladies knelt beside him; the guide and porters, a little apart, were holding a noisy consultation. The eldest lady addressed Westby—her husband had met with a terrible accident—her daughter, who was riding in front, had pulled up her horse rather suddenly; the horse had kicked out and struck her husband, who was riding close behind, severely below the knee; they feared the leg was broken—how should they ever be able to get to Brienz?

"I can't understand these guides," said the young lady, who was sadly agitated; "their French is full of German words. This delay is terrible for poor papa."

Both ladies prayed anxiously of Westby not to leave them. Such a request was, of course, needless, and his hearty promise of all assistance that lay in his power, seemed a staff of comfort. It was evidently impossible for the poor gentleman to ride again on horseback, and for the porters to have carried him over such rough ground, without proper supports, would have added intolerably to the pain which arose from the slightest movement of the leg.

Westby proposed to hurry down to Brienz, and make the best arrangement that he could for a *chaise-à-porteurs.* They gratefully accepted his offer.

In about two hours Westby returned with the *chaise-à-porteurs* and the best appliances he could procure for supporting the leg. There was, unfortunately, no doctor resident at Brienz. Westby's aid was invaluable; he saw with a quick eye what to do, and he had strength of arm to do it with great gentleness.

On inquiring at Brienz, Westby had found that the best medical advice of the district was to be obtained at Interlachen, and that it would be advisable, if the state of the accident allowed it, to proceed thither at once by water. Accordingly, when they arrived at Brienz, it was agreed, as the sufferer had borne the *chaise-à-porteurs* motion tolerably well, to go on directly to Interlachen; and a boat having been by the care of Westby carefully fitted up with pillows, they embarked on the lake.

How deeply they thanked him! The gentleman with painful effort, the elder lady from the depths of the heart, and that young girl—Ah! it was worth conferring an obligation to gain such heartfelt thanks—to see the expression in that young charming face, flushed with very intensity of feeling, and those blue eyes, looking full into his, with their earnest gaze of gratitude.

Well, that girl had a charming face, and if love had been the motive, deepest love could not have lent a more beautiful expression than the one he had witnessed; but fair faces were not his business yet; hard duty, money to add to his mother's and sister's pittance, that was his present business; so, sitting in that boat, the excitement of action being over, his thoughts flowed into their old channel, and Equity sat beside him, as the rowers

—men and women—rowed down the silver water, timing the oars' stroke with rough lake-song.

They got safely to Interlachen. The sufferer was conveyed to the Hotel des Alpes. Herr Jacob, the manager, was very kind and assiduous in his attentions; the doctor presently reported, to the infinite relief of the ladies, that the leg was not broken, but the bruise was very severe, and in addition the ankle was severely sprained by the fall from the horse after the kick. The case would require some weeks' rest.

CHAPTER II. THE IDOL ON A PEDESTAL.

The morning after the accident, Westby was seated at breakfast in the *salle à-manger* of the Hotel des Alpes; he had determined, if his services were not likely to be of further use to the ladies, to start for Berne in the course of the day.

"Why, bless me, that's Westby!" exclaimed a voice near him.

Westby looked up; he did not for the moment remember the face, the light tawny beard and moustache.

"Fred Temple, isn't it?" he exclaimed the next instant.

"Yes, old boy!" was the reply, coupled with a hearty grasp of the hand.

They were delighted to meet again, school-fellows and college friends—a full eight years since they had met last. They ought to have written, it is true; each blamed himself for not doing so, but neither was a letter-writing man.

"I know you cut college after I left, and went into the army," said Westby, "what have you been doing since?"

"Oh, shifting about here and there—England and Ireland and India. And you?"

"I've stuck to London and law."

"Dry work, eh?"

"At first, but I like it now."

"'Gad! the fellow who would hardly touch a book at school or college. What a change!"

"I am changed," replied Westby; "two minutes' sight of you tells me that. I can see your manhood is the sequence of your boyhood—light heart and dash; that was my boyhood, too. I've done a mass of head-work since then, nothing but that, and become leaden-spirited. Yours is the old face, fresh and beaming, a little burnt, perhaps—India, I suppose. I know my face is getting like parchment."

"Pooh! a trifle pale—interesting, the women would say."

"Pale! that's the incipient stage; the parchment yellow 's sure to follow."

"Westby, old boy! I'm so glad we've met. The whole lot of us are here—Fairy, too, you recollect, my sister, who was staying at my uncle's when you were on a visit there."

"What, my fairy sweetheart, little Lilian?"

"Little! It must be ten years ago, recollect. You would not know her now. I only joined our party this morning, and there's the governor tied by the leg—deuced unlucky, poor man!—coming over the Brünig yesterday——"

"Could that have been Lilian?" exclaimed Westby.

"What! were you the fellow who got them out of the scrape? 'Gad! the women can't say enough about you."

"I've found you at last, Fred," said a voice behind him.

"Here's Lilian!" exclaimed Temple, turning round. "Little Lilian! Don't you know him, Lilian?"

"Yesterday——"

"Years before yesterday!" interrupted her brother. "Uncle Everard's!"

"What, Karlo Magno!" she exclaimed, with surprise.

"Yes, yes; Karlo Magno," replied Westby laughing.

"I ought to say Mr. Charles Westby," replied Lilian, blushing.

"No, no!" said Temple; "call him Karlo Magno—your old name for him when they were teaching you German history."

Westby inquired for Mr. Temple, who he found had passed a very fair night, the doctor speaking most favourably of his condition.

"How oddly things do come about," said Temple. "Do you recollect that old plan of yours, Lilian—travelling on the Continent with Karlo Magno and myself—no governess or lessons?"

"That was a child's fancy, Fred."

"It's come true, nevertheless."

"I think of returning to-day," said Westby.

"Nonsense, man! What for?"

"Oh! they said I had been over-working—perhaps I have—that I looked ill—that I'd better travel for awhile; but it don't do any good."

"Give it time! your head is chockful of stuffy thoughts, I'll bet. Half-an-hour's thinking gives me a headache."

"I'm sure you never tried the effect of that length of thought, Fred," said Lilian, laughing.

"Then I act all the quicker, you rogue. Come now, Westby, we'll engage to clear the cobwebs out of your head in no time. Won't we, Lilian?"

"That we will! Recollect, Mr. Westby, the old plan was to have nothing to think about—pleasure all day."

"Nothing to think about!" exclaimed Westby. "Query, would a mental vacuum be pleasure?"

"I mean, not to think about troublesome, bothering things," replied Lilian.

Westby consented to remain at Interlachen for a few days. In truth, he had not the heart to say no. That old visit of his at Mr. Everard's, in companionship with Temple and his sister, had been one of the happiest bits of his life: a country-house life, with all the means of active amusement and sport in which he delighted; the fun of half-spoilt Lilian's evasion of the school-room, and participation in the pursuits of her brother and himself; daring rider of a spirited, mealy-nosed pony; skilful coxswain of their boat on the pleasant stream; not one atom a romp; wholly a fairy—lightest strength and delicate grace in every action; and her childish talk passing strange with the quaintest conceptions of life.

"Well, Mr. Westby, we have made you enlist in the health service," said Lilian, with a smile.

"Ha, ha! a recruit!" exclaimed Temple, laughing. "Come, sir, and go through your drill——"

"That's right, Fred! begin at once; give him a long march to-day."

"Never fear, I'll fill his mind with mountain air."

"And you, fair captain, do you march with us?" inquired Westby.

"Not to-day; I'm on—what is it, Fred?"

"Garrison duty."

"Yes, yes; and, besides, I've got dear papa to look after. Now, then, soldiers, shoulder arms!—alpenstocks, I mean!—march!"

And off they went. Lilian to her father's bedside, to tell her parents that their friend of yesterday was her brother's oldest friend, and her playmate ever so many years ago when she was quite a wee child.

So Westby was fated to have a real holiday after all—a holiday life with two people whose lives had been a perpetual holiday, amusement the end of their existence. Frederick Temple's amusements were of the physical order mainly—fox-hunting in England, tiger-shooting, pig-sticking, and the like in India; and Lilian was true to her old love of active pursuits, but with mind beyond her blue eyes which had sought amusement in deeper matters; yet her intellect was hidden from ordinary sight, few of the many partners of a first season suspected it in her enthusiastic love of Whitenose, her horse, or the *valse-à-deux-temps*—herself a paragon of dancers.

The two friends walked upwards behind Interlachen, holding a gasping-breath conversation on old times; the mountain breeze smote their faces with pleasant coolness as they turned for a moment's rest, or sight of the valley beneath.

Temple was such an inspiriting companion; care, the vampire, had never fastened on his spirits, and there they were full and overflowing as a boy's. His conversation was a delightful novelty to Westby, presenting such easy happy views of life; events had fallen on Temple like feathers to be blown about at pleasure, not leaden weights to be sternly endured. Westby had come abroad to try for a while to forget the past, Temple recurred to it with intense pleasure—such stories he told; muscular power spent in great adventures, riding and shooting feats, big bags of Indian game, tigers and leopards, boars and antelopes, and all manner of birds; these things spoken of in such hearty enthusiastic words that the old nature of Westby, buried beneath many legal tomes antagonistic to the natural man, was aroused, and old boyish dreams of active, dare-devil life, soldier, sailor, emigrant, flitted through his brain, as he strode along breathless at Temple's side, Temple in better walking trim than himself, listening with eager ears to this Indian talk.

"I have given the man a good breather," said Temple to his sister. "How do you feel after it, Westby?"

"Why, I *think*——"

"Think! that's just what you are not to do, Karlo Magno!" exclaimed Lilian.

"I am better, then."

"The walk, you see."

"Yes, and your brother's conversation."

"Just what I feel; whenever I'm tired, I make Fred talk, he always enlivens me. I'm tired now."

"How so, Lilian?"

"I've been amusing papa all day, that is, writing business letters for him—money, the everlasting subject. I hate it."

"Honey's pleasant! don't blame the bees, my pet."

"I'm not a drone, Fred! I hate to be idle, as much as you do."

"Ah! but our activity don't pay."

"Never mind, I kill time, and you kill tigers."

"Confound it! Russians would have been more profitable. I missed the Crimea, Westby."

"You would go to India, Fred."

"I'd always wanted to see India—I exchanged, Westby. A year or so after I got out, the Russian row begins. Everybody said we should be sent to the Crimea; I thought so, too; month after month we sweltered under the punkas, but the orders never came. I grew sick of the whole Indian business, hunting and all; so when the French shut up for want of money and made us make peace, I got a year's leave and came home."

"Poor boy! I dare say there will be a row in India some day."

"Nonsense, Lilian! who with? Who is there to fight us, and our big native army? We shall be ordered home in another year, that's one comfort."

"It will be a comfort to me," said Lilian. "I shall miss you so, Fred; there's nobody to ride or walk with."

"Well, I dare say the next London season will provide a companion. For instance, that tall, elegant, handsome——"

"Nonsense, Fred! it's a great shame—I did not care one atom—I declare it's true, Mr. Westby!—I won't be laughed at; why, Whitenose has got more intellect!"

"Ride with your father, then."

"Stupid Fred! when you know papa's pony, and the affinity it has for money matters."

"For money matters!" exclaimed Westby.

"Yes, it's very odd; there are several animals of the same kind, they always join company in Rotten Row, and listen to their riders' talk of the city events of the day—this equestrian finance fidgets Whitenose dreadfully."

"There, never mind stuffy London!" interrupted her brother, "I had enough of it last season. Let's think what we ought to do while we are here."

All three plunged into Murray and Keller. Lilian enthusiastically proposing the most tremendous mountain feats which were gradually laughed into possible performances. Day after day they went forth to see the grand sight of that mountain land. It did wonders for Westby, this happy companionship; the equity colour was thereby clean cast out of his eyes; there was no resisting the enthusiasm of Lilian, with her fresh new thoughts gathered off the riven granite masses, and their snowy summits, bossy white at noon-day against the deep blue sky, or sun-flushed at dawn and eventide, rolling their dead white ice-waves into the gloomy valleys beneath. And

those same mountain-tops, and rough flanks, and all that eternal snow, were things for climbing and scrambling in the estimation of Frederick Temple, with great obstacles to be overcome by heart and limb.

Such scenes to see ! only a few hours from hard-worked London, by a path of pleasant country, French or German land, to this holiday ground. Tired heads wanting a change of thought, all-engrossing, deep-seated thought, emulations, ambitions, against which a level country, however pleasant, would be powerless ; but those granite giants are irresistible, they will fill your head with their immensity—your atom self and that vast mountain, two miles or more distant ; no intervening objects to break the intense power of size, and yet it seems you might almost fling a stone from your standing point on that Wengern Alp to the Jungfrau opposite ; ay, and climb that rough mountain surface, deftly picking your way by those clearly defined granite fragments, broken into possible steps, down which snow-flakes are falling from the upper snow. Thunder in the clear summer sky ! the snow-flakes are avalanches which would snap down forests in their force, and the possible steps are precipices which no man has scaled or will scale to the end of time. The path trodden on those waves of ice, which for ever roll on and on, by years, not moments, with short slides to sure death in those insidious *crevasses* with their green mysterious light fading into dark depths—those steep, precipitous rocks, bleak and cheerless against the blue sky, girdling the valley with their cold shade hours after sunrise, yet at a further point of view their summits unexpectedly crowned with upland pasture, vividly green in the sunlight, dotted in that upper distance with toy-sized châlets, and goat-herds, and mice-sized goats —such scenes as these are to be treasured in the memory, and brought home, and used in lieu of the painted or papered monotony of dull chamber walls, as a diversion for tired heads raised for a moment from weary print or scribbled brief, bringing up refreshing recollections of physical activity and vigour in contrast with present mental effort.

Westby lost his headache in the clear mountain air, and he felt again with delight the sensation of weariness from hard exercise, not rankling thought, followed with troubled slumber, but fine deep sleep, and clear head, and elastic step on the morrow.

So finding his health improve, his thoughts set homewards ; but letters came from home praying him to prolong his tour—"it had already done him so much good, why not remain till his health was quite restored ?" The Temples, brother and sister, said the same thing, and they were so resolute, too, they fought his reasons for returning from point to point, and thus it was that he was led to speak frankly of his affairs, and of his eight years' struggle after leaving college, speaking as a man would speak to his brother and sister. Frederick Temple listened with many expressions of wonder at what he had accomplished, and Lilian listened silently, but very attentively ; and if the conversation changed, she would bring it back with a skilful turn, and often in their walks she would with great delicacy render it the subject of their talk.

"Nothing to think about, Lilian, except thoughts that lightly come and go ? You are thinking deeply about this man's life ; it does interest you, that hard fight of his with the world, that love of his for the two at home, a love not loudly spoken, very indirectly indicated indeed, but plainly visible to your quick insight. Well, heroism in any form is a pleasant tale, and though young, you have been already somewhat tired with the smooth amenities of existence, and it is pleasantly exciting to glance from the rose-leaves to the granite work of life. So you have great pleasure in gazing on his face which is grave with care, and bears thought-marks on the forehead—greater interest in that face, than in the hundred handsome, careless faces which have flitted round your path."

Nothing to think about, Lilian ? You grow very silent, the lively dash of your conversation is dulled—your brother remarks it ; he fancies you are overwearied by the walking excursions ; your sprightliness readily returns in his company, but it is with Westby you are silent ; you listen eagerly to what he says, and you ponder it deeply, but you don't reply at great length, for talking to him grows an effort. You are astonished at this change in yourself. Why your high spirits have always headed every occasion, and your self-possession stood ever ready with an answer at your lips. What does it mean ?—not love ?—nonsense, not love !—he is far too good, too clever that he should ever think of you. Then what does it mean ? You could always converse with that young baronet who rode so often last season with you and your brother in Rotten Row, and danced with you so much at London balls : his conversation seemed constrained and stupid, while you could say, without effort, the things that came first to mind. He was handsome, and danced well, and had clear thousands a year ; and girls you knew—girls quite as pretty as yourself—looked on with envious eyes at his attentions, and people whispered that all this would end in an offer. You, amazed with easy conquest, would not believe it ; you protested it was nonsense, that sober marriage would never come from such idle, foolish talk ; you had said nothing more to him than to twenty others. Thus you talked on, and danced, and rode, till one day, the red sun-set evening of a Richmond party, when you had been diverting yourself with good-natured raillery at an engaged couple, the laugh had scarcely died on your lips, when his voice deepened, and the young man offered you his hand ; you were astounded the words thrilled through you, but a 'No' fell quickly from your lips : in a moment you were yourself again, and could speak easily enough—but you can't speak to Charles Westby now.

It is love, Lilian ! though you fight against the thought, calling it folly, and heaping reasons against it. He has frankly told you and your brother all his affairs ; is he in a pecuniary position to marry ? See, with that full ambition which beats at his heart, which makes him almost grudge every passing enjoyment, is it likely that he will as yet seek a partner with whom to *enjoy* life ?

"No," is the reasonable answer to all this. You firmly resolve to hide your folly from all eyes, and strive to forget it when he is gone. He will be gone in a few days; you are almost thankful for that.

*   *   *   *

Charles Westby has gone! Time seems to have stopped at those last two days he was at Interlachen—at that walk which you, and he, and your brother took up the Harder mountains for a farewell look on the meadow level of Unterseen. You are silent, but your brother's spirits are high, and he pledges Westby to such another Swiss tour on his return from India; and then he falls to lightly bantering Westby's hopes and ambitions, predicting this and that legal honour, and the crowning honour, the House of Lords. These light words touch you seriously, and you echo them again, but from the depth of your heart and hope, whence they spring like convictions; so you take comfort in the future. "'One day, who knows? I shall be better worthy of him, then,'" and your old spirits remount, and you are yourself again; but your words are heartfelt though spoken in a light tone.

The whole party rest awhile to look upon the view below, tiny Unterseen and Interlachen in their green meadows half-islanded by the two lakes Thun and Brienz, the opposite distance shut in with granite masses, surfaced with black desolation, or dark green pine, the stepping-stones to the mighty range of Oberland Alps cresting the horizon with their snow-ridges against the cloudless blue. But there is too much inner feeling for you to care for landscape views. And now down hill by zig-zag path, your accustomed laughing challenge is given to your brother and Westby. "Who'll be down first?" It is a rare thing to descend, alpenstock in hand, touching lightly on each broken rock step, governing speed with the pole; it is positive fascination to you now, wearied as you are with much thought. You are a short way a-head, the path winds in the descent, a smooth bank of grass meets the path below, descending by that grass would save half the distance.

"Don't go on the grass for Heaven's sake," shouts your brother from above. But it's too late to stop. It's delicious gliding down, resting on the alpenstock! The grass stealthily shelves up against the path, and in the speed of your descent turns your course, never mind! you will meet the path again at a lower turn, and be down ever so much before your companions. Good God! there is no path below you, nothing but this steep bank of grass, and the valley hundreds of feet below; you strive to stop, to catch at the grass, but the grass is quite short and burnt to the slipperiness of ice. You strive and strive, you would scream for help, but your voice is lost in your frantic efforts to clutch at something; the friction burns through your leather gloves, your head whirls with these desperate efforts. You *have* stopped at last! it is the valley which is rushing up to you!

Little by little you struggle back to consciousness. Where are you? Is it some terrible dream? That fearful valley!—you see it lying rigidly still below you. You are caught in some young pine-stems grown to a foot above the ground. An arm clasps your waist, it is Westby's; his other hand holds to one of the pine-stems which has served to break your fall. The shelving grass suddenly ends at those pine stems, and, from that point to the valley below, there is nothing but precipitous rock. Charles Westby, who was a-head of your brother, saw that those pine stems were your only salvation, and he saw, too, in the direction you were gliding, that you would shoot past them to certain death; he threw his life into your dangerous path, and just succeeded in turning your course at the last moment. You and Charles Westby were hanging over that rocky gulf, it might have been minutes or hours for what you knew of time. Ah, Lilian, what did you say to Charles Westby, then? "Out of the fulness of the heart the mouth speaketh;" and the feeble pine-stems might have given way before help came, and there would be an end of life and feeling on the rocks below. The peasants with iron *crampions* on their shoes, make shift to carry you up to sure ground, and then you faint in your brother's arms. More or less of insensibility to the end of the day, and a night of fitful dreams, the valley rushing up to you with fearful speed, and your sleep broken with cries to Karlo Magno to save you. Sounder sleep towards morning, and you arose refreshed; a few bruises and scratches were the sole physical harm you had received from the accident; but you were still utterly unnerved.

It troubled you most that you could only recollect detached portions of the events of yesterday; some things were very clear, then came complete blanks; and as you sat on the sofa trying to puzzle matters out Westby entered the room.

"I am come to say farewell to Miss Temple."

"Lilian, Lilian! not Miss Temple," you replied.

"Be it Lilian, then,—*playmate* Lilian," he answered with emphasis on the word playmate.

"Oh, Karlo Magno! I hope they have thanked you for me—papa and mamma, and Fred,—how can I ever say what I feel? Your valuable life almost lost for my wilful careless folly."

But gently turning aside your eager words of gratitude, Charles Westby continues in a low voice, "My time is short, and I have something very particular to say. I feel, Lilian, it had been better I had left here long ago."

"Why, why, Karlo Magno?" You tremble with a vague fear.

"My dear girl, in the midst of that chance of life and death, you said that you loved me."

"What, Mr. Westby!" Every vein in your body seems to burn.

"You remember your own words, Lilian."

"That I loved you! You repeat his words mechanically, and are silent awhile. Great marvel and shame that your own lips should unwittingly have revealed the secret of your heart. Yet what matter? If he did love you, that shame would have been lost in bewildering joy, that in any manner he had learnt the truth. Then, by degrees, a cold assurance steals through you that Charles Westby does not reciprocate your love, and gradually you are frozen into self-possession.

"On my honour, Mr. Westby, I cannot remember having made such a confession. My head is in a strange state; I have only a very partial remembrance of the events of yesterday. I well remember my feeling of deep gratitude and admiration for your noble conduct."

"I assure you," replied Westby, growing very confused.

"It is not wonderful that I should have talked wildly and lost my head on such an occasion. I know, Mr. Westby, that you will not hold me to any random words."

And you do govern your features so well, Lilian, that you deceive him into a belief that you had merely uttered empty words, but it is terrible torture to see how infinitely relieved he is. Then he turns the idea of his marriage into a joking impossibility, talking in a brotherly confidential tone of the labour and struggle in store for him. Ay, but it does touch you to the depths of your soul to sit by with a false smile on your countenance, and see that in his heart he only holds you fit for the sunshine and ease of life—you, who for one loving word from him would have rendered back love and endurance, and devotion to the end of existence. Your brother discovers you downcast with dim eyes.

"What's the matter, my pet?"

"Nothing, Fred."

"Not grim Charles Westby, you little goose?"

"Nonsense! just as if he would care for a butterfly."

"But I do believe *it is* that fellow Charles!"

"You are a regular plague, Fred!" And you burst into tears in your brother's arms.

(To be continued.)

REPRESENTATIVE MEN.

Political Philosophers.

MACHIAVELLI: MONTESQUIEU: DE TOCQUEVILLE.

If there are people who really doubt whether the world gets on, one would like to know what they make of such a fact as the appearance and growth of Political Philosophy in human history. There may be some plausibility in the argument that scientific discoveries in the material world may leave men pretty much as they were, intellectually and morally; but when we see that the interests of men in society have so changed and expanded as to enable wise thinkers to discern the principles of politics, and the natural laws which operate upon society as upon individuals, we can no longer doubt that society has reached a point of enlightenment which, on the one hand, is new, and which, on the other, must certainly lead on to further knowledge of the means of liberty and security which, again, must further improve the character of nations, and of the individuals composing them. Any fact which exhibits a new intellectual and moral step taken by any society, and that step rendered secure by its being associated with ascertained principles, is evidence of an actual advance in wisdom and virtue; and therefore the fact that political philosophy has appeared in the world like something new in modern times, and that we have, in political philosophers, a new order of sages, is an evidence of human progress which the veriest cynic must find it hard to get rid of.

It is true, Plato lived a long time ago, and Aristotle was quoted against him for a good many centuries: but any reference to either shows how essentially different political science is from the dreams of metaphysicians, and the corrections of those dreams by a sagacious and practical thinker who could avoid the errors of his time, but had no materials for creating a science prematurely. Plato's pictures of what, in his view, society ought to be are interesting and full of suggestion; and so are Aristotle's wise corrections of fallacies, and discussions of the reasons, and the right and wrong of government: but as there was no notion in those days of such progress as society has made, nothing that could be written could be anything more than a preparation for a real political philosophy: and those who wrote on the subject did so in the course of treating of moral topics, without any conception of a time to come when the principles and modes of government would spread out into a great province of study, in which every man would have an interest, and from which a new and separate order of wise men would issue forth.

The fact is, that till there was a middle class in society in a sufficient number and variety of nations to afford plenty of material for observation and reasoning, there could be nothing like a science of politics. Almost everywhere the rulers had only to take care of themselves, and do the best they could with the privileged orders by whom they were hustled on every side, and the labouring class, far down under their feet. In the few cases of republics which professed self-government, there was no idea of looking beyond the frontier, in which party conflicts were always going on. In those ages, and for long after, there could be no representative men in the province of political research. The order is a modern one, and as yet they and their works are hardly known to those whom they most concern.

It is customary to consider Machiavelli as the first prominent specimen of the class; and even at this day the reputation of the whole order may be seriously injured by the name of Machiavelli having become the current term for extreme political vileness. It is always mischievous, all round, to use any man's name in such a way, because it becomes the slang of the ignorant, and satisfies hasty thinkers with sound instead of sense. There is thus injustice to the individual, and bad discipline to everybody else. In our own day there is talk about Malthusian notions, and a popular conception of Mr. Malthus as unlike as can well be to what Mr. Malthus was and taught; and it would be difficult to exaggerate the mischief done to the last and present generation by this piece of ignorance. The same practice has gone on for more than three centuries in regard to Machiavelli —perhaps with more warrant of truth, but with not less mischief to multitudes who have fancied themselves wise and virtuous in condemning and scorning a philosopher of whom they really knew nothing but the name. It is not our business here to discuss the real meaning of the disputed parts of his writings, on which critical readers

have differed widely. We have only to glance at the position and character of the man who is commonly regarded as the first specimen of the new order of Political Philosophers.

Machiavelli was born in 1469, of an old and noble Florentine family, whose destiny and character determined those of Nicolo, before he was born. Thirteen of them had been governors, and fifty-three had been heads of monastic establishments: they had been banished from Florence, in the adverse turns of politics among the Italian States; and they had witnessed every conceivable play of bad passions in government and war. Nicolo came forward into life and office with these notions of mankind in his head; he had to deal with some of the worst men, in an age when political accomplishment was supposed to mean sharp practice covered by smooth manners. It is remarkable that in his writings should be found some of the highest views in politics, and some of the most benevolent aspirations that have ever been penned; while it is far from strange that, in writing for the Borgias on the art of ruling in their age, he should have recommended as good policy, or allowed as a necessity, kinds and degrees of bad faith which are as revolting to us now in theory, and when we observe them anywhere in operation, as the old practices of crucifying disobedient slaves, and making slaves of prisoners of war. Machiavelli went on five missions to France, with his mind full of the apprehension that France would swamp the liberties of Tuscany. He was three months in close consultation with Cæsar Borgia; and his letters show that it was a case of diamond cut diamond. Two of the acutest men of their age were day and night trying to circumvent each other; and this was the sort of statesmanship which was going on everywhere, from his youth up. It is no small proof of his sagacity that he discerned how far preferable was honest good government to anything he saw. He said that governing by Law was as much better than governing by Force, as men were better than beasts. He believed that the first object, in his time, was to secure stability,—be the government what it might: but not the less did he declare in his writings that the best stability was in the attachment of the people to their prince; the next, that of custom, under an established dynasty; and far below these, the maintenance of a government by the strong hand. He said, in playful conversation, that if he had taught princes how to control their people, he had also done his best to encourage the people not to let their princes oppress them too far. He was disgusted at the practice of employing mercenaries in the conflicts of the Italian States, by which the advantage was given to anybody who had a long purse: and he strove to put an end to the evil doings of a hired soldiery, brought from over the frontier, by raising a militia, and fostering in them a patriotic spirit. All the while, he was thinking. He studied politics in history, and read Livy as no man before him had done, and made Tacitus his model in his book of "The Prince." When his time of disgrace and suffering arrived,—as it arrived sooner or later to every statesman in those days, he showed, in his correspondence, what was then the common notion of political service. He tells of his being imprisoned and put to the torture; and of the annoyance of hearing the screams of other tortured prisoners; and of his banishment to a country residence, where the dread of an ignominious poverty haunted him. These reverses befel him through the accession of the Medicis to the government of Tuscany; yet he hoped that they would give him office, and wrote his work, "The Prince," to remind them of his experience of fifteen years, and of his mastery of the philosophy of politics. He tells, in one of these letters, how he spends his day:—two hours in the wood in the morning, overlooking the woodmen, and bargaining, and hearing complaints about the sale of wood. Then he goes to the fountain, where the birds congregate, and reads some favourite poet, and dreams some poem of his own. Then he goes to the rural inn, and gossips till dinner-time, with passing travellers, of whom he makes a study. The family dinner is a frugal one, furnished by his little farm: and after it he goes again to the inn, and plays a game (not now understood) with the landlord and neighbours,—not without incessant disputes. Evening having come, he goes home, puts off his coarse rural disguise, dresses like a gentleman, and enters his library as a saloon in which he is to meet the best company. There he spends four hours in the most refined society in the world, forgets all his troubles, ceases to fear poverty or death, and utilises the discourse of departed sages, by making it a part of his own mind. In short, he wrote his political speculations and descriptions there; and used his works to recommend himself to the Medicis for employment. "The Prince" was not intended for publication, but for the private use of Lorenzo de Medici, to whom he offered it as the only tribute he had to give, while others presented jewels, horses, and precious stuffs. Some of the counsels it contains are golden; but their influence is spoiled by their association with other sections full of craft and of cynicism.

He employed and amused himself also in literature; but, when Lorenzo de Medici died, he was summoned to counsel again, and entrusted with various reforms and preparations for war. He discharged several missions to neighbouring states, and played the spy on the Emperor's movements on the other side of the mountains. He was subject to a stomach complaint, and at this time (1527) treated it himself, destroying himself by a mistake about his medicine. His age was fifty-eight. He died poor, and no special honours seem to have been paid to his memory till Earl Cowper, in 1787, obtained the erection of a monument in Florence to the first of the new order of great men—the Political Philosophers.

We must remember that the time had not come for a scientific or logical treatment of his subject, any more than for basing a theory of government on ethical principles. It was a great thing that Machiavelli caught and noted fine glimpses of noble truths, and that he was capable of far-reaching speculation, however desultory and partial. A political philosopher he was in a chaotic state of affairs, and if his political morality was postponed to considerations which would be in-

tolerable to us now, we must not judge him as if he had lived among responsible sovereigns and a free people.

The world was in a very different state when Montesquieu opened a new period (if, indeed, it was not the first period) of Political Philosophy. There was not much freedom existing anywhere so as to afford a study of various institutions, and his merit was not that of discovering principles from a wide range of facts. The time for that process had not arrived. But Montesquieu was the first to show mankind that the phenomena of political life, like all other phenomena, are subject to invariable laws. This is the great truth which brings after it all other political truth and wisdom. When it is fully understood everywhere, it will deprive self-willed tyrants of their hope and confidence, and it will create hope and confidence in the hearts and minds of nations. Up to Montesquieu's time, one or another politician had expressed some idea of society making progress ; but no one could give a reason for the notion ; and there was incessant dispute about the fact. When the philosopher had shown that after some things had happened others could not but happen, and from these others again, and that nothing had ever been known to happen otherwise than through some necessary conditions, people regarded the political world in quite a new light. Nations were no longer at the mercy of despots, if any desire of freedom was alive in them ; and any people might obtain freedom by seeking it in a sensible way. The same truth taught them how to learn the sensible way, and to satisfy themselves as to their own qualifications for conducting a good system. But the nation to which Montesquieu belonged did not understand him, and a century after his birth they were throwing away blessings which they were not yet wise enough to enjoy. Their own philosopher could have taught them that ; but he was, perhaps, the only great Frenchman whom his countrymen have failed to be proud of.

He was born in 1689. It will strike the reader that precisely a hundred years later is the date of the political code of principles which won all good hearts to the first French revolution, and which wise statesmen and philosophers still regard as the noblest political creed yet professed in the world. This is quite true. Montesquieu's countrymen did make such a proclamation a century after his death : but they were unfit for acting up to it, and they have never proved themselves worthy of it to this day. But if their great philosopher has not done much for them, he has for other peoples, and for the understanding of the human race at large. He proved that politics are a science, and that political life is naturally progressive. His "Spirit of Laws" is considered one of the three or four books which have educated the mind of Europe, within a century and a half, to a higher point than all other intellectual influences whatever. One of the others is Smith's "Wealth of Nations," which illustrates the steady operation of the natural laws which Montesquieu first pointed out in the province of politics. Montesquieu could not apply those laws to the explanation of facts. He had not got far enough for that : but Adam Smith could do that in the economical department of politics ; and France has yielded political writers abundantly able to use the great truth that Montesquieu disclosed.

He was of an old and noble family whose estates were near Bordeaux, and who had filled offices in the magistracy and in the local parliament for many generations. Charles, the philosopher, had an extraordinary taste for jurisprudence, in his very childhood, and his father believed he would be a great magistrate, in one way or another. He read the classics, and all voyages and travels that he could get hold of ; but his pleasure in them was greatest when he could learn from them something about the laws of different lawgivers and nations. He was incessantly studying the contradictions, and discovering the objects of the obscurest laws, and preparing himself for a great position in the Bordeaux parliament first, and for a higher function afterwards. He filled some local political and judicial posts when he was between twenty and thirty : and when he was thirty two he took the world by surprise with his "Persian Letters." Some persons still prefer that work to any other of his ; but we have here to do with his "Spirit of Laws," which cost him fourteen years of thought and pains, after his "Persian Letters" had given him a great reputation.

The "Persian Letters" contained abundance of sarcasm on the hollow glories of the reign of Louis XIV., which had just closed, and plenty of satire on the social vices which such a reign encourages ; but they manifested also a faith in the triumph of reason and right, an admiration for popular liberty, and a hearty concern for the best interests of society which prepared the mind of the few thoughtful readers, among the multitude who devoured the book, for what at length followed. One result of its popularity was that it decided its author to retire from his judicial office, and devote himself to study and writing. He quizzed the booksellers who, he declared, went about pulling by the sleeve every likely man they met with the petition, "Do write some Persian Letters for us ;" but the popularity itself was no joke to him, as it altered the course of his life. He showed, in a noble discourse before the parliament of Bordeaux, what he conceived to be the functions of the Bar and the Bench ; and he was not satisfied with his own discharge of them. His eyes served him soill that he could neither write nor read notes with any facility. He could not take the trouble to correct his broad provincial dialect. He was of a rather lumbering habit of thought, though quick and gay in wit and humour ; and he was so shy that, as he said, the mere feeling that anybody was listening to him put to flight all his ideas, tied his tongue, jumbled his words, and clouded his faculties, so that the very subject he had to speak upon vanished from his mind's eye. If all this was true, he was certainly not made to be a judge, and was wise to sell the place, as such offices were a matter of purchase and sale in those days. He sought a seat in the Academy, on devoting himself to a student life ; but certain priests protested against the admission of a satirist who had jested

about the sacred things of the Church. He was indignant, and declared that he would seek elsewhere the repose and appreciation which were denied him in his own country; but he also, by means which are differently represented, propitiated both Cardinal and King; and he delivered his inaugural address in the Academy in January 1728. Everything seemed now prepared for his saying, and the world hearing, what he had to utter on political philosophy; but he chose to travel first, and see for himself the real condition of people and their rulers in most of the countries of Europe. He began with Germany, and proceeded to Italy, Switzerland, Holland, and England. He had met Lord Chesterfield at Venice, and again at the Hague; and they were great friends; so that it was no wonder that he came to England, nor that, when here, his relish of our political institutions induced him to stay two years. There are traces of his presence in London society at that time. He was a member of the Royal Society; Queen Caroline distinguished him, undeterred by his absent manners, and appreciating the grace of his wit, and perhaps the force of his satire, whenever he rallied his faculties for conversation. One story is that when an anecdote was pressed upon him which he did not believe, and the bore who urged it said that, if his fact were not true, he would make Montesquieu a present of his head, the philosopher replied, "I accept it: these little presents keep up the warmth of friendship."

Within this century it has become known that Montesquieu wrote, either before or during his travels, a short treatise which he got printed in Holland, on the impossibility of any universal monarchy in Europe. He suppressed it, however, apprehending that it might be dangerous to show why no power could henceforth subjugate the various populations of Europe. He published instead, in 1734, his "Considerations on the Causes of the Greatness and the Decline of the Romans," which answered the purpose of showing that their feat of universal empire could never be repeated.

The subject had been often treated; but there was more to the purpose in Montesquieu's single volume than in all the one-sided views and random eloquence of his predecessors. Yet it was but one branch of the subject he was meditating, the greatness of which weighed upon his heart. Sometimes, as he tells us, he believed he was getting on by strides,—so clear was the truth he had to illustrate; while, at other times, he felt as if he should never move another step, under the burden of so vast a meaning as his book was to bear. He was anxious to be as brief and as emphatic as he could, in order to win readers; and this seems to be the reason why his style is far inferior to his subject. He was as fond of Tacitus as Machiavelli was; and he tried to imitate his style, without parting with his own French epigrammatic mode of expression. The result is a kind and degree of affectation displeasing to English taste; but the point of view attained in the "Spirit of Laws," the wealth of significance which it bears, and the noble spirit which breathes through it shame a l objections about minor matters. It is a remarkable circumstance that his own judgment of his work varied with his mood of mind up to a certain point, and then became fixed. He asked his honest friend Helvetius to read his manuscript, and tell him what he thought of it. Helvetius objected to several things, and especially the main doctrine of the treatise. Indeed, he thought so ill of the work that he dared not, for some time, say what he thought,—that Montesquieu would lose reputation entirely by it; and he secretly consulted Saurin (author of "Spartacus"), who was exactly of his opinion.

It is amusing to read now the letter of Helvetius to Saurin, in which he says that they need not fear offending Montesquieu, who will answer their remonstrances with witticisms, and go his own way; that it is useless to hope to turn him out of the way of destruction; but that it is a duty to themselves to take care that, when the day of ruin overtakes him, he shall have no cause to blame his friends for want of warning. Montesquieu's reply to his critic was that he now perceived the work was in advance of his generation, and he must issue it according to his own views; and he had now come to the end of his vacillations about it. It was published in 1748; and within a year and a-half it had gone through twenty-two editions at Paris, and was translated into almost every European language. Men of literary curiosity relished it mightily. Horace Walpole, for instance, calls it "the best book that ever was written." Men of kindly sentiment enjoy its genial and hopeful spirit. But it required a philosopher to see its true significance, in discovering the relations of politics to science. It is easily criticised, for some of its views as well as its style; but its radical thought,—that political phenomena are subject to natural laws,—placed its author at once above all his predecessors in his province of study.

In seven years he was dead. He died of inflammatory fever, in thirteen days,—aware of his danger throughout, and with all his faculties in their natural vigour, as far as could be seen by his fencing with the Jesuits who came about him as he was dying. "You know," said one of them, in administering the viaticum, "how great God is." "Oh, yes," replied he, "and how small men are."

It is not difficult to account for Montesquieu's great work having been most valued in England and least in France. In spite of the dozens of editions demanded at Paris, the book failed to modify French thought; and political speakers and writers went on romancing the more, as the revolution drew on, about the first principles which they derived from imagination, or from a poetical view of the events of history. In England, the bent of the national mind was favourable to Montesquieu's method of studying the wide range of facts of social experience, in order to ascertain from them the laws which governed them, and which must govern the history yet to be enacted.

When the "Spirit of Laws" appeared, Edmund Burke was under twenty years old, but quite wise enough to enjoy and profit by it. We may fairly suppose that he did, not only because every student of politics read it, but also from the

character of Burke's first publication, — the "Vindication of Natural Society," which pretended to be written by Lord Bolingbroke. Burke was then only six-and-twenty; but he had made up his mind, which he never changed, against the *à priori* method in political philosophy, which he was to see reach such a height of mischievous absurdity in the French Revolution. It is true, we of another century may think that Burke carried his reverence for natural laws of society into superstition when he discouraged action, and admired passive waiting on the course of human affairs. It is true, we may see how unwelcome his incessant announcements of the results of his reasonings were in parliament, where the members were divided between poetical and sympathetic enthusiasm about the metaphysics and sentiment of French politics and the hard dry notions of practical politics which prevailed under an ignorant and wilful king and a Tory party at which the country would blush at this day. It is true, Burke left no great single work, general in its character, and thorough in its treatment of a province of philosophy; but yet he was a representative man in political philosophy. He united in himself the intuitive perception of general truths which some persons suppose to constitute a proof of first principles, with the clear and constant conviction that the search for first principles in politics is as mischievous as vain. While Montesquieu's countrymen were preaching away about social contracts and savage states of society, and natural social rights, and personifying abstractions of any sort that pleased their fancy, Burke,—the born-poet, the man of imagination, fancy, sympathy, which so abounded in him that he might have swamped the whole supply paraded by the French revolutionists,—this fervent speaker, who might have beaten all the metaphysicians and all the political discoverers with their own weapons, never ceased his exhortations to legislators and society to abide by facts, and to reason from known particular facts to the ascertainable general facts which we call laws. We cannot regard Burke as the founder of a school, or the discoverer of any new department of politics: but he was a teacher whose wisdom will drop into many minds of each generation for long years, perhaps centuries, to come. No one can travel in America without being struck with the veneration in which Burke's utterances are held there. The fact is singular, considering the metaphysical quality of American politics, from Burke's time to the present; but it shows what his sympathy with revolutionary France might have been if he had not been guarded by an early recognition of the true character of political philosophy,—derived, perhaps, in great measure, from Montesquieu. The prevalent character of political speculation in France at this day enhances the delight of the study of Burke, in whom we find all the ideality of the metaphysical school, together with the sound wisdom—the intense common sense—of the higher and humbler students who are thankful to learn from a wide range of events, rather than from a group of notions fetched from out of their own brains.

Those who are old enough to have seen how the House of Commons looked while Sir James Mackintosh was speaking, can bear witness that our legislature has no real and permanent antipathy to political philosophers. Too much of the conduct of our parliament looks like it; and it will be an undying tradition that the House emptied when Burke spoke, while it has never failed to rally to hear the coarsest libeller who will amuse it with personalities, provided he has sufficient smartness. Yet a metaphysician and a man of speculative genius may win homage, in spite of his strongest qualifications, if he can gratify his hearers with some others. They listened eagerly whenever Mackintosh spoke, though he was first known as a political philosopher. He does not, however, belong to my subject, for he was by no means a representative man in political philosophy. Neither can we assign that character to our benefactor, Mr. Hallam, substantial and invaluable as are his services. He has promoted political thought among us by enabling the present generation to understand the constitution under which they live. His statements instruct us; his reasonings enlighten us; and his inferences set us thinking: but his function has been only critical. He may, probably, have helped to make some future political philosopher; but he was not himself one of the supreme sages of the order.

As France has supplied a science of History to the nineteenth century, so she has perhaps supplied the purest example of a political philosopher. De Tocqueville answers more entirely to the description than any other man of our time; and not the less, if his function was rather to illustrate the operation of known laws than to make discoveries of new ones. Born into a position (like that of Machiavelli and of Montesquieu), favourable to observation without passion or prejudice, De Tocqueville looked out upon social life with a fine faculty of insight into its workings, and a kindly heart, sensitive to the present troubles and the future dangers of society. His life was distinguished accordingly by his emphatic warnings of the near relationship of democratic equality to subjugation under a despotism, while his cautions were rendered trustworthy by his hearty appreciation of the blessings of genuine freedom.

His misfortune was his French tendency to a logical treatment of an idealised theme. It was this which obstructed the effect of his "Democracy in America" upon the people of the United States. The Americans have no sort of objection to even an *à priori* handling of political doctrine (witness their own Declaration of Independence). However it may be with their responsible statesmen, the reading public there is certainly favourable to an idealising and metaphysical treatment of any subject,—and of politics among the rest; but De Tocqueville's procedure was rather too plain before their eyes. He saw few people, he did not go southwards beyond Washington, and conversed very little; and the remark was that his book might have been written in his own library, without the trouble of the voyage. He himself declared that he had wrought out his exposition from the scantiest supply of facts, just as Cuvier would have elaborated an entire unknown animal from the aspect of a tooth. It is true, there was too

much assumption of the infallible working of known laws, without doubt or distrust as to the intervention of anything unexpected; and the usefulness of his work among a people singularly in need of it has been restricted accordingly; but not the less has De Tocqueville been, for thirty years, up to the time of his lamented death in 1859, the representative political philosopher of the time. This philosophy was his pursuit, his engrossing interest, the proper field of his genius, and the natural channel for both his patriotism and his general benevolence. At the same time, it enhanced instead of mitigating the great grief of his life,—the suppression of liberty in his own country. His thorough understanding of the causes of the submission of France to the existing despotism aggravated his keen sense of the calamity; and his hopelessness of the course of affairs cast a deep shadow over the last years of his life.

He was descended from an old and noble family in Normandy. Louis XVIII. restored the title of Count to his father, and it is still borne by his elder brother; but Alexis never adopted it, having, as he said, no inclination to accept a distinction which had for ever lost the characteristic of honour which made titles worth having. He was ten years old when the First Empire closed at the battle of Waterloo. During the subsequent Bourbon reigns he was diligently prosecuting his education, and on reaching manhood ranged himself with the liberal party, clearly anticipating the downfal of the Bourbons. He regarded the accession of the Orleans family and policy as only a new stage in the revolution, because he saw that there was no preparation of the mind of the French people for withstanding the despotism which inevitably accompanies an immature growth of democracy. In 1831 he went to America, and in his work on "Democracy in America" he gave utterance, in a philosophical form, to his clear views of the prospects of his own and every other country in which the democratic principle has established itself unwatched and unchecked by political philosophy incorporated with practice. He was almost as much at home in England as in France, and his hopes found a resting-place in the sound quality and natural growth of English liberties. Such comfort as he experienced, as a political philosopher, during the last depressed years of his life, were derived from our country; and this should be at once an admonition and an encouragement to us to take heed to the lessons and the prophecies of the one political sage of our times.

It is plain to all eyes that the lesson is needed. Everybody is aware that the present condition of politics cannot last. In the absence of political parties marked by oppositions of principles, we are halting between two opinions in a way which can bring nothing but disaster. A democratic tendency is now universal, and cannot be arrested; and to ignore it in the freest country in the world is fatal folly. It is not to be expected, especially in England, that practical statesmen should be political philosophers. Ours are not, and do not pretend to be so. But they might look for guidance in the wisdom of those who are; and this is what no statesman of any party is at present doing. The existing and all recent parliaments have displayed an insensibility to the situation which De Tocqueville could have shown them, and which his works do show, to be very perilous; and the elements of discontent which are gathering outside of political expression are, as he would avouch, more dangerous than any mode of expression that they could find under the forms of the constitution. It is by bad faith and ignorant levity that they have been excluded: and it is only a question of time whether the enlarged franchises and reforms now for some time due shall be obtained with such safety and tranquillity as may still be possible, or be imperiously demanded by an exasperated popular will which shall overbear, more perilously than thirty years ago, the power of resistance rightfully belonging to the classes who ought to be the exemplars of the cultivated intelligence of the country. After all parties have agreed that there has been a great advance in the intelligence of the people, and that that intelligence is a sound title to a share in political counsel and action, it is rash in the extreme to delay the admission on false pretences, or by catching at accidents, at home and abroad. If De Tocqueville were among us now, there is no doubt what his opinion of our present parliament would be, and his writings ought, by this time, to have made our rulers wiser than they are. We may hope that the people of England will yet cause his name and fame to be honoured among us as they deserve. Harriet Martineau.

THE HARVEST MOUSE (MUS MESSORIUS OR MUS MINUTUS.)

Many persons would be surprised if they were told that a new quadruped had, within some few years past, been discovered in this island; and yet it is so. Mr. White of Selborne was the person to do this, and his researches were rewarded by his introducing to naturalists the harvest mouse, certainly the smallest four-footed animal we have. We will proceed to give some account of it, and it will be found from its manner of life that it is possessed of equal sagacity with the larger kinds.

We have stated that Mr. White was the first person to bring these animals into notice, although from the account he has published in his charming "Natural History of Selborne," he was evidently ignorant of many of their habits. We will endeavour to supply this deficiency, and the account may prove interesting to those who are little acquainted with the animal in question.

The length of the harvest mouse, including the tail, is four inches. Its colour a beautiful reddish yellow on the back and sides, the whole of the under parts being a pure white. The head is small, the nose sharp, the eyes large and prominent and jet black. The whiskers are numerous but weak, ears short, the fore-feet small, with four toes and a rudimentary thumb. The nails are long in proportion, and with them the animal firmly holds its food, and conveys it to his mouth. The hind feet are much longer and stronger, having five distinct toes, long and covered with fine hair to the nails. The tail is equal in length to the body, prehensile, thus greatly assisting them when climbing amongst the grass. Weight, two penny weights

and eighteen grains. All the movements of this little creature are agile and graceful. When seated on their hind legs they are capable of extending the body to a considerable angle like the kangaroos.

A nest, containing a female and three young ones, was taken in a hay-field in the month of June. The young were apparently about a month old. They were all placed in a cage, where the young ones grew rapidly, and in a short time could feed themselves, although the mother continued to suckle them. They were the most playful, as well as diminutive of all quadrupeds, being in constant motion during their hours of exercise, climbing about the wires of their cage, and holding by their prehensile tails, frequently hanging by one foot and the tail. They sometimes fed during the middle of the day, but more generally in the evening, at which time they are most active between the hours of nine and eleven, and perhaps most part of the night. In their gambols the eye can scarcely follow them, such is the rapidity of their motions, for they dart like lightning, scarcely appearing to touch the ground. Their cage

was six inches high from the bottom to the top wires, and it was a favourite exercise to leap from the bottom to the top, in the same manner as the leopards and tigers in confinement. This feat was done by all in succession, as if they were following their leader. When the height of the animal and the spring are taken into consideration, it may be considered enormous, being twelve times as high as itself. They are fond of canary seed, barley, bread or biscuit. They drink frequently, by lapping like a dog. In their state of freedom, the pearly dewdrops must be their beverage, as the fields where they were taken are dry, having no water of any kind.

The nest of this pretty little animal is made of grass, formed into a ball about the size of a cricket-ball, and is suspended on a plant about five inches from the ground, sometimes, as Mr. White informs us, on the head of a thistle. He also says that it is so compact and well placed, that it will roll across the table without being discomposed, though it contains eight little mice that are naked and blind. As the nest which he saw was perfectly full, Mr. White asks how could

the dam come to her young, so as to administer a teat to each? Perhaps she opens different places for that purpose, adjusting them again when the business is over; but she could not possibly be contained herself in the ball with her young, which, moreover, would be daily increasing in bulk. This wonderful procreant cradle, an elegant instance of the efforts of instinct, was found in a wheat-field, suspended in the head of a thistle. In winter, the little animal burrows deep into the ground, and makes a warm bed of grass. Edward Jesse.

TOWN TRANSIT—THE AIR LINE.

We have had propositions of various kinds to facilitate passenger traffic in our streets—railways on the street-level—railways below the streets—and railways over the house-tops. We have, moreover, the electric telegraph, supposed to dispense with both letters and persons in the way of communicating intelligence. But, strange to say, even the telegraph people themselves, in the dispatch of their own business, found that their public scheme of word-transit would not answer their private purpose. So they revived on a small scale the proposition of the engineer Vallance, for a tube to carry passengers between London and Brighton by means of air pressure, but substituting the natural pressure of air behind by an exhaust in front, instead of direct pressure by mechanism behind. "Better lead than drive," is an old proverb, and the air and the donkey are alike in this respect, for the air sets up a great resistance to being *forced* through a tube, but is very amenable to suction.

Coleridge, in the "Ancient Mariner," asks,

> Why drives on that ship so fast,
> Without or wave or wind?

And the answer given is—

> The air is cut away before,
> And closes from behind.

With all due submission to the poet, there was no marvel in this case; it was wind—and nothing but wind—caused by the air rushing to supply the vacuum.

The electric people laid down, from one office to another, a lead pipe some two inches in diameter, with an air-pump attached at the delivery end. The pipe passed downwards under the street, up again, and the open end curled over the office desk. A short cartridge-looking case with an opening at the side, to contain a roll of paper, being put into the pipe, and the pump set to work to exhaust in front of it, created sufficient vacuum to cause a rush of air and wind behind, and propel the cartridge like a bullet through a gun-barrel till it fell out on the desk where it was wanted.

To do this on a larger scale simply needed a larger pump or exhaust. But people did not contemplate a tube large enough for passengers, and so Mr. Clegg devised a method of driving a piston in a long pipe with a side slit to connect the piston with a train of carriages, closing it with a leathern valve and a coating of waxen salve. This was put in practice on a steep curving line of railway called the Dalkey, about a mile in length, joining the Dublin and Kingstown. A single carriage worked in this way brought passengers on to the line and took them to the top of a breezy hill by this kind of air-rope, which did not pay by itself, but served as an attraction to make the main line pay. The late Mr. Brunel was encouraged by this to make the South Devon line full of steeps and curves, and applied the system, but it failed at a great loss to the shareholders. It was again tried on the Croydon line, and again failed. The leakage at the long side-valve was fatal. Had the poet stood by the side of it, he would have found that the cutting the air away before did indeed cause a "rush," not merely behind, but sideways. It would have pulled in a truss of straw, had there been room, or a dog's leg, or a small child, or any moveable lying at hand, not too large or too heavy. It would have carried off every note in the Bank of England—both "stiff" and "flimsy"—and tried hard at the "blunt." But the pumps had to work so hard to keep down the leak that it would not pay, and so, one fine morning, the manager caused the whole of the pipes to be pulled up and the pumps to be pulled down, and there was an end of it.

It has been revived again by Mr. Rammell, under the name of the Pneumatic Dispatch. He has got together a company with men in it who have known something of business—the Marquis of Chandos and Captain Huish, so long on the North-Western Line, and a sample has been laid down at Battersea. But in this case the vehicles are put inside the tube, which is thirty inches in diameter, and so form the piston.

The tubes are of cast iron, and are laid with ascents and descents of one in twenty-two and one in twenty-five, and with very sharp curves. The exhaust is produced by a fan of large diameter. When nearly at the end the carriages are turned by the rails into a separate tube with atmospheric air in it, which is compressed by the momentum, and forms a buffer. Just at the time the carriages stop, they touch a trigger, which throws open the door at the end of the tube, and then the carriages run out into the open air.

Without at present entering into the cost of power, there is no doubt that the plan is effective, and effective under very unfavourable circumstances of trial, the friction being far greater than is needed, and the fit of the vehicle in the tube being far from so accurate as it might be. Moreover the test in a small tube is much more severe than in a large one.

The pressure obtained was about 40 lbs. to the square foot, and the area is about five square feet; the speed was about fifteen miles per hour.

With this arrangement transit over the house-tops becomes practicable. A tube of wrought iron plate to carry a carriage eight feet square, or sixty-four square feet of section, might be constructed, weighing about 12 cwt. per yard, run, at a cost of about 12,000*l.* per mile, and this tube might be glazed with small pieces of plate glass, so as to give ample light. A carriage carrying 50 passengers would weigh about 3 cwt. per foot run, or a total of 4½ tons. Thus 200

passengers on a train over a street of 120 feet wide, would only be 18 tons, or one-third the weight of a large locomotive and tender, and the power required to draw it on the level would only be about 250 lbs., or 4 lbs. per foot of area. At a maximum pressure of 40 lbs. per foot a train of 1200 passengers might be taken.

The advantages of such a system would be easy and sheltered, yet light, transit, with perfect ventilation and freedom from dust, smoke, or vapour. The disadvantages would be "such a getting up stairs." But this might be alleviated by mechanical lifts, performed by the same engines used to obtain the vacuums. Whether the houses would be strong enough to carry the load, and whether the owners would demand too much rent, are other questions. The question of noise does not raise a difficulty, for the movement might be almost noiseless. The safety would be absolute. There would neither be engines to explode or run into trains a-head, nor trains to get off the line.

It is a question of cost, but it would be difficult to make it cost so much as portions of the Blackwall line.

Anyhow, the air line is as much a practical thing as the telegraph over the house-tops, and only a question of cost and ownership.

And, if an underground line is a necessity, the iron tube air-worked is the only plan of wholesome transit.

W. Bridges Adams.

GUILBERT FITZ-RICHARD.

A.D. 1070.

A Song of a Saxon Gleeman.

"One alone amongst all the Conqueror's train claimed neither lands, nor gold, nor women: he was named Guilbert Fitz-Richard. He said that he had accompanied his lord into England, because such was his duty, and that he was not to be tempted by stolen property, but would return into Normandy to live on his own patrimony."

Augustin Thierry's "Norman Conquest."

I.

The Saxon folk were scatter'd like chaff before the wind,
With the good greenwood before them and Norman knights behind;
Their Leofrics and Edrics, with blue eyes and golden hair,
Were flying for dear life to couch with the wild beast in his lair.

II.

The Norman Jongleurs flouted them with gay songs to Norman lyres,
What time, as serfs, the Saxons tilled lands won by Saxon sires;
Their daughters dear were led away, as the Saxon annal saith,
By Norman squires, poor lemans fair, that wept and prayed for death.

III.

The stalwart sons of Saxon earls the Norman sold for slaves,
To his Lacys and De Bracys, Montmesnils and De Graves,
Those beggar knights of Normandie, whose fee was sword in hand,
Spread, since the fight of Hastings, like wolves throughout the land.

IV.

The wailing wife who wept her lord at the rout of Hastings slain,
Sword at her throat, was wedded to some churl of William's train,
Ennobled for a bowman's deed done at that bitter fight,
This churl knelt down a bowman and rose up a belted knight.

* * * *

V.

Now glory unto Guilbert, De Chesney's stout esquire,
Whose iron arm at Hastings was never known to tire,
Who loved his lord, and followed him for the love of chivalrie
To the good green fields of England from pleasant Normandie.

VI.

No spoiler he, no ravisher—upon his blade no blood,
Save that of Saxon foemen in honest fight that stood;
Our franklins honoured Guilbert, in our anger's hot despite,
So gentle after conquest, so valiant in the fight.

VII.

No Saxon mother could to him her suckling's slaughter trace,
By him no father tore his beard for a daughter's foul disgrace;
Quoth Guilbert, "Spoil I seek not, nor land, nor lady fair,—
The fight is done, the Norman's won, and home will I repair.

VIII.

"Oh! dearer far than English land, though fair its meads they be,
Are the hills, and heaths, and sunny slopes of distant Normandie,
And dearer is my sunburnt maid in a grey old Norman tower,
Than the daintiest dame of Sussex with her broad lands for a dower.

IX.

"I followed thee, De Chesney; my duty I have done;
Knight, give me back my fealty, and let me now be gone
To the land where first I drew my breath — that grey tower by the sea,
Where a maiden's weeping half the day in her weary watch for me."

X.

"What!" said the haughty Norman, "and dost thou look so low?
And wouldst thou yield to baser hands what well thou'st won, I trow?
Nay! in this land God gave us and our trusty Norman swords,
Dwell—see thy children's children these Saxon varlets' lords."

XI.

"Nay!" quoth the gentle Guilbert, "by Him that died on cross,
If I could gain all Sussex soil, I'd count it but a loss,
If far away from hope and home for life I so must be,
Far from that Norman maiden who pledged her troth to me."

XII.

God's blessing on thee, Guilbert, a fair wind speed thee home!
Skim like a sea-mew, Norman bark, across the yeasty foam;
And when the news to England comes that Guilbert's knell doth toll,
Each Saxon priest free mass shall sing for gentle Guilbert's soul!

W. B. B. Stevens.

HER MAJESTY'S BIRTHDAY CELEBRATED ON THE PEAK OF TENERIFFE.

On her voyage home from China, Her Majesty's ship Fury touched at Teneriffe, and the captain with some of the officers determined to celebrate the Queen's birthday on the summit of the famous Peak, while at the same time the usual honours were being paid on board the ship. Accordingly a party, consisting of Captain Bedford Pim, Lieutenant Perceval, Lieutenant Godfrey, Royal Marines, Lieutenant Gordon Stuart, St. Helena Regiment, and T. E. Boileau, Esq., started from Santa Cruz at 11 a.m. on Wednesday, May 22nd, 1861, *en route* for Orotava, from whence the ascent of the Peak must be made.

Laguna, the capital of the island, was reached at 12·30, after which the aspect of the country gradually improved, until at Suazal, which is about half way, the valley of Orotava opened upon the view, displaying scenery the beauty of which it would be difficult to exaggerate. At Suazal it is the custom to rest the horses and take dinner, which is served in the old Spanish fashion; the party, however, by a great effort persuaded the cook to forego the usual bountiful allowance of garlic. From Santa Cruz to Suazal there is an excellent, broad, macadamised road, but from the latter place to Orotava it is nothing but up hill and down dale, with very sharp curves at the bottom, round which the coach is driven at ful gallop. The team, generally mules, require more attention than the coachman alone can give, and therefore a boy is employed to run alongside the animals, thrash them, clear them, and make himself generally useful. When the speed is considerable he seizes a trace, and contrives to keep pace with his charge until going slowly again. On the present occasion the lad unfortunately tripped, fell under the mules, was kicked by the near wheeler, and then the fore wheel passed over him. The coach was, of course, stopped as quickly as possible and the boy picked up; the poor fellow was severely injured; he was carried to the nearest house, where his wounds were bound up, after which the carriage pushed on, some of the party walking, so as to give him plenty of room. Finally he was lodged in the hospital, and a handsome subscription collected, the doctor asserting that the cure would be rapid and complete.*

* "The little boy is all right again, and, though still in bandages, has returned to his duties. He expresses much gratitude for the generous relief left for him in my hands But, from his way of taking the matter, I fear he will, or, at least, may be, killed outright the next time British officers go to Orotava, as he will certainly fling himself under the carriage wheels."—Letter from Mr. Consul Johnston, dated July 13, 1861.

La Puerto de Orotava was reached at 7·30, and very good accommodation obtained at the fonda or inn situated in the Plaza.

The town of Orotava, or "La Villa," is built some distance up the valley, while the port, or "El Puerto," is of course on the coast; from either place the ascent can be made, but the Puerto is generally chosen because an English gentleman (Mr. Goodall) residing there takes pleasure, in the kindest and most disinterested manner, in making all the arrangements necessary to insure the comfort and success of his countrymen.

At 10 in the evening the party were gratified by a full view of the magnificent Peak. The clouds had dispersed, leaving a brilliantly clear sky overhead, while the full moon illumined a scene scarcely to be surpassed.

The forenoon of the following day (23rd) was spent in necessary preparation, and at 3·45 p.m. the travellers left the Puerto, and almost immediately commenced ascending. The cavalcade had quite an imposing appearance, each horseman having a native in attendance, as also a man for each baggage mule, while a guide in his picturesque mantle headed the procession.

The baggage consisted of two barrels of water, corn for the horses, food, wine, fireworks, and warm clothing. Hard boiled eggs, fowls, and bread formed the staple of the eatables; coffee, wine, brandy, with champagne for the Queen's health, the drinkables; the fireworks were from China; the warm clothing consisted of coats, blankets, and wrappers to keep out the cuttingly cold wind.

The afternoon was warm, thermometer 84°; but very soon after leaving El Puerto the temperature cooled, and by 5·15 it was 68°, at which time the last village was passed. Nothing could be more rugged and toilsome than the road; in many places, after winding about for an hour, not more than a mile was gained. At 6·30 the ultima thule of cultivation was reached, and the party found themselves fairly enshrouded in the clouds, when a halt was called, and additional clothing put on, the temperature 58°, and heavy drizzle falling. A Spanish scarecrow loomed gigantically through the mist from the last patch of cultivation, and proved to be the last vestige of civilisation.

It was still light at 7·30 when the moon rose, the horses therefore were enabled to pick their way; but how they managed to keep their footing was a marvel, the track being of the very worst. At length, soon after 8, the glad tidings that half the journey had been accomplished was announced, temperature 42°. Hardly had this good news been imparted when the clouds and mist assumed a gauze-like fineness, through which the party soon penetrated, and a scene lay before them which called forth the involuntary admiration of every one, and caused the toil of the ascent to be forgotten in a moment. Below, to the northward, the clouds rolled along like hummocky ice-fields, while a magnificent lunar rainbow spanned that part of the heavens; above, the sky was cloudless, brilliant with stars and full moon; right in front was "the Peak" rearing upwards, its gigantic form so clear and well defined, that it

was difficult to believe it out of reach, while to the right and left lay immense blocks of rock in every conceivable form as far as the eye could reach.

After various rhapsodies had been indulged in, the horses again scrambled forward about half-a-mile, when the Estancia de la Sierra was reached, and an hour's rest and refreshment taken by man and beast—temperature $38\frac{1}{2}°$.

Several attempts were made to sketch the scene from this bivouac. The outline, indeed, of the noble peak was obtained, but the lunar rainbow, stratum of clouds, bright sky, wild and picturesque groups of men and horses round the fire, with the background of rugged rocks heaped into all sorts of fantastic shapes, proved too much for the artists, who were fain to carry off only an indelible impression on their minds.

About ten the cavalcade again proceeded and now found the road much better, leading over an extensive plain of pumice, which reaches quite to the base of the peak. This pumice has all the appearance of a light-coloured gravel, and is simply the congealed froth or foam of the volcano. It has probably been thrown down in a shower, and subsequently huge masses of slag have been sprinkled over it in every direction, the dark colour of which contrasts strongly with the reflected light of the pumice gravel upon which it rests.

Over these plains the horses made good progress, passing several patches of snow, and after resting a few minutes at the foot of the peak commenced

the ascent of that "mountain on top of a mountain." Scrambling, rolling and pitching, in a manner which rendered it difficult to keep the saddle, the party toiled upwards, and at length reached the "Estancia de los Ingleses" or resting-place of the English; much to the delight of the English, at least.

It was now eight minutes past midnight, and therefore the commencement of her Majesty's natal day, the announcement of which was received in a truly British manner, although the cheers in that rarified atmosphere were by no means so resounding as they would have been in the foggy climate of dear old England. The preparations were soon completed for the display of fireworks, which were pronounced "magnifico!" by the muleteers and guide. Fortunately the clouds cleared away, and the shoulder of the peak, illuminated by various coloured fires, was seen and admired by the people 10,000 feet below, and for many miles round. The inhabitants of the quiet valley of Orotava will therefore most probably remember the day of the month on which her Majesty the Queen of England was born. At 2·30 the horses were again mounted and urged upwards, and after a nervous and most uncomfortable ride reached Alta Vista at a quarter past three. This small level spot, beyond which neither horses nor mules can go, was the site of Professor Smythe's observatory, the walls of which are fast falling to decay; here every vestige of vegetation ceases, and the thermometer having reached freezing point, with

a fresh S.W. wind blowing, it proved but a bleak resting-place. Accordingly the horses were immediately sent down again to the Estancia de los Ingleses, while the party lost no time in completing the last 1000 feet of ascent. If the road was bad before, it was ten times worse now. Each one had to look out for himself, scrambling and jumping over sharply pointed blocks of slag of every conceivable size and shape, to the serious detriment of cuticle. At last, however, this gymnasium was cleared, as also some patches of hard snow, when the travellers found themselves at the foot of the cone, composed of ashes and scoriæ, which forms the true summit of Teneriffe. To climb this proved no easy job, its moveable surface being held so loosely together as to yield readily at each footstep; however, about half-way up, the pumice-gravel gave place to a more solid footing, and a little more patience and perseverance enabled the party to gain the top just before the sun rose. The daylight had been spreading upwards, and to the right and left, for some time previously to the advent of the great luminary, therefore every one was prepared for his appearance; but imagination fell far short of the reality, when the huge disc of a blood-red colour was observed to rise majestically from the ocean and assume the command of day. Turning round from the contemplation of this glorious scene, another scarcely less wonderful struck every one with astonishment; this was the shadow of the gigantic peak stretching away upwards of fifty miles, and partly eclipsing the isle of Gomera. This monster shadow, the largest in the world, was defined so clearly that one of the party waved his cap on the edge of the crater in the hope of seeing the action reflected, after the manner of the human figure on the summit of the Brocken, the loftiest of the Hartz mountains, but the closest scrutiny failed to detect any corresponding movement. It was a wonderful sight, standing on the highest pinnacle of the great peak, 12,200 feet above the sea, to look down upon the panorama of the eastern part of the island, bathed in the glow of the rising sun, while all to the westward, including the greater portion of the island of Gomera, was wrapped in the deepest gloom.

The summit of the peak is simply the edge of the wall, forming the crater, and is therefore very narrow, so much so, indeed, that only one person can stand on the extreme top at a time. The brim of the crater is not horizontal, like that of Fayal, but dips to the southward as much as 45°; all action has long ceased, and now hardly a wreath of escaping smoke is perceptible, although the entire surface is caked with sulphur, and many fine crystals are lying about. A strong S.W. wind blowing keenly, with a temperature below freezing, stagnated the blood of all the party, so long used to the warmth of the tropics, and compelled them to seek shelter under the lee of the summit-blocks, where, in a short time, circulation was restored; rather too quickly, indeed, as was proved by the captain's inexpressibles, the seat of which was completely burnt through. It appeared that all over the top, at less than two inches below the surface, the temperature was above boiling point, the bulb of a thermometer just placed in the ground caused the quicksilver to rise immediately to the top of the scale, and the tube would have been broken had it not been instantly removed. After this caution, every one, as may readily be imagined, moved about with extreme care, visions of boiled travellers rising vividly to the mind's eye.

The clouds which the party passed through on the ascent quite dispersed as the sun arose, leaving hill and valley, cultivated ground and barren ridge very distinct, so much so, that some one declared he could see the "Fury" in Santa Cruz Roads—quite possible, with the aid of a good glass. The view was lovely and most extensive, the visible horizon being 140 miles distant, Gomera, Herro and Palma plainly visible to the south and west, while to the north and east only the summit of Gran Canaria could be seen rising through the masses of clouds which obscured the low lands; these clouds in several places rested on the bosom of the ocean, and looked exactly like floes of rugged ice in the Arctic Regions.

Having thoroughly enjoyed the glorious prospect on every side, the party now prepared for the grand ceremonial of the day: the champagne bottles were produced, and the popping of the corks proved that the cold had not impaired the vigour of the wine, which was drunk with the heartiest good wishes for the health, welfare, and long life of the Sovereign Lady of England; the cheers, as mentioned before, were not so lusty as could have been wished, owing to the difficulty of respiration at such a height. The natives, who had also ascended to the summit, were not forgotten, receiving each a bumper of champagne, which they drank, shouting *La Reyna d'Inglaterra*; and as soon as their cups were drained to the bottom, asked for more. Whether the enthusiasm of the English was catching, or whether they approved of the flavour of the wine, who shall say? Having collected a few specimens from the extreme top, consisting principally of crystals of sulphur, the descent was commenced, and effected with considerable expedition as far as the bottom of the cone, when the snow was once more crossed, and the lava field gained. Diverging to the right, ten minutes' scramble brought the party to the mouth of the celebrated ice cave, into which every one descended by a neat wooden ladder. The cave was small, with three outlets, running apparently into the bowels of the earth; the bottom was covered with solid ice, so that it was impossible to ascertain the depth. From the roof many icicles depended, while some large conical masses of drift snow were piled up in a line with the entrance. The temperature was 33°, but the atmosphere felt much warmer, being completely sheltered from the wind. From this cave the Teneriffians obtain their summer supply of ice, which is said to be inexhaustible; most probably it is a frozen spring.

Starting from the ice cave, the party pushed on to Alta Vista, and in little more than an hour after leaving the summit reached the ruins of Professor Smythe's Observatory. Some dried-up bushes grew in its vicinity, otherwise all was bleak and drear; but about 100 feet below a few peak violets were gathered, and every foot of descent gained the aspect of vegetation improved, while at the commencement of the Pumice Plains shrubs

appeared, and gradually heaths, arbutus, and Portugal laurel closely approaching small trees in size. The plains were reached at half-past eight, and the horses again mounted, this time with joy and thankfulness, for every one was very tired. Pushing on for Orotava, the Estancia de la Sierra was gained at ten, and a short halt called while the muleteers dispatched the débris of the provisions. Having satisfactorily concluded their operations, a final start was made for La Villa, which, being in the direct road to Santa Cruz, is a much better place to call at on the return journey than El Puerto: the carriage, therefore, had been ordered to wait at La Villa.

As mentioned before, the track from El Puerto was bad indeed, but that to La Villa was execrable; it could only be compared to a rut, into which huge pieces of rock had been sprinkled promiscuously; the horses, however, with marvellous sagacity, picked out their way, and kept their legs, so that no accident occurred. It should be remarked that, in general, bits are not used for the horses, but a sharp iron band across the nose does duty instead; it is not nearly so good as a bit for picking up a stumbling horse, because it bends the head down instead of elevating it; but on the whole, it appears to punish less than the heavy torture iron usually forced into the mouths of Spanish horses.

For upwards of two hours the track was of the vilest, but in spite of a powerful sun, was patiently jogged over. At length the party were cheered by signs of cultivation and a better path, and in process of time—namely, nearly two p.m.,—dismounted at the door of the Fonda, in La Villa, thoroughly tired, having been 22 hours scrambling amongst rocks, up hill and down dale, on foot and on horse-back, alternately wetted by the clouds, dried and frozen by the cold, nearly boiled by sulphur cauldrons, and finally stiffened and scorched by fatigue and a broiling sun.

Ablutions and a change of apparel proved somewhat refreshing, and the carriage being ready, the last half of the journey was commenced at 2·30, in the hope of arriving on board by sunset.

The time from La Villa to Santa Cruz may be said to have been spent in constant excitement. The poor boy, whose accident has been recorded above, had been pronounced out of danger; the coachman, therefore, was in the highest spirits, which he kept up to boiling point at each stopping-place, while narrating the boy's safety. As may readily be imagined, he soon became utterly reckless, and drove at full gallop, and, as it would be hard to find better cattle, the carriage flew along, down hill and round the curves, on two wheels. It was all the same, on went the vehicle as if bewitched, keeping its equilibrium by a miracle. When the curves failed, a large rock or other obstacle on the road was selected to drive over, and it was no fault of the driver that all his passengers were not shot out from their seats on more occasions than one. The fellow also amused himself by pointing out a brother coachman who had capsized the English consul. This worthy, on being interrogated at one of the stoppages, narrated the story with the most charming frankness. It appears that the English consul had offended the rascal, who therefore determined to do him to death; seizing, therefore, a favourable opportunity, the unfortunate consul was trundled over a deep curve by his friend the driver, but, *malgré* the odds, escaped with only a few bruises. The carriage rattled through Laguna at a gallop. Jehu would not abate his speed one jot, but, on the contrary, amused himself by shaving a camel, or grazing a house at the corner of a street, or avoiding children at play by a hair's breadth. Taking all the circumstances of the case into consideration, it will not be wondered at that when the driver called out "Here we are!" every one responded "Gracios a Dios!"

Thus ended a very pleasant trip to the Peak of Teneriffe, the more gratifying because the object for which it was undertaken was successfully carried

Tene. iffe, seen from the Sea.

out. The party were, undoubtedly, the *highest* of her Majesty's subjects on her birthday, and from no place, whether in or out of her dominions, did heartier good wishes for health, happiness, and long life emanate than from the summit of the highest "Peak" in the world.

On board the Fury also the occasion was improved to demonstrate the affection and respect universally felt by Englishmen for their Queen. The ship was dressed in mast-head flags, and each man had something—not champagne, however,—with which to drink long life and happiness to her Majesty, while, at noon precisely, a royal salute was fired. The Spanish authorities had been informed that every honour would be paid on the Queen of England's birthday by the man-of-war in the roads; an officer, therefore, was sent off to inquire the exact programme, as his Excellency

the Governor desired to make an equal demonstration on shore. Accordingly, as soon as the first gun was fired, the batteries commenced, and again at sunset, when another royal salute was fired from the ship it was echoed, gun for gun, from the town. The sunset salute was fired by the particular desire of the loyal "Furies"—absence, it is said, makes the heart grow fonder, and the Fury had been absent five years from home.

The number of guns fired in the combined salutes of noon and sunset make up the exact number of years of her Majesty's age—forty-two; may she live, at least, as many years as symbolised by the combined Spanish and English salutes—eighty-four!

At 2 A.M., 26th, the Fury terminated her visit to Santa Cruz, which was, and will continue to be, *couleur de rose* to all connected with it. The last of the glorious Peak was seen more than one hundred miles off, and it finally disappeared with the setting sun. B. Pim, Captain R.N.

CAGLIOSTRO.

The subject of my paper is probably the man of the last century who has most engaged the attention of writers in every branch of literature. In our day Dumas, the unapproachable, has made him the hero of a famous romance, while Carlyle has written many winged words about him. Other authors of lesser calibre have tried their hand with him, and at the first blush it might be supposed that a subject less promising for novelty could hardly have been selected. There is one side of Cagliostro's polygonal life (if I may use the term), however, which has not yet been duly regarded. Of the countless books published about him no two agree on simple facts: his birth, his influence, and even his swindling have been variously described. In this short sketch, in a word, I purpose to tell the truth about the arch impostor whose clumsy juggling makes one feel ashamed of one's ancestors for letting themselves be deluded by such transparent frauds. Frederick Bülau, in his celebrated work "Geheime Geschichten und räthselhafte Menschen," has completely succeeded in analysing the life of the great Copth, and the following details derived from his work, though they may prove disappointing, can be relied on for their accuracy.

Joseph Balsamo was born at Palermo on June 8, 1743, his father being a bankrupt bookseller, with a more than strong suspicion of Judaism about him. At the age of thirteen the lad was sent to the monastery of the Brothers of Mercy at Cartagirone, where he gained the affections of the frater apothecary, from whom he apparently acquired the elementary ideas he possessed on the various branches of medicine, which served him in good stead at a later date. During the lad's stay with the pious fathers, he caused them considerable annoyance, one of his favourite tricks which scandalised them greatly being to substitute the names of brigands and light women for those of the male and feminine saints mentioned in the chapter of the martyrology he had to read during supper. The result was, that Joseph was turned out without a character. On his return to Palermo he appears to have lived by his wits, and he had considerable skill in fencing and drawing. The former accomplishment repeatedly got him into trouble, while the latter he employed to improve himself in forgery. One of the tricks he played is not without its humorous side: he obtained from a jeweller of the name of Murano sixty gold ounces, on a promise to help him in discovering an immense treasure buried in a cavern by the seashore; but when they reached it, the hapless jeweller was attacked by half-a-dozen demons, dressed all in red, who gave him a tremendous thrashing.

For this and similar matters,—which brought him into unpleasant collision with the police,—Balsamo thought it advisable to quit Palermo for a while, and he proceeded to Messina, where he formed the acquaintance of one Altolas—the sage Althotas of his own and Dumas' romances—a clever Spanish or Greek adventurer, who had already travelled over a great portion of the East, and was probably an adroit conjuror. It seems certain that Balsamo made several trips to the Archipelago, Asia Minor, and Egypt, with this Altolas, who initiated him in his various tricks. While wandering about in this way, Balsamo picked up that smattering of Eastern languages which he afterwards employed to dazzle his dupes. At Malta he lived on intimate terms with the Grand Master Pinto,—not, as he says in his Life, because he was a son of a princess of Trebizonde, but as one of the numerous adventurers who profited by the Grand Master's passion for alchymy. At any rate, Balsamo gained such credit with Pinto, that the latter gave him very strong letters of recommendation to Rome and Naples. At Rome especially, Baron de Bretteville, Envoy of the Maltese order to the Holy See, introduced him to the first houses: and at a later date Balsamo used to boast of the peculiar favour in which he stood with Pope Clement XIII. and Cardinal York. In 1770, he married a simple servant girl, Lorenza Feliciani, with whom he fell in love for her great beauty. It is probable that this marriage was only a speculation, and that he hoped to derive profit from his wife's exceeding loveliness. In fact, he never behaved as a severe husband, and most indulgently closed his eyes to any eccentricities on the part of the fair Lorenza, who, in gratitude, was always his most docile instrument.

At this time Balsamo lived by forging letters of credit with two accomplices, Agliata and Nicastro. The latter having denounced him, Balsamo fled with Agliata to Bergamo, where he gave himself out as an officer in the service of the King of Prussia, but the police would not believe him. Whereupon Agliata bolted, taking with him the entire wardrobe of his partners, whom he left in a state of perfect denudation. Balsamo and his wife, in order to get out of the scrape, were obliged to assume a pilgrim's dress, and announced that they were about to undertake a pilgrimage to St. James of Compostella. They next turned up in London, where Lorenza made plenty of money, defrauding a Quaker, among others, of one hundred guineas. As for Balsamo, it appears that during his first stay in London, he was convicted no less than ten times of swindling. The result was that he thought it better to be off to Paris, but the faculty of that city refused him permission

to practise as a physician. Lorenza having left him, he found means to punish her by imprisoning her for several months at Sainte Pélagie. He then made a trip through the Netherlands and Germany, and suddenly reappeared at Palermo with the name of the Marquis de Pellegrini. The vindictive jeweller recognised and had him arrested; but Lorenza contrived to form the acquaintance of an influential prince, who procured her husband's liberation by thrashing the prosecutor's lawyer as a warning example. Being in a state of terrible impecuniosity when liberated, he pledged articles belonging to his sister, and the poor woman was obliged to pay eleven gold *onzas* to redeem them, as Göthe tells us in his "Travels in Italy."

Balsamo then proceeded to Spain, where he travelled in a Prussian uniform, and assumed the name of Dr. Tischio. He made a living by selling a water of beauty, converting hemp into silk, making gold of mercury, melting small diamonds to produce larger stones, but chiefly by predicting lucky numbers in the lottery—a secret he would not have failed to benefit by himself, if he had been completely convinced of its efficiency.

Returning once more to London, he was received there into a Freemasons' Lodge, and from that moment dates the power he exercised so long, and the noise he made in Europe. Henceforth he only moved in the highest circles, leading the life of a prince, and cleverly giving his intrigues a new and more brilliant character. He managed to obtain an extraordinary influence over minds, especially of women and men of weak character. His portrait and that of Lorenza were worn on fans, rings, and medallions, and busts of him in marble and plaster were sold, bearing the inscription *Divo Cagliostro*, which was the only name he thenceforth acknowledged.

Even the worthy Dutchmen yielded, like everybody else, to the torrent. At the Hague all the masonic lodges rivalled each other in the brilliancy of the reception they gave Cagliostro, and in that town he was even compelled to open a ladies' lodge. He invented a new masonic system, which he declared to be Egyptian, and incessantly propagated it, though he did not succeed in having it completely adopted till October, 1784, on the establishment of the grand mother-lodge, "for the triumph of truth," at Lyons. It was said that he obtained the first idea of the system when in London, from a MS. by one George Copston, but he referred it to Enoch and Elijah, from whom the Egyptian high-priests had it. At the outset he only gave himself out as the Messenger of Elijah, or the Great Copth, but at a later date he promoted himself to the rank of Grand Kofi. He then asserted that he was the produce of the loves of an angel with a woman, and was sent into the world to lead the faithful to a higher degree of perfection by a physical and moral regeneration.

It is permissible to say that Cagliostro's partizans adored him; they passed hours kneeling at his feet, and believed that the slightest contact with him sufficed to sanctify them. In the lodges, when that passage in the Psalms was chanted, *Memento, Domine, David et omnis mansuetudinis ejus*, the name of Cagliostro was substituted for that of David. Generally he retained a great part of the organisation and distinctive signs of the ordinary freemasonry, and merely augmented the number of degrees. He also opened lodges for all creeds, especially for the Jews, whom he declared the most honest people on earth. Moreover, he affected religion, combated atheism, and would not permit the saints to be turned into ridicule; hence many persons took him for an agent of the Jesuits, whose monogram he placed everywhere, recommending it to the respect of the faithful. But this affectation was entirely superficial.

On leaving the Hague, Cagliostro spent some time in Venice, and then returned to northern Europe. At Berlin he attracted no sympathy, although he announced to the Prussians that Alexander the Great was still living in Egypt as chief of a band of warrior-Magi, who had gained all his victories for Frederick II. The Prussians, as it appears, would not listen to him, so from Berlin he proceeded to Mittau. In this capital of Courland he operated with considerable success, and for a long time had many fervent and pious adherents belonging to the highest classes. Among these was Eliza von der Recke, who presently recovered her senses and published a very curious book against him. On this new scene Cagliostro pretended that he had been sent by his chiefs to recover, by his magical operations, treasures and documents relating to freemasonry, which had been buried for centuries in the domain of Wilzen. History does not tell us if his efforts were crowned with success.

From Mittau Cagliostro proceeded to St. Petersburg, where he tried to pass as a Spanish colonel, but the ambassador of that country protested against this assumption. Dr. Hugensohn, physician to the empress, also displayed such a determined scepticism, that Cagliostro found it useless to remain in St. Petersburg any longer. He therefore went through Warsaw to Frankfort, and thence to Strasburg, and the brilliant reception offered him in the two latter cities amply requited him for the coldness of the North. He started for Paris in the company of Cardinal de Rohan, but returned to Strasburg in 1781. The physicians who, like the priests, were ever his determined foes, opposed him so zealously that he thought it better to start at full speed for Naples, under the excuse that he was summoned by a dying friend. In November, 1782, he arrived at Bordeaux, as he said, on the invitation of the Minister de Vergenes, and remained in France till he was implicated in the famous trial about the Queen's necklace. It is not at all probable that he took the slightest part in Madame de Lamotte's swindling, for he had at his disposal very different means to plunder the Cardinal, and was the man to defend his protector sooner than let him be fleeced by others. It is believed, indeed, that Madame de Lamotte merely implicated him on the trial, because, when the affair became blown, he advised the Cardinal to tell the truth. In this investigation nothing affecting Cagliostro came out, except that on the day when the Cardinal was arrested he had invited the latter to sup in the company of Henri IV., Voltaire, and Rousseau. There was evidently some imposture in this, but it had no connection with the necklace affair. Still, from the beginning of the trial, he was

placed in the Bastille, after he had refused the means of flight offered him, and the sentence, passed on May 8, 1786, condemned him to be banished from France. During the trial his adherents sent to Parliament an apology for him, splendidly printed and adorned with the portrait of Cagliostro—a memoir, in drawing up which Espremenil himself had a share, and which was presented to the judges by men of the highest rank. It states, "That Cagliostro is the son of a Grand Master of Malta; that he was mysteriously educated at Mecca and Medina; after journeys undertaken in his earliest youth, he was initiated in the secret sciences of the East in the Pyramids of Egypt; his instructor, the sage Althotas, to whom he owed all he knew, was a Christian and Knight of Malta, but was accustomed to wear and make his pupil wear the Mussulman costume; that on reaching the full maturity of his intellect and genius Cagliostro began traversing Europe as a physician and prophet; endowed with the power of raising the dead and exorcising spirits, he had everywhere shown himself the 'friend of humanity,' a title which public gratitude had justly conferred on him." It makes one ashamed of humanity to think that there were men, not more than eighty years back, who believed in such absurdities.

When Cagliostro was restored to liberty, his adherents illuminated their houses, and celebrated his acquittal by magnificent fêtes. A number of distinguished men accompanied him to St. Dénis: and when he embarked at Boulogne, thousands of persons lined the shore, and asked his blessing.

He went across to England, and at once published a pamphlet, in which he accused the governor of the Bastille, the Marquis de Launay, and the Chevalier Chenon, of having robbed him of his most valuable articles. Fortunately for them, these gentlemen were enabled to prove in the most positive manner the falsehood of this accusation. Cagliostro also produced a Manifesto to the French Nation, dated February 20, 1786, in which he produced, under the form of prophecies, the very natural wishes of a man who has just left the Bastille; for instance, the destruction of that state prison, and the abolition of *lettres de cachet*. The publication of this Manifesto furnished him at a later date with an excuse for addressing the National Assembly from Rome, and asking permission to return to France, in consideration of the signal services he had rendered to the cause of liberty.

It appears that during his stay in London, after his escape from the Bastille, he formed a connection with a fanatic of a very different stamp—Lord George Gordon, with whom "Barnaby Rudge" has made us all so thoroughly acquainted. It is a curious fact, when we remember Cagliostro's liking for Judaism, that Lord Gordon became a Hebrew in his later years. At the same period, Cagliostro also entered into relations with the Theological Society of the Swedenborgians. *Per contrà*, he found a rude adversary in Morand, the editor of the "Courrier de l'Europe," who so pursued him with his biting sarcasms, while proving the truth of his statements, that the great Kofi could not prolong his stay in England. In Germany he had lost all credit, through the frankness with which Eliza von der Recke revealed Cagliostro's nullity and her own weakness; and also, it must be conceded, through the false charge brought against him at Berlin, of being an agent of the Jesuits.

One illusion is, in truth, more easily destroyed by another illusion, than by the simple truth. Still Cagliostro succeeded in establishing a mother-lodge of Freemasons for Switzerland at Basle; but at Biel, the local authorities took umbrage at his performances, and his wife was obliged to declare on oath, in the presence of the magistrates, that her husband had always lived as an honest man and good Catholic; and the information collected by the authorities was, consequently, false. At Turin, the Sardinian government ordered him to leave the kingdom immediately: Joseph II. had him driven out of Roveredo, and that prince also had him expelled from Trent, where he had contrived to gain the good will of the archbishop by affecting a deep penitence and going frequently to mass. He proceeded thence to Rome, where his adventurous career was destined to end. His possible object was to employ, in his fashion, certain letters of recommendation given him by the archbishop, or he may have merely yielded to the entreaties of his wife, who wished to see her parents again. He lived there at first in great seclusion: but presently, impelled by necessity, as he declared, he crept into the Masonic body "for the meeting of sincere brethren," and tried to propagate there the ideas of Egyptian Freemasonry. He must have felt, however, that the ground trembled under his feet, for he drew up an address to all the Roman lodges, urging them to liberate him, in the event of his being arrested, and, if necessary, to force the prison. Still it does not appear that he destroyed any of his papers, for an immense quantity was found at his lodgings. Betrayed by one of his adepts, he was arrested and taken to the Castle of St. Angelo, on November 27, 1789.

The Roman Inquisition carried on his trial with a patience and moderation that was not to be expected from such a tribunal, and gave it a laudable publicity. But, in conformity with its instructions, it paid less attention to Cagliostro's trickery and schemes, than to his religious opinions. He at length confessed his irreligious principles and heresies: whereupon he was condemned to death. In 1791, Pius VI. commuted that sentence to imprisonment for life, and if he evinced a sincere repentance, the ecclesiastical penalties and censure would be remitted. Lorenza was shut up in a convent. It has been asserted that Cagliostro tried one day to strangle his confessor, in order to escape in his gown, and that in 1797, on the approach of the French troops, he was found dead in his cell, a victim to the Inquisition: but these reports seem to be false. His time had passed by: besides, he never had any great political importance, and even what he had was of no value, since politics had passed from the hands of intriguers into those of revolutionists and violent men.

Cagliostro's person is described by some as repulsive, and even disgusting, while others judge it more favourably. He was of short stature, and

of a brownish tint, as became a Sicilian; but at a later date he became very stout, without counting that he squinted. But, for all that, he had a splendid head, which might have served an artist as a model to represent the poet under the power of inspiration. His language was not free from the idioms of the Sicilian dialect: his tone, his features, and his manners were those of a pompous, presumptuous, and troublesome charlatan, and usually people ended by recognising him as such. It is said that his conversation in private circles was rather agreeable. His wife declared that the speeches he pronounced, sword in hand, were a gallimaufry of high-sounding and ridiculous tirades. But it is possible that she could not understand him; and besides, she found a way of purifying herself, when the crash came, by blackening her husband as much as she could.

The financial resources he had at his disposal, or really employed, were at various periods so extraordinary, that it is impossible to discover how he procured the money. When he travelled, his suite was always composed of six Berlines, each drawn by four horses. Following the usual tactics of medical charlatans, he sent in no bill to his patients, and claimed no fees from them: he merely accepted from their gratitude presents, or loans. It is said that he spared neither trouble nor care with his patients: and if some cases may be mentioned in which he was not successful, it is indubitable that he performed a great number of extraordinary cures. He distributed all his medicaments *gratis*, and he only demanded a small fee for his pills, through a chemist in his service. His pretended Egyptian wine was a powerfully spiced and stimulating beverage; while lettuce, and other plants of the same nature, were the components of his "refreshing powder." He also employed *arum maculatum*, a very poisonous material, and large doses of sugar of lead for external use.*

LASCELLES WRAXALL.

A RUN FOR LIFE.—A RAILROAD ADVENTURE.

MY business frequently leads me out of town, and as time is an object to me, I have got into a habit of travelling by the night mail trains.

Usually, I arrange myself for sleep immediately on entering the carriage, and long practice at dozing under difficulties permits me to calculate with tolerable certainty upon a good night's rest on my journey; but, occasionally, the presence of a more than commonly agreeable companion will tempt me from my custom and lead to a night vigil spent in pleasant talk. These indulgences are however rare, for I cannot afford to incur the weariness which follows on want of sleep very often, and I have therefore grown discriminating in my choice of the man or conversation which I count worthy to have the honour of my wakefulness. On the last occasion when I thus yielded to the temptation the circumstances were somewhat peculiar, and the story to which I listened so strange, that I propose to repeat it here for the reader's benefit. In doing this I can scarcely hope the narrative will make the same impression upon him it did on me, since I cannot surround it with the actual incidents of the night in question which lent it peculiar fascination; still I believe, that even without the accompaniments of darkness and possible danger, it will prove to possess considerable interest of its own:

I took my seat one wild wet and wretched evening during this late winter, in a first-class carriage of the mail train leaving a London terminus for the north. No other passenger besides myself occupied the compartment, and I was soon wrapped up comfortably warm and meditating a snooze, when the train started.

The whistle sounded, the blurred images of the station lights began to move slowly past the windows, and we were fairly off.

In a few minutes I was sound asleep, and an hour or two of perfect forgetfulness must have ensued, when I was suddenly wakened by a shock which sent me flying, a confused mass of humanity and wrappers, into the arms of an opposite passenger whom I then saw for the first time, and who had probably entered the carriage at one of the intermediate stations from town without disturbing my slumbers. For a few moments the violence of the blow, together with the confusion of ideas consequent on being newly wakened out of a sound sleep, left me in a very nervous condition; but on presently observing that the train had come to a standstill, I became somewhat calmer, and listened with tolerable composure to the quieting assurances of my companion.

"It is a mere nothing," he remarked, "probably a break down of some goods' train before us. Suppose we get out and hear all about it."

We left the carriage, and soon discovered the cause of the mishap, which was but slight. Just as my new friend supposed; a luggage-engine had broken down on the line, and had sent back her guard to warn us of the fact. Our driver had seen the signals, but had not been able quite to pull up before reaching the luggage vans, hence we had run into the hindmost of them at a speed of from three to four miles an hour. Slow as this rate appears, it was sufficient to pitch me, as I have described, right into my neighbour's arms, and in my half-sleeping state seriously to alarm me. Half an hour's delay put everything straight again; the goods' engine was patched up, and we resumed our seats, glad enough that matters were no worse, and not at all sorry to escape from the damp and bitter air outside.

This slight contretemps led the way naturally to a general conversation on accidents, in the course of which I found that Mr. Berkeley (for such I learnt was my companion's name), was well acquainted with railway matters, in which he appeared to have had considerable experience. I had been not a little surprised at the violence of the shock which was communicated to our train by a collision at so low a speed as four miles an hour, and on my expressing this feeling he said:

"You are quite right, no one would believe until he has actually felt it how apparently tremendous a blow can be given by a train moving so slowly, and I am quite sure it would be impossible

* Those who wish to know more of this arch impostor can consult "Compendio della Vita e delle gesto di Giuseppe Balsamo, denominato el Conte Cagliostro" (Rome, 1791); Göthe's "Reisen in Italien;" and the "Memoirs of Baron Henry Von Gleichen" (Leipzig, 1847).

to convey the least idea of the effects produced by collisions at high rates of speed."

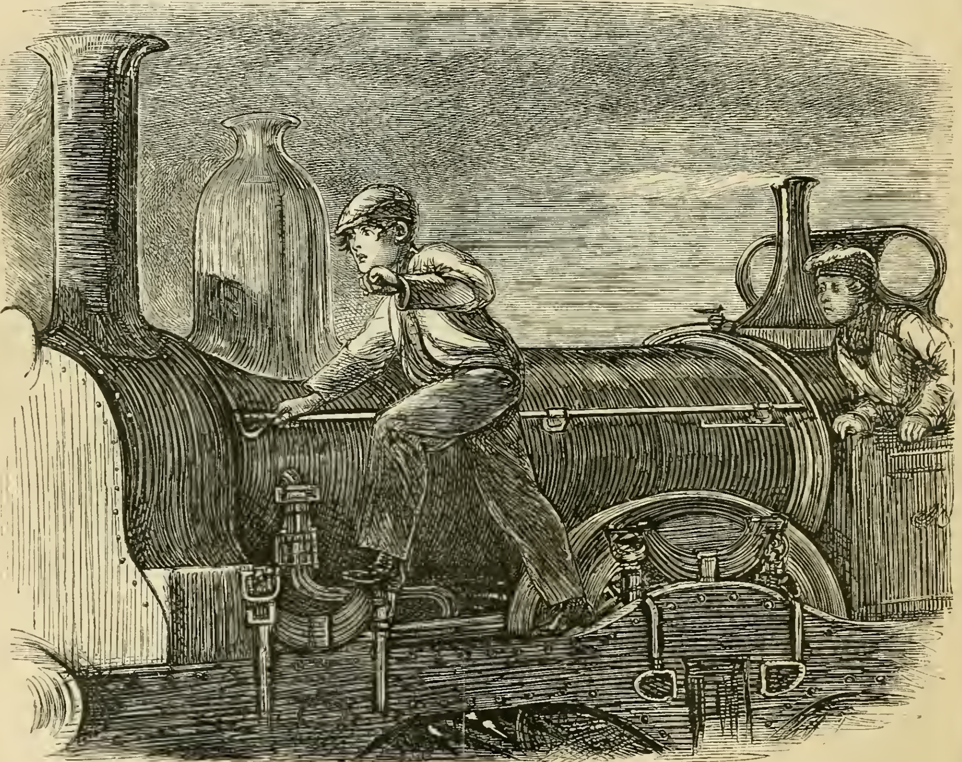
I inquired had he ever been in any accident of the kind, and he replied:

"Once; but the disaster was of a somewhat unusual character; if you feel indisposed to renew your nap perhaps you might like to hear the story."

Further sleep was out of the question and I begged him to proceed, when he forthwith told me the following facts.

"I must premise then," he began, "that though now a tolerably prosperous and well-to-do person, I did not always occupy my present position. At this moment I am one of the directors of the railway on which we are travelling, but I commenced life considerably lower down the social ladder. My father was an extremely clever and capable artizan, who possessed besides ability, considerable prudence and no small share of ambition.

"With such qualities it was only natural that he should rise in life; and he did so. Before I was sixteen years of age he held a lucrative and responsible position in the locomotive department on one of the great north country lines, and had he lived I think he might have made himself a name in the world. I was his only son, and he gave me a good education, deeply tinged with a mechanical colouring, in the hope that I should improve on his success. In this hope, if he were alive, he would not, perhaps, be altogether disappointed; but, although I have no reason to complain of want of present prosperity and social



position, it is none the less true that the spare hours and holidays of my school life were spent chiefly among workshops, mechanics, and engine-drivers. In those young days I had a passion for the locomotive, and my boyish ambition was to become a master of all the mysteries and duties connected therewith. Thus I was for ever loafing about the engine-house and getting an occasional trip with good-natured drivers more ready to please an inquiring youngster than careful to obey the company's regulations. In this way I early gained a tolerably complete insight into the management of the locomotive, and being a shrewd self confident lad, soon acquired a profound belief in my capacity for discharging all the duties of a driver. I had, besides, an inseparable companion named Mark Hibberd, whose father followed the calling I thought I should so much adorn, and who delighted equally with me in pottering about among the engines and men, or riding short distances whenever the opportunity occurred. The elder Hibberd was an extremely daring and clever driver, a first-rate workman; but unfortunately like too many of our very best artizans, given to occasional fits of drunkenness. This peculiarity had got him into trouble once or twice before the time of which I am speaking, but as on each occasion his escapades had been productive of no actual harm, and he was in other respects a very valuable man, he was retained but cautioned. Mark was quite as great a proficient as myself in knowledge of the craft, and the dearest wish of both was to

have our abilities properly recognised among the workmen who were our companions. In all our little enterprises and adventures Mark, however, was the leader, he inherited his father's skill and courage, and soon acquired even among the men a good reputation for steady pluck and shrewdness. Such were young Hibberd and myself at about the age of fifteen; but in order that you may clearly understand the whole of my story it will be necessary for me now to explain the situation and peculiarities of our station and the neighbouring line. Coulston is a large town on the —— railway, standing mid-way between Allonby, which is ten miles below, and Castleton, which is ten miles above it.

"Attached to the station are the locomotive works already mentioned, and a very large engine-house. In the latter, the number of engines was generally considerable, and this was our favourite haunt where we lurked at all hours, hoping for the chance of a run with some complaisant comrade down to Allonby, whence we trusted to the chapter of accidents and 'Shanks his mare,' for a return journey. The engine-house stood at a distance of about 200 yards below Coulston station, with which it was connected by a siding joining the main line, in a manner with which everyone is familiar.

"Allonby was a small place where few trains stopped, while our town was large and of rising importance. The nearest down station of any size was Lichester, about forty miles distant. It happened one dark but clear November evening, that Mark Hibberd and I were lounging about our favourite engine-house chatting to one and another of the drivers who were busy oiling and cleaning their respective locomotives. Old Hibberd's 'Firefly,' was there with steam up, an order having come during the afternoon that Mark's father was to be in readiness to take a 'special' down to Lichester at eight o'clock precisely. Hibberd himself was not there, though it was then half-past seven, and Mark said casually, in answer to a question from old Bob Jacobs, his fireman, that he hoped his father was not 'on the lush,' but he had been down to the Railway Arms again that afternoon for the first time during the last three months.

"We were standing on the footplate as we talked, and steam having been up some time and the water in the boiler somewhat low, I said to Jacobs, 'Bob, you'll have to run her down to the crossing and back a time or two to fill up the boiler,' it being necessary, I must tell you, to put an engine in motion before the pumps which feed her with water can work.

"'Right you are, Mas'r Charley,' said Bob; 'but do you and Mas'r Mark take her down to the points and back agin while I light my lamps and fill my oil can.'

"Here was one of the little chances we delighted in. It wanted exactly twenty minutes to eight when Mark turned on steam, and we glided slowly out of the engine-house, leaving old Jacobs trimming the 'Firefly's' lamps. We had run backwards and forwards over the hundred yards of rails between the crossing and the house when Mark's evil genius prompted him to exclaim:

"'I say, Charley, let's run over the points and down the line for half-a-mile or so; we can be back easy by eight o'clock.'

"No sooner said than done. When we reached the points I dropped off and opened the switches, thus shunting the engine on to the up-line, upon which we proposed to indulge ourselves in some two or three minutes' galop, and then return.

"Now in acting thus, you must understand that we did nothing whatever involving any danger from ordinary sources, and were in all human probability perfectly safe from mishap.

"The next train was an up express, not due at Coulston till 8·20, but which did not stop at Allonby. Nothing could possibly follow us from behind for we were on the *up* line of rails, and as we should be back again before eight o'clock, there was of course no danger to be apprehended from the coming train. Hibberd, on our return, had only to ship his lamps and start on the down line for Lichester.

"Our programme, however, was deranged in a way we little expected. Prudent if bold, we did not allow the delights of our galop to detain us too long, and it wanted some minutes to eight when we passed the crossing on our way back to the engine-house; we had slackened speed on approaching the points, and were travelling slowly and quietly when Mark shouted to me, 'Put down the break, Charley, here's the big "Swallow" coming out at a lick, and no mistake!' In a moment we had stopped and reversed the 'Firefly,' and began to move slowly a-head down the up-line again, greatly wondering what it all might mean, but not in the least alarmed for our safety, since we had only to allow the 'Swallow' gradually to overtake us, and when she saw us (which, as we had no lamps was not so easy) both engines might return together. Meanwhile the giant behind us came on at such a rapidly increasing speed that we were unwillingly obliged to travel faster as well. We shouted and tried to attract attention from her driver, but in vain, and we presently began to think that something must be wrong. At length Mark whispered, 'Charley, you may take my word for it that's the governor, and he's mad drunk. Like enough he's got on the first engine that came to hand, and don't know at this moment if he's on the up or down line or what he's doing—he's the very devil after he's been drinking.' Here was a pleasant situation.

"It was just on the stroke of eight o'clock; in another ten minutes at farthest the up express would pass Allonby on its way to Coulston; before us therefore was the certainty of collision, and behind us an engine already running at a great rate which increased with every minute, and driven by a man mad drunk—what was to be done? It was a case in which moments are precious, and decision must be the work of a second of time.

"'Let us run for Allonby,' said Mark, at once, with his hand upon the regulator. 'Keep the whistle open all the way, and trust in Providence they'll hear it and have time and sense to shunt us on to the "down" before the express runs through.'

"I was for less vigorous measures. Something assured me that Mark was right, and that the engine behind us was driven by Hibberd in a state of intoxication; but I fancied that however drunk he might be, he would yet not be so utterly insane as to persist in rushing against certain destruction, provided we could make him understand his danger; so I proposed that we should slacken and let him overtake us, then climb upon the 'Swallow,' and by persuasion or force induce him to return. All this and much more passed between us in far fewer seconds than I take minutes to tell it you; in fact, the whole affair was a succession of such rapid action following upon decisions so swift that I find it impossible to give you the faintest idea of the startling suddenness with which the circumstances crowded on each other. For a moment Mark—thinking doubtless more of his father than himself—approved of my suggestion, and we slackened speed. By this time both engines were running at a perfectly frightful velocity, and the 'Swallow' almost instantly overhauled us. No sooner did her buffers touch ours than Mark flung himself upon his father's engine. I watched him clamber along the boiler till I lost the outline of his figure in the darkness. A minute of unspeakable suspense followed, during which the 'Swallow' held on her rapid speed. I now did all I could to impede her progress. I shut off steam and screwed my breaks down till they were one sheet of flame, but still the hinder engine drove me forward. At length, after what seemed a whole hour to me, I heard above the din of the open whistle a succession of yells, mingled with hoarse curses. I closed the handle a moment to listen, and soon felt certain that a fearful struggle was going on between Hibberd and his son. I caught at the 'Swallow,' pulled myself on to her, and climbed as fast as I could towards the footplate. Half-way along the boiler I met Mark returning reckless.

"'On to your engine,' he screamed, 'and run for Allonby.'

"This was enough for me; it was no time to ask or answer questions, and another second or two saw us both upon the 'Firefly'—breaks up, whistle open, and all steam on. We drew quickly away from our companion; but the few minutes of delay had frightfully diminished our chances of safety.

"It was so dark that I could not clearly see Mark's face, but I knew from the disturbed appearance of his clothes there had been a tussle, and I said simply, 'Well, Mark?' While speaking, I opened the fire-door, and as the red gleam burst out I started in renewed horror, for his whole face, neck, and hands were covered with blood.

"'It's my own, Charley,' he whispered; and even while he spoke, with the certainty of an awful death before him, the noble fellow's eyes filled as he added, 'God help my poor father! he's seen his last drunken spree this night.'

"In hurried words he told me that on reaching the foot-plate of the engine he found Hibberd alone, and raging drunk: that he had made an effort to reverse the 'Swallow's' gear, and in order to do so put his hand upon the starting lever. This fairly maddened Hibberd, who flew upon him before he could accomplish his object and commenced the brief but deadly struggle I had heard. Mark was powerless in his father's strong hands, and escaped almost by a miracle from being dashed off on to the line by a blow which felled him. In the fall his head was cut open against some of the iron work, and he was forced to return as I have described without gaining his end. But no kind of danger made the brave lad blench, and his eyes darkened and his teeth set as, with hand upon the whistle, he strained forward for a glimpse of Allonby signals. As for me, I grew sick; I took out my watch for what I feared was the last time, glanced at the hands, and then sat down upon the tool-box, covered my face, and wept bitter tears as I thought of the father at home who was so proud of me, and the mother whom I loved so dearly. A touch of Mark's roused me. I looked at the dial again, but could not read the figures: he took the watch from my hand, and his voice was quite steady as he said:

"'Another two minutes for us, Charley, and there are Allonby signals.'

"We had been travelling only eight minutes since we first knew our danger, but what an age it seemed! I remember he was handing me back the watch when his hand touched mine, and I felt him start as if shot. The next instant he clasped me tight by the wrist, and whispered in my ear, 'The red lamps! It's all over. God save my poor father.' Again, though he spoke out strong and clear, 'Hold tight to me, Charley, and when I say the word, jump for your life.' We stood a moment poising ourselves upon the oscillating engine, then he shouted 'Now!' and sprang. I was nervous, my foot slipped, and I fell along the foot-plate of the engine. In an instant there was a horrible grinding crash, a dazzling flash of light before my eyes, a huge heave upwards and onwards, then blackness of darkness and insensibility.

"Six weeks afterwards I was sufficiently recovered from fever—brought on by my injuries and the excitement of that night—to hear the sequel of the story. Beyond a broken leg and rib I had escaped unhurt. Violent inflammation, accompanied by delirium, had, however, greatly retarded my convalescence.

"Hibberd and Mark were both dead. The former was greatly cut about, but the latter exhibited no visible injury beyond a comparatively trifling wound in the head. serious it is true, but not sufficient to have caused his death. He died from internal hœmorrhage, and none but myself knew that the scalp wound had been the work of the lad's own father. Concerning the great accident to the night express on the —— line at Allonby station in 184—, I daresay you remember the newspaper accounts: to-night I have tried to give you a true and faithful history of the causes which produced that disaster, and of which a necessarily vague and incorrect version passed current with the public."

And so ended the story of my travelling companion. D. P.

LILIAN'S PERPLEXITIES

A TALE IN TWELVE CHAPTERS.

CHAPTER III. THE IDOL TOPPLES.

RUMBLING alone in the *rotonde*, the landscape hidden in a white fog of dust, there was no occupation for Charles Westby but thought. And at the outset it was satisfactory enough for him to think, because conscience told him he had acted well. In a moment of peril an avowal of love had escaped from a young girl's lips. It had caused great embarrassment to him,—love and marriage were so wholly out of his province that he had never once so much as thought of love in his intercourse with Lilian. There ought to be no equivocation in the matter; it was right she should know at once, and clearly, the state of his feelings and position. Nothing could be more annoying than that she should continue to cherish any absurd ideas. As soon as possible, though with a trepidation he could scarcely conceal, he had resolutely addressed her on the subject. The result had proved the wisdom of his course,—it had appeared from her own confession that she must have talked quite unconsciously on the mountain, and she had, moreover, positively appealed to him not to hold her to her random words; and so there was a good ending to a ridiculous affair.

Not a bit of it! The legal mind then came into action, and he must needs doubt and question which of Lilian's two contradictory declarations was the right one. The more he sifted the matter the more his opinion turned to a belief that words uttered at a period of danger were more likely to be true than words which maidenly modesty would speak in a quiet interview,—cold words, which his own manner might have evoked. Ay, even the slightest evidence must be brought to bear on this important question. Had not Fred Temple told him that Lilian, starting in her fitful sleep after the accident, had constantly called to Karlo

Magno to save her? Surely this went to prove a strong animus in the affair. Thus, after duly weighing the whole matter, Charles Westby came to the conclusion that Lilian Temple had really loved him. And then it came to pass that pride grew mightily flattered with the idea, and toyed with it all the way till the diligence stopped at Berne.

A grand sunset ended the day. Ah, me! many were the diners at the Faucon, and they hurried up from the scarcely finished table-d'hôte—stout diners and all—martyrs to the picturesque, scorners of indigestion, and so out on the church terrace, to see the mantle wrought in a glorious hue, which the departing sun had cast upon the mountain-tops. But Charles Westby only cared to seek out the rosy Jungfrau, and use it as a landmark to Interlachen and the human interest that it held.

Charles Westby was getting stupid!

Stars burnt with double fire, over the *banquette*, that night long in the ride to Basle; and the sun, beginning to stir beneath the horizon, felt its way with long pink rays thrust upwards into the darkness, and then slowly climbed the heavens on glowing red cloud-steps. It was neither Law nor Equity which closed these sights from Charles Westby's eyes.

"*Est-il possible?*" he exclaimed, thrusting his face into the little glass of a little room in the great hotel at Basle. Dust of a day and night journey was on his face, he was absurdly like a miller. Then head and face were plunged into the little basin, the little towel was half rubbed away with energy, and he brushed his hair double-handed till his strong arms began to glow.

"*Est-il possible?*" and the looking-glass showed dashes of grey among the dark hair, and his face, homely English at best, was hacked about with work and thought, and parchment-coloured, notwithstanding all the clear Swiss air.

"*Est-il possible?*" this outward man against the best men she has seen in London!

Then duty began to look mean in contrast with blue eyes and golden hair. Alas! for the foolish pass to which wise and solid men are brought. Old ambition grew pale before this new fascination. Why not space and time for enjoyment of the heart? Why constant labour with the chance of scanty laurels for thin grey hair? *Cui bono*, these after riches? Can we play Romeo with crowsfeet, and wrinkles, and a wig? So in that upper chamber Charles Westby ground his teeth at destiny, and, gazing fixedly on the swift green Rhine below, fell into strange new musings touching the affairs of life.

Fiddlesticks! destiny puts us into the groove, and for all our bluster we must stick there. Habit and association soon brought back Charles Westby's alacrity for his accustomed work, and Lilian's image was blurred by professional thoughts that held his mind; besides, he was of the energetic order, looking forward not back, and thus he came to a sort of grim settlement of the matter. Long before he would be rich enough to marry, Lilian Temple would have married, and had a family grown up perhaps; he might never chance to meet her again, but that little Swiss tour would remain the romantic idea of his life. All men, densely practical men even, who in the end marry their cooks, have had some sort of romance in the course of their lives of which the world never dreams, and oftentimes have held some token of the fact to their dying day. Well, back in London, Charles Westby, in process of disgorging his travelling coat pocket, found the handkerchief Lilian had dropped during the accident. It was torn, and parts lost, but the initials L. T. were preserved. He carefully folded it up in a piece of brief paper, endorsed with the year and date of the event, and tying the packet with red tape, placed it in his desk, beneath a mass of law papers.

* * * * *

"Well, Newton, and what are you to get for your money?" inquired Charles Westby.

"Ten per cent!"

"Too much! you'll get nothing."

Newton (George Newton, Esquire, of Burford House) was an old friend of Westby, and the young squire of his late father's parish. Their friendship dated from Westby's bird's-nesting period, and it had held on, notwithstanding the divergence in their modes of life, and notwithstanding the soft bits of Newton's character, which regularly provoked Westby's chaff. Newton always made a point of seeking out Westby in his occasional visits to London, and of being attentive in game presents and the like to Westby's mother in the country.

"You are always against anything but three per cents, Westby."

"I tell you what, Newton. Nature gifted you with all the organs necessary to a country gentleman, but she never intended you to dabble in joint-stock bank shares."

"Bosh!"

"We can't be good at everything. Be content with what nature's done; she's made you a good rider across country, a decent shot, a sufficient lawyer to convict a poacher;—by the bye, were you lucky with the pheasants this season?"

"First rate! Come and have a touch at them."

"I only wish I could, old fellow."

"But I say, Westby, it's as safe as the bank, that ten per cent."

"If that's your fixed opinion, Mr. George Newton, permit me to remark that I am happily too busy for fruitless conversation——"

"I'm off then! Mind you, seven for dinner at the club."

"Say half-past; they are bothering me so to get this business finished. Good bye!" And Westby doubled himself to his work again.

"By Jove!" exclaimed Newton, lingering in the room. "Where did you get that engraving from?"

"What engraving?" replied Westby, greatly bored. "I thought you'd gone!"

"This engraving of a girl—the Honourable Mary Blackburn."

"Wretched man! to bother me about stupid prints. I bought a lot of them cheap years ago."

"I wonder if I can get one in the Burlington Arcade?"

"George Newton, if you stop another moment in this room, I'll postpone the dinner to nine o'clock!"

* * * * *

Punctually at half-past seven, Westby rendered himself at the club, but it was past eight before Newton made his appearance.

"Pitch into me well for keeping you waiting, Charles."

"I'll do that to the dinner!" grumbled Westby. "But how on earth is it you lazy men are never exact?"

"Lazy, indeed! I've been half over London since I saw you."

"What for?"

"To get a copy of that engraving."

"Bless my soul! I wish I'd given you mine, I should have gained half an hour by the gift."

"They were all sold out——"

"George Newton, take notice I've had no luncheon, and help the soup."

"I saw a girl the very image of that engraving yesterday."

"Did you? Impulsive youth! How good this sherry is!"

"Somehow I can't get that face out of my head, Westby."

"The subject is beginning to be a bore, George. Their *tartare* sauce is always capital here."

"You'll promise to give me that engraving, old boy?"

"Bless the man! I thought I'd promised it five minutes ago—what's her name?"

"I could not find out, but I know something of the people she was with."

"After all, what's in a name? Here, I'll devote a bumper of this pleasant Moselle to the happiness of George Newton and the fair unknown!"

* * * * *

"What shall we do, Westby? It's too late for 'half-price!' Will you have a quiet cigar in the smoking-room? I know you have given up billiards."

"Let's drift down the Strand to my chambers, and have a rude pipe and some self-made coffee."

* * * * *

Westby lighted his lamp, and addressed himself to the coffee-pot. Newton eagerly took down the engraving from the dark corner of the room in which it had hung, and cleaned the glass with some blotting-paper.

"Tell us what she's like," said Westby, very busy at reviving the fire. "Large dark eyes, and chesnut hair, and that sort of thing?"

"Just the contrary, light hair and complexion, blue eyes."

"And the features?"

"Hang it! I'm so bad at description—I should call it one of your tantalising faces."

Westby started up, and gazed earnestly on the engraving, holding it to the full light of the lamp.

"What's her name?"

"I told you I could not find out."

"Not, not——?" muttered Westby, and he suddenly held his voice.

"Who were you going to say?"

"You can't have that engraving, Newton; I did not recollect at the time which you had asked for."

"Why, I should prize it so much; I'll give you any large engraving you would like to have."

"I don't want engravings!"

"But, I say, old fellow, you did promise it me."

"There, then, take it! take it!" replied Westby, ramming a great wedge of tobacco into his pipe.

George Newton was very fluent—he was always very fluent after goodly "'34"—nor did he speak as he was wont of horses and dogs, but with great confidence of his plans of life; in fact, he did all the talking, while Westby hid his face in big clouds of smoke.

"By Jove, Westby! I'm sick of this bachelor-sort of life; and, by Jove! I've been wanting a nice girl to look after that big house of mine—I get done right and left. I fancy I could make a woman comfortable. I should not mind a couple of months or so of London during the season. Confound it! my tin is worth any woman's while."

And, ringing changes on these ideas, Newton rattled away, till he ended the chime by inquiring,—

"Why, on earth, Westby had not married all this time?"

"Because I can't!" growled Westby, behind his cloud. "It's past two, Newton, and I must turn you out."

Newton carefully placed the portrait under his great-coat.

"Thank you again, old boy!"

But Westby made no reply beyond a grasp of the hand; and standing on the landing he lighted Newton to the door. Bang went the door, and Westby returned to his room with a shiver that caused him to stir the fire violently.

"Confound the fellow!" he muttered, "that engraving is the very image of Lilian. Fool and ass! it's been hanging here all this time, and I never chanced to look at it! Ten to one, but Lilian is the girl he's been struck with; blockhead as he is, with his money he's like enough to marry her."

And Westby filled his pipe again, and puffed more smoke clouds, and the romantic idea surged up from the depths of his heart, and moved to and fro with old teeth-grinding at destiny. Nevertheless, next morning by eight o'clock, Westby was hard and fast, with undivided mind, on that knotty conveyancing matter which strewed his table with dusty parchments.

CHAPTER IV. "AS MAD AS A MARCH HARE."

"One second, Salisbury!" said Charles Westby, in his proper turn at the pigeon-hole, Waterloo station.

It was a quarter to eight on a dismally cold, damp, foggy, early March morning.

The passengers in Westby's carriage consisted of a good-natured burly person of the agricultural cattle-dealing type, armed against the raw morning with a "pocket-pistol," a surly person of the type

aforesaid, a woman with a parti-coloured face, the result of cold and sorrow, and a lean, hungry man with long pale face, restive eyes, and a nose acutely accented with cold.

Whistle! puff! puff! The fog was transparent to the distance of about fifty yards either side of the windows, discovering a limited roof-view of Lambeth, damp through to the rafters. But, clear of London, the fog changed to cold, white mist, which the sun gradually broke into masses of pearl light, and the east wind blew away in wreaths that caught awhile in hedgerows and low woodlands, till at last sun and east wind together made the whole landscape clear and bright to the horizon.

During the latter part of February one topic had warmed London through and through—the smash of the Anglian Bank. Such mercantile depravity! Why, the very thought of it circulated the blood to the tips of your fingers; consequently, no matter afforded conversation more comfortable for a cold morning.

Conversation commenced thus: good-natured agriculturist to surly ditto:

"Zalisbury Market?"

"Hum!"

"Know Jack Sprot?"

"Hum!"

"Done up!"

"Hum!"

"That bank did it!"

"Hum!"

"Beg your pardon!" exclaimed the lean man, breaking into the conversation; "depositor or shareholder?"

"Depositor, I think."

"Shareholder!" grunted the surly man.

"So he is!" cried the lean man, consulting a list in a newspaper. 'James Sprot, farmer.' Not one shall escape!" he added, his eyes gleaming fiercely.

"Oh, Smithers! it's carnal to talk so," sobbed the woman.

"I say not one shall escape!" retorted the lean man, savage with his wife's rebuke. "Look'ee here, gentlemen, last week I'd a snug little shop doing a brisk trade in coals."

"And the green line!" cried the woman.

"And milk!" added the man, his eyes growing still fiercer.

"Wood and eggs!" sobbed the woman.

"I'd put in a new shop-front!"

"And Smithers used to preach at the Duck Chapel, and they'd come to me, this 'ooman' and that 'ooman,' it was so blessed to hear the pure gospel, and one would buy an egg, and another a 'ha'porth' of milk—it all helped."

And the woman's voice sunk in a flood of tears.

"Have a drop of 'summut,' mother," said the good-natured agriculturist passing the "pocket-pistol."

"I'd have them all punished, I would, directors and shareholders and all!" thundered the lean man, after taking the "pistol" from his wife, and indulging in a long sip.

"And what did you lose by the bank?" inquired Westby.

"Oh, sir! all our credit," said the woman, gradually reviving.

"But your balance?"

"It was our credit we cared for!" exclaimed the man, bridling up.

"Why, sir, what with that shop-front and all, they'd been accommodating us a little. I will speak out, Smithers!"

"I feared you'd lost a deal of money," said the good-natured agriculturist, laughing.

"So I have, sir!" retorted the lean man, firing up. "Credit is money—every child knows that."

And the lean man, being touched to the quick, proved with that fervid eloquence which had excited the Duck congregation, that credit, and not capital, was the true basis of mercantile transactions.

"Jack Sprot," grunted the surly man to his neighbour, "you don't chance to know his whereabouts, do you?"

"No, I don't," was the dry reply, "and if I did I should not tell."

"Oh! it's no consequence, only I knows a party as wants to pay him a rather heavy balance on a corn account—that's all."

* * * * *

"Any luggage?" inquired the porter of the surly man at the Salisbury station.

"No!"

Then why did the surly man hang about so while Westby was engaging his fly?

"Ouze 'ouse at Wishford?" inquired the flyman, turning round on his box. "I'ze zard a' yearing."

"Mrs. Wilson's."

A gleam of satisfaction lighted up the surly man's face.

"Confound that fellow!" muttered Westby; "there's a queer mosaic look in his face, and his wanting to know the whereabouts of that man Sprot—it's rather suspicious."

* * * * *

The district of Salisbury Plain is on this wise—bleak down, intersected with valleys; bleak down, but not barren, corn-land here and there on the highest ground; green valleys, with trout-streams and water-meadows, and in these valleys a succession of villages where dwell the tillers of the bleak down, the shepherds, and their masters, the owners of the many thousand sheep which feed on the steep down slopes.

Westby's route lay along one of these valleys through Wilton. The day was so gloriously sunny that it needed the east wind to record the season of the year. To the left of the turnpike-road, somewhat less than two miles distant, lay the high down line of Salisbury race-course, and on a lower road running parallel with the turnpike, with a goodly cultivation between the two roads, was a straggling line of cottages—George Herbert's Bemerton, and Quidhampton—with simmering smoke amid the leafless trees, and sparkling water-gleams from the winding river and the water-meadows in the rear. Then on, beneath the shadow of Wilton Park wall, and skirting the town of Wilton, into the open valley again, with a glimpse of the white Byzantine tower of Wilton church across the water-meadows, and so along the valley with a trout-stream hard by the road,

fascinating to fishermen's eyes, and Grovely Woods crowning the high down ridge to the left, and on the right, Salisbury Plain proper, shelving from the high land gently to the road.

Westby arrived at his destination.

"No, Mrs. Wilson was not at home."

"And Mr. Newton?"

"Out with the harriers," replied the man, to Westby's anxious inquiry.

"Where did they meet?"

"Druid's Head, sir."

"Is there anything at home that I can ride?"

"Only old Ironsides, sir; but Mr. Newton says he wouldn't ride him for a hundred pounds."

"Hum," muttered Westby, "my ride's worth more than that. Tell the groom to clap on the saddle. I know the old horse has got some stuff in him yet. By the bye, I expect somebody will be calling presently to see Mr. Newton on particular business; you will say that Mr. Newton is certain to return here directly after the hunting is over. I shall save time if I go round to the stables and get on the downs by the back way. Send me out a mouthful of bread and cheese."

* * * * *

Up a steep chalk cut from the valley, on to the high ground—it made the old horse blow again! and then a vast surface spreading out for miles in the bright sunshine, a perfectly open country without hedge or ditch, undulated by the deluge waters of pre-Adamite time, covered with turf, and here and there ploughed land, and young corn-crops of emerald green, and dull green patches of swedes, and thinly scattered plantations of dark fir. But overhead! the crowning glory of the land,—a grand hemisphere of sky closing to a low horizon marked by down lines of exquisite curve, or darkly fringed by far distant trees,—masses of dazzling white cloud grandly marching across the bright ether—those cumuli which walk upon the wings of the wind.

I do not say that it is a land for poets to sing, but it is a clean, wholesome land, delicious to London eyes,—a land for drawing a long breath deep down into the lungs,—a glorious draught free from carbon sediment, opening the senses to that feeling of abundant health which pervades every object far and near.

But I cry a truce to all elaborate descriptions of this scene. Your horse begins to feel the fascinating turf, the curb tightens insensibly in the hand, and you are off into a glorious canter long before you have had time for a minute view.

Nevertheless Westby had to pursue a very conservative policy with regard to the old horse.

"Stand still, old gentleman, can't you? Allow me to look for the hounds." Westby's eyes sweep over the country. "There they are!—they're 'drawing' those swedes by the Druid's Head." The huntsman's horse is knee-deep in that green sea which swallows up the hounds. Straining your eyes hard, you can just perceive glancing tips of white which hurry to and fro. Ah! there's that furthest man waving his cap, the huntsman gallops up, the white tips suddenly converge, and dash on to the turf in an indefinite white mass. It's too far to hear couplet and chorus. "Steady, old man, steady!" The keen east wind is pouring new life into the old horse. "They're coming right to us!" What a pretty sight! hounds and horsemen growing nearer life-size every moment, speckling the turf dips with excitement. "Whoa, boy, whoa!" The old horse frets against the curb. "Ah! they've lost *her* in that furze!" Westby will be up with them in a minute or two. It's too far to distinguish faces, but that's George Newton, by his big black horse. Strange he should be so far in the rear!

"Hold hard, sir, pray!" shouts the huntsman to Westby, who was making straight for his friend.

Westby, in his eagerness to reach Newton, did not perceive that he had almost ridden over the hunted hare.

Whir! whir! whir! go a large covey from the furze.

By Jove! that lady's horse, the chesnut, has bolted. No! how well she rides!

Hark! the hounds are singing to their work again.

"I'll take the fidgets out of you!" cries Westby, giving the old horse his head.

Away they go! down the turf slope, across the Devizes road, up the turf on the other side, right ahead. Newton well up this time—Westby pushing along the old horse at his best speed, in hopes of overtaking his friend.

The east wind rattles against the face, and whips up a tremendous glow, and cuts tears out of the eyes.

"Very pretty!" exclaims Westby, as the lady with the spirited chesnut skims a line of hurdles. "At it, old man!" and he rams his heels, for lack of spurs, into the old horse. "Over! All right!" The old horse recollects his work. But, alas! it won't do—a deal of fuss and pulling for the first three minutes, and then the old horse begins to sing a hollow tune.

"It's no use my scampering on at this rate," thinks Westby, "I shall knock all the wind out of the old fellow;" so he pulls up the old horse into a walk, and watches with disgust the whole "field" sweep away.

By dint of some clever short cuts, and thanks to divers checks and doublings, Westby managed to keep pretty well in sight, but "puss" did not cry "enough" till she had got, with many a twist and turn, to Stonehenge.

In among the old grey stones, as Westby trots up, were steaming horses, and men with hot, contented faces, and eager panting hounds, clustered round the master, who held gallant "puss," worthy of her fate, in "his red right hand."

"Here, Gaylass! Gaylass! Beauty!"

"There's George Newton!" through the interval in the stones, on the other side of the circle. Westby urges forward his horse—he curbs him in the next moment—there's a lady at Newton's side. One glance, as she half turns her face—Lilian Temple!

But the old horse was minded to push on, and the reins had fallen loose in Westby's hands.

"Who'd have thought of seeing you?" exclaimed Newton.

"Karlo Magno!" broke involuntarily from Lilian's lips.

Ah! the east wind and long gallop had steeped

her fair face in rosy tints, and ruffled her golden hair beneath the shadow of the dark felt hat. The reins hung loose in her small gauntlet wax gloved hands. The chesnut did not want the curb.

"Lilian! an old friend of mine, Mr. Westby," exclaimed Newton.

"An old friend of mine too, George."

How that word "George" stung Westby.

"He's known me ever since I was a bit of a child," continued Lilian.

"That's strange enough!" and a slight shadow passed over Newton's glowing face.

"I want a word with you, Newton: Miss Temple will excuse us for a minute." Westby turned his horse aside, and Newton followed him.

"I'm engaged to her, Westby—"

"I congratulate you;" but the words grated in Westby's throat.

"I'm very sorry at such a time to break upon you with bad news. Why on earth haven't you answered our letters?"

"That cursed bank, hey?"

"I never found out where you were till last night. We've written continually to your house."

"I've been staying at Mrs. Wilson's for the last few days," replied Newton.

"Secker could not come himself, but he begged me to come, as an old friend;—the truth is, you must leave the country immediately."

Newton's hot face grew very pale.

"They'll be down upon you for every penny you possess—you are known to be one of the richest shareholders on the list."

"I can't go now, Charles."

"You must either go or be ruined! Why, I'm all but certain there's a fellow on your track now; below in the valley there—"

"But that girl! that girl!" murmured Newton, looking back on Lilian. "Did you see how she rides, Westby? Such a light hand. By Jove, my man can hardly handle the chesnut. I'll risk it!"

"Don't be a fool!" exclaimed Westby, losing patience.

"Curse that infernal sanctimonious scoundrel, with his ten per cent."

"We haven't time for regrets now, George."

Newton reflected for a moment.

"Westby, we'll go straight to Brighton, to her father's, be married there, and then go to the continent. What do you think?"

"It is for you to think," replied Westby, gravely.

"I know she'd do it. No, no! I could not in honour marry a girl with my affairs in such a state. There, I'll take her back to Mrs. Wilson's and be off."

"It is not safe for you to return to Mrs. Wilson's."

"But, Westby, I can't say good-bye to her here," replied Newton, piteously; "do help me, for heaven's sake."

Westby considered what could be done for the best.

"You know my mother's cottage at Shrewton: go straight there, it will throw them off your scent. I'm sure Mrs. Wilson will manage to take Miss Temple over this evening to see you; you can then make your way to Devizes and get the railway."

"Thank you, old boy."

Newton rode up to Lilian—they turned their horses towards the "Druid's Head."

Westby, as he followed, kept muttering Newton's words: "He can't marry with his affairs in such a state." There was a strange conflict at work in his heart.

Near the "Druid's Head" the lovers waited for Westby to come up.

"I leave this lady in your charge, Westby," said Newton, in a broken voice, and after pressing Lilian's hand to his lips, he put his horse into a canter. The chesnut would have followed, but Lilian reined him in with some difficulty, and then, shading her eyes against the golden distance, she watched her lover's dark receding figure.

"Which is our way?"

"Right for that 'folly' yonder."

They rode along the ups and downs of the turf in silence. A solitary horseman came up with them; it was the surly agriculturist of the morning mounted on the strangest of old screws. He glared curiously at Westby.

"Seen the 'ounds?"

"No more hunting to-day; there's no scent," replied Westby, with emphasis.

"Oh, *haint* there!" replied the man, grinning as he rode on.

Down the chalk cut again into the valley, which was filled with warm light and lengthened shadows. The water meadows, green enamel in the afternoon sun, inlaid with glittering bars of gold—and so on to Mrs. Wilson's house.

* * * * *

"George Newton ruined!"—and Lilian locked the door of her room, and was alone. Then for the first time she beheld in clearest definition her real motives for accepting George Newton. Love, alas! in the slenderest proportion—pique at Westby's low estimation of her character and rejection of her love—that one thought tinctured all her conduct, rendering her utterly careless as to whom she married, provided the wooer possessed the disposition and means which might ensure a pleasant worldly existence. Had she not learnt from Westby's words that she was unfit for any condition higher than that? So she had allowed George Newton to love her, which was all he asked—perhaps she had even preferred him to most men she had met—and she was to have the use and enjoyment of his wealth in return.

I repeat, she beheld all this now for the first time; her actions had been spontaneous and the motives indefinite: it was only the thought of poverty which forced her to make an exact estimate of her love for George Newton.

So Lilian had her punishment for giving her hand without her heart. A feeling of pique to rest upon in a life of straitened means and struggle! Riches and poverty, it was a strange contrast. Many a time in those Swiss excursions she had walked silently at Westby's side, picturing in her foolish mind the idea of poverty as his wife; she had striven to realise all the hardships that need

be endured, and her affections had always deepened towards him with these thoughts. But George Newton poor, it was a desperate struggle with duty, and tears, and remorse.

* * * * *

"I have left her in her room, poor girl," said Mrs. Wilson to Westby, as she entered the library. "I can afford her no comfort."

"She does love him, then," muttered Westby to himself.

"Lilian has told me about the arrangement for seeing George. Now, only to think he should have been so foolish as to meddle with that wretched bank."

"Foolish fellow! there was no stopping him; —but tell me about this love affair of his, I met the Temples in Switzerland last autumn."

"Well, I happened to fall in with them at Paris: we were staying at the same hotel, and I became very intimate; they made me remain at their house in London for a few days on our return from the continent. George Newton saw Lilian at the theatre, and was immensely struck with her; he found that I was staying with the family, and he made me introduce him—in the shortest possible time he made her an offer, and was accepted. Before this occurred Lilian had promised to stay a short time with me while my son was away; I would not forego the promise—the result is that George Newton has insisted upon taking up his abode here, he says it's such a bore to get across the hill at night. I find you're an old friend of the Temples."

"I used to be very intimate with Frederick Temple; I suppose he's in India by this time; he was intending to get down to Marseilles soon after I left Interlachen."

"Poor George! it will be a sad blow to him to leave the country—I never saw a man more deeply in love."

"But he'll have to go for all that," replied Westby.

* * * * *

Westby and Lilian did not meet till it was nearly time to start for the night ride to bid adieu to her lover. She entered the room veiled for warmth against the night air. Mrs. Wilson who had been conversing with Westby, arose to prepare herself for the journey. Lilian would evidently have accompanied Mrs. Wilson out of the room, had that lady not begged her to stay in order that Mr. Westby might explain some particulars about Newton's affairs.

"I suppose we must try to get to the down road," said Mrs. Wilson.

"It would be less risk for Newton," replied Westby; "I have been talking to the coachman, he thinks he can manage it."

There was a dead silence when Mrs. Wilson had left the room. Lilian drew back her veil, her face was very pale and her eyes red with crying.

"Have you heard from your brother lately?"

"Yes, he's quite well, he had joined his regiment at Meerut.—Dear Fred, I wish he were here now," and Lilian broke into tears. "I've no one to speak to, to advise me—"

"Mrs. Wilson!"

"She's Mr. Newton's friend!"

"Well then—"

"This interview, this interview, it's terrible."

"This bank affair is indeed a sad misfortune."

"I can't go—dare not go," she covered her face with her hands.

"But you promised—"

"Oh, Karlo Magno, despise me, tell me I'm heartless—wicked—I never ought to have accepted George Newton—I've learnt that now—but things were so different when he made me an offer."

Westby trembled with strange sensation at her words.

There was a terrible pause.

Oh, what power was in Westby's hands! what temptation in his burning heart!—he felt he held Newton's fate—but the man was his friend, had fairly wooed and won the girl, in the hour of misfortune had left her in his charge; nevertheless he recollected that day at Interlachen, when he might have called Lilian his own, and now there was one last opportunity thrust in his very fingers—one firm grasp.

"Ah, Lilian!—"

She started at his voice, and stood up, gazing earnestly on him with her tearful eyes. Words of folly, and far worse than folly, were on his lips, but this movement of hers arrested their utterance.

"Karlo Magno! listen to me," she spoke in a low firm voice. "You are Fred's oldest friend. Chance, I know not, it may be God's ordering, has placed you near me now. You know my brother well, you *do* know him because your nature is true and good as his." Westby shuddered, and instinctively shrank back. "I want to speak to you as I should have spoken to him, it would strengthen and comfort me to hear your answer, knowing that that answer would be his. George Newton was introduced to us by Mrs. Wilson; he sought the introduction, he was greatly struck with me, she said. Well, in a short time he made me an offer. I was urged by my father and mother, by all, to accept him; his wealth and position, good nature, good heart, were strongly insisted on—I did accept him! Mind, I take the full burden of that act on myself. I loved him, as hundreds love, who marry in a good position. I do honestly believe as a rich man I could have made him a good wife—but ruined! there are all sorts of hardships, need of deepest love to endure them, and this, alas!—folly! I feel all this is idle talk; while I speak, I know Fred's answer, yet I should like to hear some one pronounce the words. Am I still bound to George Newton?"

Called upon to be a counsellor, confided in as a father confessor, stung to the quick by a sense of his utter unworthiness for such a position, shamed at his own base weakness—yes, and the very words which he ought to speak placed in his mouth by the strength of her who was asking support of him—worst of all, to have to play the impostor, assuming a moral authority to which he had forfeited all claim—

"Am I bound, Karlo Magno?" she thought in his silence he was wisely pondering her words.

"You are bound, Lilian," he replied, affecting as much decision as lay in his power.

"Enough," she replied with great calmness. "I can go and see him now. Karlo Magno! you have helped me to do what is right—I must have failed but for you."

Ah! the bitter mockery of her words, to wear the star of honour on a heart conscious of shame.

Westby sought to change the current of the conversation.

"You talk about being ruined," said he. "I hope things are not as bad as that!"

"Mr. Newton told me so!"

"Well, I've every hope when Newton gets away that we shall be able to make some compromise, so that after all his loss may not be very serious."

"Why did he try me in that manner?" exclaimed Lilian vehemently; "it was cruel, very cruel."

"Pardon me, it was only honourable to state the worst."

"Well, well, he might have had my answer at once, this afternoon as we rode along—the words of assurance were on my lips, but he stopped me, he would hear nothing till I had thought the matter over—he left me, and then came thought and horrid doubt."

"Lilian, he acted well!"

"Not ruined! Oh! thank God for that. Why then this is but a temporary affair, he may come back shortly."

"He may! Nay, Lilian, I promise that he shall," exclaimed Westby, earnestly. "I assure you, on my honour, that I will work for him in this business, as I would work for a brother, to set him right."

Work was Westby's ointment for remorse.

"Karlo Magno, you are my good genius—you always appear at the right moment—"

"Nonsense, Lilian."

But she would clasp his hand, and her face bore the same expression he remembered so well that evening at Brienz. He had not begun to love then, and he had *ceased* to love now—his foolish, morbid love was utterly quenched in a deep sense of shame. She was no other to him now than Fred Temple's sister, engaged to his oldest friend—fairy Lilian, if you will, the playmate of early years.

And he in her eyes still bore that same greatness which had fascinated her heart in Switzerland—a being too great and grand for her poor trivial nature—an idol to be admired, or rather worshipped at the heart's shrine. Ah, Lilian, Lilian, our finest idols are only made of clay!

"Not ruined!" exclaimed Lilian to Mrs. Wilson, as that lady entered the room. "Not ruined! Mr. Westby tells me so. Mr. Newton will doubtless get over this misfortune without great loss."

* * * * *

"If you please, ma'am," said the butler, entering the room, "there's a man at the door inquiring for Mr. Newton. He wants to see him on particular business."

"Detain him in conversation as long as you can," replied Mrs. Wilson. "I know I can trust to your discretion, Simmons: mind, not a word in the house that we are gone. We will go through the French window in the library, instead of going out at the hall, and then by the garden to the stable-yard."

Mrs. Wilson's brougham was ready at the stable door—the man was at the horse's head.

"Beg your pardon, sir," said the man to Westby, "you'll want a thick coat on the downs."

"All right; jump up!" cried Westby, catching off the horsecloth, and throwing it over his shoulders.

The horse felt the cold wind, plunged, kicked, and then went a head.

"Frost, sir!" said the man.

"Is it?" rejoined Westby. He felt burning hot.

The wide sky was thick with stars at their brightest in the frosty air; the clear open plain was filled with a low undertone of light.

Pretty work for the "whip"—two wheels in a cart-rut all the way up-hill, and the other two wheels wherever they could manage to pitch, the horse remarkably fresh.

"Look out!" cried Westby, "that dip ahead!"

The man turned the horse, the brougham swerved to one side with a violent jerk, but at the speed they were going was caught up by a rise in the ground. All safe. Swish! swish! swish! they were driving right through a field of swedes. One deepish drop, and they got safe on to the Devizes road.

"Which way, sir?"

"Left."

You could see the white chalk line of the road right ahead in the dim light.

"I can hardly hold him, sir."

"Give him his head then!"

Up and down the sharp dippy hills in the chalk road, the frosty wind fanning Westby's cheeks.

"Turn on to the turf now—to the left. That's the track! We must leave that plantation to the right."

"Now then, foolish!" The horse started and swerved at a white mass in front. "Whohooo! it's only a sheep," cried the man, flicking at it with his whip. Crish! crish! crish! went the wheels against the frosted furrows. "Whoa! they've been ploughing it up here. Back! back! That's right! Now away to the left! We shall get to the road directly."

* * * * *

"Any breath left, ladies?" said Westby, as he opened the door.

"Let me hope the best for the springs," replied Mrs. Wilson, goodhumouredly. "I trust we shall be allowed to go home in peace by the road."

"Lilian," said a voice behind. It was George Newton: he led her into the house.

THE HARVEST.

The way in which the prospect of any modern harvest is regarded in this country is a striking evidence of the change which a few years have wrought in our civilisation. At a time within my recollection, when the population of the three kingdoms was only two-thirds what it is now, when the general mind was narrower, and the interests of classes were locked up under protective laws, the question of the harvest was a mere bore in

anticipation to the greater part of society. The mention of it in the King's speech was considered a mere form, like the assurance we hear repeated every winter, that we are in a state of amity with foreign powers. The farmers' complaints really were constant. If the harvest was bad, they pointed to the ruin caused by rain, or drought; saying nothing of the compensation they derived from the artificial high prices under the sliding-scale: and if the harvest was plentiful, they groaned over the low price of corn. So, the farmers' complaints went for nothing with society generally. When bread was dear, the middle classes felt the misfortune; and so, above all, did the artisan classes. The rural labourers were fed from the rates, and were kept so low always that the character of the harvest made little difference to them. Scarcely a year passed without applications to parliament about agricultural distress, so that the evil seemed to be a necessary and interminable one; and people turned from it in hopelessness. They did not seek to know beforehand what the harvest was likely to be in any year; and when the point was settled, they had nothing to say to it but to lament or rejoice over dear or cheap bread, without looking further than their own account-book and baker's shop. The wide range of ideas which millions of minds now run over when the mention of the coming or past harvest occurs, was not then opened to the many. It is not very many years ago (I think it was shortly before the repeal of the corn laws), that I heard a clergyman, kind-hearted and active-minded, and the son of a bishop, say with a smile of complacency, that he was not troubled by the menace of a ruined harvest.

"We hear the same thing every few years," he observed; "and you know there always *is* a harvest."

"Yes,—for *you*," I replied.

I took leave to tell him that his remark was unbecoming a clergyman; for the moral condition of the people is the clergyman's first business: and if he did not know, he ought to have known, that a bad harvest meant increase of crime, as well as infliction of misery. In later times, when I have observed the general understanding established throughout the nation, in regard to the common interest in a good harvest, and the precise bearings of the fact, the self-satisfied composure of that well-meaning clergyman (which he mistook for piety) has recurred to me, with undiminished surprise that within twenty years such insensibility should have prevailed on such a subject.

The last and present year furnish a capital test of our improved knowledge and sense, as well as our improved circumstances. If ever there was a dreary year for farmers it was 1860; and it followed a sufficiently trying one in 1859. Yet we hear nothing of the grumbling of the farmers. They are no longer thought bores, or worse, as a class favoured by the laws and the aristocracy, and yet never contented. The invidious favour is gone; and with it everything that was unmanly in the character of the order. Their business is no longer a lottery, as the corn laws and our agricultural ignorance made it till fifteen years ago. Farmers have now to seek their fortunes as other men of business do,—by relying on their own sense, knowledge, and industry; and they have already arrived at being able largely to control or counteract the caprices of the weather, which were their plea formerly for taxing all bread-eaters, to save bread-growers from loss. I do not know how it strikes less old-fashioned people, but I own that nothing has been more impressive to me during these two remarkable years, than the dignified bearing of the farmers of the country. They have had serious losses to bear; and something worse than other classes have to endure in sustaining losses. A merchant is subject to bad debts and unfortunate issues to speculations: but the loss comes, as it were, in a lump. A certain portion of his property is gone; and his expectations are mortified. The farmer has to endure the protracted trial of seeing his property go; and his mortifications, in a bad year, are drawn out from day to day, till the seasons have run their round. What the trial is can hardly be conceived by dwellers in towns, to whom the result comes in the dear loaf, and the beef and mutton at 10*d.* or 1*s.* the lb. Where I sit, and look abroad over a rural scene, it is much easier to sympathise with the farmer. There are the fields into which no seed could be got last autumn before the frosts came. In yonder homesteads and cottages, the labourers sat round the fire for weeks after Christmas, till the women were heartily tired of their being always in the way: but they had nothing to do out of doors; and the farmers saw all their possessions locked up, as it were, from their natural uses. For a few weeks in February and March everybody was busy, and the proprietors of land and stock more hopeful. They would have no autumn sown crops; but they must make the most of the spring; and the hard and prolonged frost had benefited the soil, and must have destroyed much vermin. If the spring grasses did but turn out well, it might be a fair year yet. But then came the drought. In our part of the island it rained only three or four times between Easter and July. Day after day the farmer looked in vain for the growth of his grass. It did not seem to grow at all. April, May, and even June passed on, and the hill sides showed no tinge of the vivid green which signals the herds and flocks to the upland pastures. Buying and buying, all through the spring, to feed the beasts who ought to be grazing,—each week hoping for rain and green grass, and none coming, — this is a trial of patience. The cereals came up thin and straggling, and withered more and more under the drought: and the grass in the hayfields was thinly in flower, while the undergrowth remained stationary. At last, when all resources for feeding the cattle were about exhausted, the rain came. Everybody cheered up. The cereal crops might yet make up for lost time, or quality might compensate for quantity: and as for the hay,—it must be in part seeded grass, and in part too short; but there would be a crop by waiting three weeks for it. But it so happened that the rain, having once arrived, scarcely stopped; and it was so heavy as to be very mischievous. Where light and poor hay crops were got in at

the usual time, there has been excellent grazing since. It is quite a spectacle,—the sleek enjoyment of the kine in their pasture of vivid green, when the rains intermit so as to let them graze. But the whole chapter of the hay is dismal. Even where the mowing machine was used, the grass lay soaking and drying alternately for weeks. In the bright morning the haymakers trooped out, and worked till noon, when the clouds hurried up and spoiled all. Or, after a rainy morning, and a bright clearing at noon, all hands would go to work for as long as they could see ; but before sunset they were driven home by wet, which lasted all night and for days afterwards. In half a dozen fields and meadows I have seen parties of labourers at work for weeks, at four or five shillings a day each, in this useless way. I have seen no small quantity, cut and made at this cost, choking up the channel of the brook, or swimming in the flood. I have seen it turning brown and grey on the ground, and then almost black, till it seemed hardly worth carrying ; and, finally, I saw on Sunday a party of haymakers sent into the field after church,—a thing never done but in extremity,—and, after working for a couple of hours, driven away by the pitiless rain. All this time the oats and potatoes have been a great anxiety to the farmer. The promise of both was very fine ; but the grain is prostrated under the rain and strong winds, and the root has rotted. Now, these things must be admitted to be as trying to human patience as can well be. If the farmer had been told on New Year's-day that his loss in the year would amount to so much, he might bear it as the manufacturer puts up with a sudden depreciation in the value of his stock, and the merchant with a bad debt : but the long and varying suspense, and the singular aspect of spitefulness in the weather of such years as the two last, certainly constitute a peculiar trial to the farmer. As far as I can learn, our countrymen bear it with true British manliness. We used to hear of agriculture "coming to Parliament whining for protection." Now that protection is over, we hear no more about whining. Every order of producers is now above it.

As for society generally, it has come to understand the bearings of a good or a bad harvest. Of a good harvest I need say nothing ; for it speaks for itself. A bad one, we now know, means, in the first place, the throwing away of several millions of money. We generally spend twenty millions in the purchase of grain and flour. We do not grudge it, though it is an unproductive expenditure. We do not grudge it because we cannot (or we suppose we cannot) grow enough at home for our consumption ; and of course we must in the first place be fed. But we feel differently when we have to spend another ten or twelve millions in buying as much grain as we have seen rotting or failing in our own fields. The failure of last year's harvest has cost us in actual money twenty millions more than the average expenditure : and every man of intelligence now, clergy or lay, understands what this means. Instead of simpering and averring that "there always is a harvest," the most exclusive members of society know that this tremendous loss of capital restricts expenditure through all ranks, sets everybody economising, slackens manufacture, diminishes earnings, and affects the money market injuriously by carrying away our gold to foreign countries : for we must have the grain and flour, whether the countries which produce it can or cannot take any of our products in exchange. If they do not want our goods, we must pay in gold. In short, put it in any way you like, the badness of last year's harvest caused us a dead loss of twenty millions direct ; besides inflicting a variety of inconveniences and troubles.

The special trial of this year has been the uncertainty. Last autumn, and the frosts of midwinter, taught us that we could not have a harvest above the average : but whether an average, or how much less, has been a question almost to the last moment. It will even now take some weeks to satisfy us of our precise position ; but we are certain that, on the whole, we are not unfortunate, and that at last we have left behind us the mischiefs of the bad harvest of 1860. We should still have felt them if we had had a second such harvest, because the protracted competition with other nations in the grain market would have made foreign wheat and flour very costly to us. Now that we shall want to buy little more than our regular quantity, we and the French shall not be bidding against each other, constantly enhancing the price of food to each other.

I never remember the reports of the crops being more various than they have been since the spring equinox. Up to that time, all the news from all quarters was equally bad. A very small proportion of our farmers had, by a thorough and systematic use of agricultural machinery, got their harvest cleared away, and their seed in, in spite of the malice of the weather ; and where this was best done, the wheats stood the winter best. The less advanced practitioners made nothing of their land at all, and could only hope for an early and favourable spring.

It would be difficult to say what the spring was, for the whole season has been singularly various in different parts of our islands. In parts of Scotland my description of our drought and rains would be testified to as a fair account of the spring and summer ; while in other places the spring has been wet and the summer dry, or each has been both. On the whole, by what I can gather from the sum of agricultural reports, the wheat crop is decidedly below an average, but a considerable portion of it of remarkably fine quality. The unfitness of last year's barley for malting purposes was an evil of wide operation. This year, the quality is supposed to be very fine.

Some people tell us that oats are now about the best crop ; but the real character of the whole oat crop is never known much before the end of September ; and there is certainly a good deal so laid and broken as to be scarcely susceptible of cutting,—yellow, matted, and almost mouldy near the ground. The fate of the potato came upon us almost like a surprise,—so fine was the promise up to July. It is a great misfortune ; but we shall feel almost as if we deserved it till we have either discovered the nature of the disease, or left off running the risks of potato-growing for some years till we can begin afresh, with new sets on a

renewed soil. Till we obtain either the knowledge or a pause in the growing we may expect an annual disappointment: for we do at least know that there is some cause which appears to be permanent.

We hear other roots ill spoken of this year. That mangold should fail is a serious misfortune to cattle and their owners. The failure is certainly not universal, though by all accounts it must be very wide spread. I know of some which grew rather patchy after the drought, but has had no drawback since, and promises to be fine. Two causes are assigned for such failure as there is. The seed from last year's crop was not properly ripened, and very improperly mixed with the weeds which flourished so rankly; and a new maggot has been feasting itself in the inside of the leafstalks, destroying the plant in the most insidious way. Carrots have failed from bad seed: and turnips, which up to a late date promised well, come out badly from examination,—the roots having run to "fingers and toes," as the country folk say. Beans are bad; peas fine. So say the majority of reporters; but there is scarcely any assertion about any crop which is not matched with a precisely opposite account from some part of the country. The only general statement which can be relied on is that, on the whole, light lands and their produce have done well, and clay lands and their crops less well than on the average.

Our fortune is therefore moderately good only, in regard to the produce of the country this year. The year has, however, done much to improve our prospect in time to come.

First, we have got a Drainage Bill, which, if made the most of, will effect much towards that Arterial Drainage which is now the chief want of British agriculture. The bill went so quietly through parliament that it may be doubted whether there is as yet any due appreciation of the powers which it gives. Under it, the energetic portion of the proprietors of any district needing drainage can effect their object by application to the Enclosure Commissioners, through whose intervention they can obtain a private Act of Parliament in an inexpensive, ready, and secure manner. No obstructive neighbour need now be allowed to spoil land, and ruin health, and fill the churchyard, by forbidding the waters to pass his property. We cannot expect to have everything on the first asking; and this bill does not give us a systematic emendation of our watercourses, from their spring-heads in the hills to their outfall into the sea: but it enables private enterprise to improve large areas by effectual drainage; and it removes the antique and vexatious impediments by which the welfare of the many, living above and below, has been sacrificed to the selfishness or ignorance of some one proprietor, or some clique of gentry, strong in will, who would not listen to reason. It will not now be the fault of the law if we suffer hereafter as we have suffered till now from floods in critical seasons, and bogged land all the year round, for want of efficient watercourses. We ought to see, for years to come, a great straightening, and clearing, and deepening of the channels of our streams, —a great strengthening of the banks,—a great substitution of steam for water-mills, and consequent abolition of weirs,—each spoiling more land than any mill can be worth.

This Drainage Act is one great gain of this year. Another is the prodigious extension of the use of agricultural machinery. There is nothing like bad weather for convincing husbandmen of the benefit of machinery which saves time. The lesson of last November, with its brief seeding-time, has shown its effects in the wide adoption of almost every kind of new and approved implement. One appears, to be stared at, here and there in the most old-fashioned corners of the island; while, in the neighbourhood of the great manufacturing towns, some costly instrument is seen on its journey to a field, hired by a party of allotment-holders, to mow, or reap, or plough, or sow quickly for them, at their joint expense.

The phenomena of rural labour are becoming more remarkable every year. The faster the use of machinery spreads, the more deficient does labour become. We hear suggestions of letting soldiers be employed in harvest-labour, and the few able-bodied inmates of workhouses. We hear with satisfaction of emigrants returning from America, since the civil war there began. The Irish who come over for haymaking and harvest are fewer and fewer; and if any of them are found begging, it is because they have come to a district where their work is better done by modern methods. When we obtain the system of returns of agricultural statistics, which cannot be much longer withheld by the prejudices of the less instructed class of farmers, there will presently be no spare labour anywhere, because it will be evenly distributed; and the total amount is already insufficient for our needs, —great as is the amount of work saved by machinery. Where agriculture is most advanced labour is most readily absorbed, and best paid.

The failure of the mangold this year has directed attention towards a mistake which has been admirably exposed in France, where the error has been greater than with us. While growing desperate under the ravages of insects, we have been destroying their natural enemies, the small birds. Several agricultural societies in France have been petitioning the legislature to protect the small birds which the peasantry destroy for food,—causing the devastation of whole acres of grain and roots for the sake of half-a-dozen bird-pies. Our cottagers do not feed on robins and sparrows; but too many people kill the small birds because they destroy sprouting vegetables, and help themselves to the food of the poultry. Then we hear dismal tales of the wireworm, and the maggot which has been so fatal to the mangold this year. The discussion about the wireworm, and various aphides, and the grub of the cockchafer bids fair to preserve the races of small birds in this country, and to restore them in France. It promises, moreover, to restrict the meddling of game-preservers within due bounds. They have destroyed owls, weasels, and polecats in such numbers as to have increased the rats and mice beyond all endurable bounds,—injuring hedges and ditches, and ravaging crops till the mischief is seen, in bad seasons, in its full enormity.

In France, the deficient crops are avowedly owing, to no small extent, to the unchecked

ravages of insect plagues; and in England, the gamekeepers are shown how they are ruining their neighbours' crops and fences without saving their eggs, young birds, and leverets, which fall a prey to rats more than they would to weasels and hawks, and owls, if these latter were allowed to make war on the rats and mice.

We have, when all is said, to be thankful for a tolerable harvest which will preclude hardship, though we cannot consider it a rich one, fit to elate the spirits of the nation. We may congratulate ourselves on having made some progress towards obtaining future harvests, more ample amidst the chances and changes of weather than our fathers won from the most golden summers. We have surmounted the misfortunes of last year better than we could have expected; and its adversity has taught us to make ourselves more secure for the future. If the year between this harvest and the next is to be a season of national trial, it will not be from failure of the nation's bread.

From the Mountain.

A PHASE OF THE PAPER QUESTION.

THE RAG MERCHANT IN BRITTANY.

There live amongst the mountains of Bretagne a peculiar sort of tradespeople, called by the natives "Pillavers." The pillaver is a nomadic rag-merchant, leading in every respect the life of a gipsy, except that he does not, like him, drag his family with him, but leaves them in some cave in the mountains to await his return from his trips through the country, where he purchases quantities of rags to re-sell them to the paper manufacturers. He goes from farm to farm, cottage to cottage, and hut to hut, where he announces his arrival by the lugubrious cry—"Pillaver! Pillaver!" His favourite haunts are the most wretched and poor huts, where he is sure to find his commodity. He is a sort of notorious hobgoblin, who knocks at the doors of the unhappy, and reminds them of their poverty. He is, therefore, hated and possibly shunned, while in rich families his call is considered an insult, and his knock is usually answered by "Be off! there are no rags here for you."

"Very well," rejoins the pillaver, in an ominously ironical tone, "I will come by-and-by," and moves on to a near cottage to find what he seeks.

But even in the huts where a few rags are sold to him he is received with contempt and abhorrence, and is seldom allowed to advance as far as the fire-place. The rags are brought to him to the threshold, where the bargain is made. His honesty is so distrusted that even the poorest of the poor fear his thieving craft; he is—as the song goes—without church and religion.

We will cite, in illustration, a few stanzas of the popular song about the pillaver:—

There he goes, goes the pillaver, like the Wandering Jew. He finds in the country neither relations nor friends, and at his approach the doors are closed, for the pillaver is a man without faith.

On Sundays and holidays he is always on the road; he never hears mass nor service. He prays not at the grave of his parents; he confesses not to his priest, and thus it is said in the lowland, the pillaver has neither creed nor parish.

Go on, poor pillaver, the road is hard under your feet, but Jesus does not judge after the manner of men; and if you are honest and a good Christian, you will be rewarded for your pain and toil, and awake in glory.

You see the dirty rags on the back of your nag? Well, the water of the river will soon cleanse them, and the hammers of the paper-mill will soon bruise them, and paper will be made out of them more white than the finest linen.

Thus it will go with you, poor pillaver. When once you have laid your rag-covered body into some grave, your soul will fly away clean and white, and the angels will carry it into Paradise.

T. M.

THE CINQUE PORTS AND THE BREDENSTONE AT DOVER.

Our ever youthful Premier has recently given éclat to an ancient ceremony which has been revived for the nonce out of the records of one of our most ancient and loyal institutions,—we allude to his inauguration as Lord Warden of the Cinque Ports and Constable of the Castle of Dover.

At the grand banquet given on that occasion in the "Maison Dieu," Lord Palmerston expressed his conviction that "nothing tends to distinguish a man more than a respect for traditions, where the latter are harmless in their character, and do not interfere with social progress." We may therefore be pardoned for carrying back our readers over a short retrospect of the past history of the Cinque Ports and the high dignity of their Lord Warden.

The Cinque Ports were originally five only, as their name implies,—Sandwich, Dover, Hythe, Romney, in Kent, and Hastings, in Sussex; and it is curious to note that when at a later period the two "ancient towns" of Winchilsea and Rye were added to their number, no change was made in their collective designation—they were the "Cinque Ports" still.

Attempts have been made by enthusiastic antiquaries to carry back the foundation of the Cinque Ports to Anglo Saxon times; but although it is probably true, as stated by Jeake,* that "the five ports were enfranchised in the time of Edward the Confessor" (for the fact stands recited in the first charter which they received from Edward I.), yet the organisation of the Cinque Ports as a body politic, such as it has existed during the last 800 years, is plainly to be traced to the policy of William the Conqueror in securing for England easy and constant communication with the continent, together with immunity from foreign attack; and the permanence of the Norman name of the seven towns collectively seems to warrant the same inference, in spite of the fact that all and each of the towns included under the collective name enjoyed some special privileges even before the Conquest.

It is scarcely necessary to remind the reader how, after the battle of Hastings, the southern and eastern coasts of Kent formed that portion of his newly acquired kingdom which William was most anxious to secure; how he made it his first object to reduce that tract of seaboard even before he

* "Magna et Antiqua Charta Quinque Portuum." Folio edition. 1728. With a comment by Mr. Jeake, long an inhabitant of one of the ports in question.

marched on London; or how he exacted from Harold, even during the lifetime of Edward, a solemn pledge that he would surrender into his hands the castle and keep of Dover,—no doubt as being the centre of all military action in respect of the opposite coasts.

"To enable his government to wield the resources of this maritime district with the greater vigour and promptitude," says a writer on the Cinque Ports, "William severed it wholly from the civil and military administration of the counties of Kent and Sussex, erecting it into a kind of palatine jurisdiction under a *gardien* or *warden*, who had the seat of his administration at the castle of Dover, and exercised over the whole district the combined civil, military, and naval authority; thus uniting in his own hands all the various functions which (to use the terms most intelligible to modern readers) we may describe as those of a Sheriff of a County at large, a Custos Rotulorum, a Lord-lieutenant, and an Admiral of the Coast."

It is well known that from the conquest to the reign of Henry VIII. the country at large had no navy, the maritime defence of the kingdom being all along entrusted to the "good men and true" of the Cinque Ports, who were bound jointly to fit out, at their own cost, such armaments as were wanted from time to time. Such being the case (the army and navy not being as yet separate services), the Warden of the Cinque Ports held really, to some extent, the modern post of Minister or Secretary at War; and formed part of the executive of the nation; and, accordingly, it is still a prescriptive rule that no one but a privy councillor is capable of being nominated to that office. In the reign of Edward I. the Ports, we find, were ordered to supply jointly a fleet of fifty-seven sail, fully equipped for fifteen days' service; but in the reign of Edward III. the respective quota was assigned to each port and its members, or tributary towns; and English history teems with similar examples. The gradual rise of the British navy and its permanent organisation have, of course, rendered obsolete the naval services of the ancient palatinate of the Cinque Ports, and indeed, even if such had not been the case, the same result would have followed from the great physical changes which have come over the ports and harbours by the change of the coast line; even "New" Romney and Sandwich—the latter once well known to history as the "port of London"—being now both separated from the sea by a mile or two of alluvial deposit, to say nothing of Winchilsea, which is now remarkable for little but its ecclesiastical antiquities.

Another proof of the Norman origin of the Cinque Ports is to be found in the use of the terms "Jurats" and "Barons," in lieu of the analogous Saxon names of "Aldermen" and "freemen," so familiar to English ears, and so redolent of English liberties. In former days, under the Norman and Plantagenet kings, and indeed to a much later date, the civil and municipal rulers of the Ports used to meet and transact their business in a Parliament of their own, the framework of which still remains in the "Brotherhood" and "Guestling," which is convened from time to time for purposes of internal regulation. It was assembled during the present century in 1811, and again in 1828, and more recently on two occasions, and according to present arrangement it is ordered to be convened once, at least, in every seven years. When the Brotherhood is convened, the barons and combarons still meet in the parish church at New Romney to elect a speaker with the ancient solemnities, which are celebrated with a scrupulous adherence to ancient precedent, that, pleasing as it may be to the lover of old associations, can scarcely fail to raise a smile on the lips of those who care as little as most men in the middle of the nineteenth century care for shadows whose substance has departed. It is remarkable that to the present day the members returned to parliament by the boroughs of Hastings, Dover, Hythe, and Sandwich, are still termed "Barons" of the Cinque Ports, and that they still claim to exercise, in virtue of the original grant, the honorary office of holders of the canopy over the head of the sovereign at every successive coronation. Their claim as of right to dine, as they dined in olden days, on the right hand of the sovereign at the dinner in Westminster Hall was most ruthlessly and cruelly ignored at the coronation of George IV., when the barons, to maintain and assert their right, refused to give place, or withdraw, and stood (we are told), all the time till the banquet was over, for which act, no doubt, they were subsequently rewarded by the thanks of their grateful combarons, of whose privileges we may literally term them the *upright* representatives.

The jurisdiction of the Cinque Ports, which now extends from Seaford in Sussex to Birchington near Margate, originally embraced a large portion of the Essex coast, and also employed a deputy or bailiff at Great Yarmouth; but they have lately been shorn of these outlying portions of their jurisdiction. The Ports, we should add (except Hythe and Winchilsea), had each several detached "members" assigned to them, as tributaries—not unlike the συντελεῖς πόλεις of early Greek antiquity. Thus, to Hastings were attached Pevensey, Seaford, and part of Bexhill and St. Leonards, together with Beaksbourne near Canterbury, and Granch near Rochester; to Rye was tacked on Tenterden; to Romney, Denge Marsh, Lydd, and Orlestone; to Dover, the towns of Folkestone, Faversham, and Margate, and the parishes of St. Peter, Birchington, and Ringwold; to Sandwich, the towns of Fordwich, Deal, and Ramsgate, and the villages of Walmer, Sarr, and Brightlingsea: but some of the most distant "members" were pruned off some fifty years ago, on account of the many practical difficulties which arose in the administration of justice, and other inconveniences. It is by the several surviving "members" of these Ports that the bailiffs and jurats are sent to the court of the Guestling abovementioned, the court of the Brotherhood being restricted to the mayors of the Five Ports and two "ancient towns," together with a certain number of jurats, thus forming a sort of Upper House.

As may naturally be expected, the list of the Lords Warden of the Cinque Ports includes several names well known in history, including more than one member of the royal family. Since

the office was held by James, Duke of York, afterwards James II. (who, by the way, was married at Dover Castle to Mary of Modena), it has been held by Lord Sydney, Prince George of Denmark, the Earl of Dorset, the Duke of Ormonde, Sydney Earl of Leicester, D'Arcy Earl of Holdernesse, Lord North, William Pitt, the Earl of Liverpool, the Duke of Wellington, and the Marquis of Dalhousie.

It does not appear from the existing records that any of the Lords Warden have been formally installed with a public solemnity since the Duke of Dorset, who was thus inaugurated, in 1765, at the "Bredenstone." Even of this installation there is no authentic record in the public documents of the authorities of the Cinque Ports; and we understand that for the entire programme of the ceremonies performed at the admission of Lord Palmerston, recourse was had to an old newspaper of the day which had recorded the affair with the minuteness of a reporter of our own time. Even "Sylvanus Urban" has placed upon record no outline of the proceedings among his Domestic Occurrences in the "Gentleman's Magazine." As our readers are already familiar with the procession and its accompanying solemnities, we will only ask them to walk leisurely up the western heights of Dover to nearly the top of the "Drop Redoubt," where they will see worked into the wall of the newly-constructed barracks part of the ancient "Bredenstone," of which they have heard so much of late.

This "Bredenstone," or "Kissingstone"—or "Devil's Drop," as it is vulgarly styled by tradition among the inhabitants of Dover—was certainly standing on the western heights in the middle of last century, as it is not only mentioned in his "History of Dover Castle" by Darell, chaplain to Queen Elizabeth (the original of which is in the Herald's College in Doctors' Commons), but a cut of it, as it appeared in 1760, is to be seen in the edition of Darell published at that date. As to the name, the story is, that the good people of Dover thought it was too big a mass to have been made by the hands of man, and therefore somewhat hastily concluded that it must have been the work of the Prince of Darkness.

The masonry of which it is composed is of hard reddish concrete, flint, Kentish rag, and Roman fluted tiles; it was laid upon a platform of flint-work of the same date, and, to judge from its site and from other points, it must have formed the lower portion of a second Roman Pharos, or light-house, corresponding to the well-known Pharos still standing within the walls of the castle on the opposite hill, which is nearly coeval with the Christian era. Such, at all events, is the opinion of a well-known local antiquary, Mr. Knocker, the present worthy town-clerk of Dover, who tells us, in a lecture which he delivered some three years ago, that there is a tradition that a third Pharos of a similar shape and material once stood on the heights above Boulogne. At all events, it is an authenticated fact that this Bredenstone for many centuries was the spot at which the Lords Wardens were installed into their office—the last instance of its use on record, we believe, being just ninety-six years ago. In the year 1808, when the present Drop redoubt was formed, the general in command of the engineers, being more of a soldier than a scholar, and there probably being at hand no local antiquary to rescue it from destruction, and the military authorities, unable to pick it to pieces with axes, tumbled it over on the ground and buried it *in situ*, where it was found a few weeks since. It now forms a portion of the barrack wall, and we hope that ere long a brass plate will be let into the solid masonry, to tell of its past history and of its present and future use—for we suppose that even Lords Warden have no patent of immortality; and, though we trust that it may be a distant day, yet the day must come in due course when the Bredenstone will witness a repetition of the solemnity of the 28th of August, 1861.

Edward Walford.

CADER IDRIS—THE CHAIR OF IDRIS.

I am an old bachelor now, the object of an interest—not, perhaps, wholly unselfish—to my nephews and nieces. Be it so. They will not have long to wait. The one bright thread in the darksome web of my life was snapped, rudely snapped, many a weary year ago, and I am only sorry when a new spring-time comes round and finds me still among the living.

In the autumn of 1829 I was staying in one of the wildest and most secluded districts of Wales, not, as now, a grey-haired, broken man, but young, happy, and rich in friends, in prospects, and, above all, in that elastic spirit of hopefulness that forms the best heritage of those who begin the world. Talglyn Hall, one of those moss-grown stone mansions whose weather-beaten masonry look old enough to be coeval with the eternal hills that overshadow them, was the place of my temporary abode. The Hall—the name of which I have slightly altered—was the ancestral residence of a Welsh gentleman whom I shall call Griffith. I was his friend and guest; indeed we were distantly related, and I was to have been the husband of his youngest daughter. Dear, lost Ellen! with what painful distinctness, after all these years, does her gentle image rise before me, in all the bloom of that youthful beauty on which the hand of Time was never to be laid. I often fancy that she stands beside me as I sit in my elbow-chair, brooding over the past, over the golden sands that ran out so early, and in a strain of faintly audible music, or in the sigh of the summer wind, I fondly dream that I hear the voice of Ellen. Forgive me, reader! I will wander from the point no more, but briefly tell how I won and lost her.

Rambling through Wales during the summer of the preceding year, sketching and fishing, and seeking all the benefit which the pure air and exercise could confer on a constitution somewhat impaired by study and hard work at the bar, a singular whim possessed me. This was no other than to seek out some remote connections of my mother's, who were known to dwell peaceably on their hereditary acres somewhere in the Principality, but between whom and my immediate relatives no intercourse had taken place for at

least a generation. I was shut up by stress of rain in a wretched little inn at Tryssidloes, unable to climb mountains, fish, or take sketches, when a letter arrived from the sister to whom I had written for information. At the point where the four closely-written pages—for postage was, in those times, a costly item—were traversed by what feminine correspondents called "crossings," I found the following sentence :—"The name of the family you ask about is Griffith, people with a long pedigree, of course, being Welsh, and I believe with a grand old house and a good property. They live at Talglyn Hall, at the foot of Cader Idris, so if you go that way you can look them up. It was the father of the present squire who quarrelled with grandpapa, fifty years ago, and mamma says he behaved most *shamefully*, but she has forgotten in what manner. They are, you know, our second-cousins," &c.

On such slight events, to all appearance, do our fortunes depend, that this trivial letter may be truly said to have coloured my whole future life.

I have often tried to speculate on what that life might have been, had my sister delayed writing but a single day more, in which case I should have been gone from the neighbourhood before the arrival of her letter. However, the letter came ; the information it gave reached me at a critical moment, just as I was about to start with post-horses for a more civilised place. It so happened, too, that I was within a few miles of Cader Idris. I could see the blue peak of the steep mountain, looming gigantic through the rain, even from the little window of the inn parlour in which I had been for three days a prisoner. Talglyn Hall must, therefore, be of easy access. I countermanded the post-chaise : I wrote a note, couched in that diplomatic style on which young men plume themselves, and I sent it by a messenger to "Squire Griffith's." Before the long summer day was spent, Mr. Griffith answered the note in person. I found him a capital specimen of the Welsh gentleman—spirited, hospitable, and rather choleric and imperious. But the brighter side of his character was the one most prominent, and that it was which was presented to me. He

greeted me with a frank manliness that put my diplomacy to the rout, and insisted on bearing me off straightway to the Hall. I was his cousin, he said, and quite a near relation in a Cambrian point of view, and I *must* be his guest, in spite of the silly misunderstanding of half a century back. No, no; blood was thicker than water, and he should feel himself insulted if any kinsman came within ten miles of his roof-tree without harbouring there. Thus it occurred that I became a visitor at Talglyn Hall.

Mr. Griffith, a widower, had five children to cheer his hearth, and of these three were daughters. The two eldest were handsome enough, but Ellen, their younger sister, then scarcely seventeen, was as beautiful and winning as a fairy. No wonder that I admired her. Admired is a cold, pale phrase. She was born to be loved, and I loved her with a deep, strong love over which time has never gained the mastery. I do not wish to linger on that happy period of alternate hope and fear, of broken words eked out by glances, and all the petulant changes of passion. Suffice it that my love was returned at last, and that before my long visit was at an end Ellen had plighted me her simple troth. I went honestly to Mr. Griffith, and told him all. He was not displeased. He appeared, in fact, hardly to be surprised. Lovers, indeed, are generally very transparent in their wily stratagems for hoodwinking the world, and even the most guileless household is speedily aware of the progress of an attachment. But Mr. Griffith, though not averse to receiving me as a son-in-law, was not willing that his daughter should marry at seventeen, and was besides desirous that time should test whether we, the principal parties in the case, really knew our own minds. We both thought this decision very tyrannical and absurd. I am sure that it was right, and kind, and wise. For a year Ellen and I separated. I was to work heartily at the bar, as before; the Griffiths were to travel, to visit watering-places and cities, and to vary their usual retired mode of life, in order that Ellen might see something of the world before she irrevocably fixed her fate in it. And, if all went well, and we young people continued of the same opinion, after the lapse of a twelvemonth, why then—

Then! How cruel seemed the suspense and the banishment; how certain that our sentiments would be unchanged a year hence, fifty years hence, my younger readers may ask their own hearts. We obeyed. I not only obtained some credit as a rising junior at the bar, where I already possessed a certain footing—more due, I dare say, to circumstance than merit—but I won the consent and approbation of all my relatives to the match. I was not dependent on them or on my profession for support, but Squire Griffith was a great stickler for such matters, and he was not easy until I had induced my mother to write him a letter solemnly abjuring the feud between their parents—the reason of which had been, I believe, a dispute at long whist—and consenting formally to the marriage. And now the weary waiting was over, the year was out, and I was at Talglyn Hall again to claim my bride. All went smilingly with us. Ellen had the old loving look in her dear blue eyes; she had been courted and flattered, but no one had been able to win away her heart from me, and the Squire admitted that never had a probation turned out more satisfactory than ours. All the family were kind, warm-hearted people; they welcomed me cordially among them; they were willing to hail me as a brother, though they *did* grudge a little at times that I should rob them of the light of their home, the darling of them all, for Ellen was both. She had been very pretty a year before, but had now expanded like a flower, and was as sweet a type of the more fragile order of womanhood as ever existed. I was surprised to see how much she had developed in so short a time, but she loved me none the less for the greater experience of life which she had gained in the past year. Our wedding-day was fixed; the preparations were nearly completed, and my sisters, who were to be bridesmaids jointly with Ellen's sisters, were shortly expected at Talglyn. And now but a few days intervened between me and the crowning happiness of my life—that happiness which was never to be.

I have painted nothing as yet but a picture of hope and happiness, a sunny sea and white-sailed pleasure-barks gaily gliding over the soft summer waves. Now comes the blacker sketch of wreck and storm. Ellen had one fault, if fault be not too harsh a word, one flaw in her nature. She had a pretty waywardness, an impatience of contradiction that never degenerated into peevishness, never became imperious, but which in one endowed with a less sweet temper would infallibly have done so. As it was, it rather took the form of a half playful defiance, so winning, so full of grace, that you could scarcely have the heart to wish it away. But there *were* times when Ellen's petulant caprice became a source of terror to those who loved her best. I have known her persist in maintaining her seat on a plunging, kicking horse, full of vice and mettle, and which exerted every sinew and every artifice to hurl from the saddle its slender but unconquerable rider. Equally, I have seen her run, mocking our cowardice, along the trunk of a fallen tree that bridged a cataract, slippery though that tree was with the washing of ceaseless spray, and perched at a fearful height above the ragged rocks and the dark pool below. And in a mountain excursion, no one, not even her daredevil young brothers, ventured so close to the most dangerous precipices as Ellen did, laughing the while. Yet she was no Amazon, but when the whim was over, showed all a girl's timidity in face of peril; it was contradiction that nettled her to rashness. One evening, after a happy day spent partly on the hills and partly in boating on the little lake, the conversation turned, somehow, on the superstitions of Wales. One legend called forth another, and none of her relatives had such a store of these weird tales as Ellen, or told them so charmingly and simply. At last she related a particular story which I have but too much reason to remember, which has burnt into my brain like a fiery brand, the story of the Lady of Cader Idris. The legend has reference to the Welsh proverb, so old, that it is

by some considered anterior to even Merlin, that "he who spends a night in the chair or Cader Idris will be found mad, dead, or a poet." Tradition relates that Merlin sat there, and that Taliesin also went through the dread ordeal that touched his lips with the fire of prophecy.

"You know," broke in young Herbert Griffith, "the gap cut in the live rock, on the high peak where the cairn is, just above the cliff? It looks like the throne of some queer old king. I showed it to you when we went shooting dotterils. Beg your pardon, Ellen!"

Ellen went on to relate how, long ago, in the thirteenth century, the lady of the manor, a beautiful and wilful heiress, called by her vassals the Lady of Cader Idris, had resolved to undergo this terrible trial in the hopes of becoming imbued with the spirit of poetry. How, being a lady of rare courage and headstrong will, she had persisted in her resolve, in spite of the entreaties of her kindred, the prayers of her tenants, and the authority of her confessor. How she had gone up alone to the haunted hill-top, where, as legends tell, spectres keep a world-long watch over buried treasure, and had faced storm, and darkness, and all the terrors of the visible and the viewless. Finally, how she had been found in the morning, stark and dead, seated in the rocky throne on blue Idris, with her long dark hair floating over the stones as she sate in an attitude that mocked life, and with an expression of awful fear stamped on her open eyes and fair pale face. The tradition added that, on account of her rebellion against the priest's commands, the pitiless church had denied her poor body Christian burial, and that she had been laid, in silence and stealth, by the hands of sorrowing kinsmen, under a cairn of loose pebbles on the hill-top.

Then Ellen went to her harp, and sang us first the wild Welsh ditty that some bard had composed in elder days, and then the polished verses which Mrs. Hemans had penned on the same theme. Nor was it till the last notes of the harp and the sweet voice had long died away that we recovered from the impression of the weird and mournful tale, and began to question its authenticity and to challenge its probability. I remember we all took part, in a sportive way, against Ellen and the legend. Our wish was, no doubt, to tease, harmlessly, the darling and spoiled child of the household, and also perhaps to atone to ourselves for having been for a time more completely under the spell of romance than we cared to acknowledge. But to start a discussion is like rolling a stone down-hill. It starts gently, sliding down grassy banks and springing daintily from mound to mound, then leaps with huge bounds, gaining force every instant, till it thunders from crag to crag, and crashes into the valley below. Our controversy grew warm and lively, almost bitter. Ellen was piqued and ruffled. She had told us one of her favourite tales, one which she had loved and dwelt upon, and which was grown to be almost a part of herself, and we had listened—and laughed. She had not the experience that riper years impart, and which would have made her suspect that our derision was in a measure defensive and over-strained, and she was vexed, and showed it. She was quite angry with her jeering brothers, but I came in for the full weight of her indignation.

"Why was I incredulous? Did I think woman's nature so frivolous and cowardly that nothing brave or self-devoted could be looked for from a woman?"

To this I replied, with provoking gravity, "That I thought the story a pretty one, but that it was as improbable as the adventures of King Arthur and his knights, and that I never saw or heard of any female capable of confronting so much risk and discomfort." Finally, I declared the "Lady of Cader Idris" a pure invention of some crack-brained harper. Ellen's scornful eyes flashed, and she tossed her golden ringlets as she turned away. All might have gone well had not some mischievous fiend whispered to me to improve my victory. So I did. I waxed very witty and satirical, and the company applauded, all but the squire, who was asleep, and Ellen, who stamped her little foot angrily on the floor, exclaiming:

"I will show you that a woman dares do more than you fancy. I will go through this ordeal, that you believe impossible. We shall see who is right, you or I."

And she left the room at once. When she came back, half an hour later, she was quite calm and unruffled: she joined in the conversation as usual, and spoke pleasantly of the projects for pike fishing in the Llyn, for a late pic-nic to some celebrated point of view, and a ride to the county town. But there was a feverish restlessness in her air, and she broke off rapidly from talking on one subject to diverge to another. She sat down, when asked, to harp or piano, but she played but a few bars, and then rose again, saying she could not remember a tune. This change of manner caused me some concern, and I went up to her, and said in a low tone:

"Ellen, are you ill?"

"Ill? No," she answered, in an abstracted manner, and moved away.

"You are not offended with me?" I began. "I did not mean—"

"No, I am not offended," she answered, with some constraint, and then began to take the keenest interest in the artificial flies Herbert was tying.

We exchanged no other word until every one had retired to rest, and it came to my turn to wish her "Good night," as usual. She took my hand between her own little white fingers, and for a moment gazed in my face with a strange look that has haunted me ever since—that will haunt me to my dying hour. Sorrow, reproach, affection, and an under-current of firm but hidden determination, were blended in that glance,—the *last* that I ever received from those fond blue eyes that I had hoped would be a sunshine in my home from youth till age. And her lips murmured the old trivial phrase, "Good night," as if it had a new meaning. She turned away.

"Ellen!" said I, springing after her, "one moment, Ellen!"

She did not seem to hear. She glided from me, and was gone. One moment I stood irresolute.

False pride made me ashamed of my anxiety. Even then, after the loss of one precious moment, I should have followed, but the Squire called to me, candle in hand, from his study door, to say something about to-morrow's pike-fishing, and the opportunity was lost—for ever! What might not then have been the magic power of one word of real kindness and contrition?—it might have altered the whole current of an existence.

That has been one long and unavailing regret. But the word remained unspoken. I went to my chamber, a quaint room in one of the wings, close to the gray turret where, beneath its conical roof of slate, the alarm bell hung. I slowly undressed, often drawing aside the curtains, often peering forth through the Elizabethan casement of diamond panes, many of which were darkened by the heavy growth of the rank ivy without. All was ghostly still in the garden below, where the stiff hedges of clipped holly, the terraces fringed with box-trees and hornbeam, and the broad, old-fashioned walks were white with moonshine. An owl was hooting in the wood, and the mastiff in the court-yard bayed mournfully from time to time, and rattled his chain. The moon was high and bright, but black clouds were sailing across the sky; and as I looked, a sudden glow lit up the horizon, as if a trap-door had been opened above some fiery gulf, then vanished as quickly. "There will be a storm to-night," I muttered, as I turned from the window for the last time. I was very ill-satisfied with myself, and, as often happens, I perversely chose to justify my own conduct by blaming poor Ellen. "She had no right to be so positive and so petulant," I said to myself. It augured ill for our future happiness that she should resent idle words so deeply. But in the morning I would speak to her, reason with her—in the morning? We are blind, blind!

My prediction that there would be a storm that night was fulfilled to the letter. A storm there was. I was awakened by a peal of thunder that sounded in my sleeping ears as if the trumpet of the archangel were calling sinners to judgment. Crash upon crash, roar upon roar, till the vault of Heaven was full of the giant sound, and the strong stone mansion rocked like a living creature in fear. The blaze of the lightning, broad and bright, flooded the whole sky with an incessant lurid red, and between the stunning bursts of the thunder might be heard the howl of the wind and the hurtling of the hail and rain. An awful night. A night for shipwreck and ruin, and death of travellers on lonely moorland roads, and toppling down of gray steeples that had mocked at the gales of centuries. A grim, wild night. Presently the thunder died away, all but a sullen growl afar off, and the flashes ceased, and rain and wind went on lashing and tearing at the casement.

I fell asleep, and a strange dream I had. I dreamt of the high peak of Idris, with its storm-lashed terrace of mossy stone, the cairn of loose pebbles, and the rocky chair, deep cut in the very brow of the horrid cliff, with a yawning precipice below. And the chair was not empty. No. It had a tenant, and that tenant bore a female shape. I could see the white robe fluttering through the blackness of night, and the loosened hair, and the hand that was pressed to the eyes, as if to shut out some ghastly sight of things unspeakable, while its fellow grasped the rocky rim of the throne. Then the thunder bellowed over head, and the lightning flashed in fiery forks and hissing zigzags, ringing the hill-top with a flaming diadem, blazing, red and menacing, through the abyss below, and illuminating with a dreadful light that solitary form, alone amid the wrath of the elements. The tempest broke in its might upon the peak of Idris; hail, rain, wind, swept the mountain as with a besom, and the pale form in the fantastic chair endured them all. Strange, unearthly shrieks were blended with the howl of the wind; wild and dismal pageants trooped by amid the driving mists and sheets of blinding rain; and by one last glare of the lightning I saw the figure remove the hand that hid its face. The face of a young girl—of Ellen!—but so ghastly with terror, so full of agony and nameless horror, that I awoke, trembling and unnerved, with great heat-drops on my forehead, such as excessive bodily pain might have called forth. The storm still raged, but more feebly. Yes, it was subsiding now. I sank back again, but this time into a heavy, dreamless slumber. I woke in the golden, brilliant morning: the sky was blue, the birds were singing gaily, and the verdure of the country seemed fresher and fairer than before the storm. My spirits rose as I dressed; I was in the best of tempers, and I made a resolution that I would not chide Ellen for her wilful conduct of the preceding evening, but would be very considerate and kind, and would even say I was sorry to have hurt her feelings by a careless word. I went down to the breakfast-room. The Squire was there, with his two elder daughters and his eldest son, while young Herbert came in with his fishing-rod a moment later. But no Ellen. The old butler brought in the urn, after we had exchanged a few remarks, and then, for the first time, Ellen's absence was commented upon.

"She is not usually the lazy one," said her father. "Owen, send up Miss Ellen's maid to let her know we are waiting breakfast."

The man went. We chatted on. But Owen came back with a blank look to say, that the maid had found the door locked, and that she had knocked repeatedly, but without getting an answer.

This astonished us all.

"She must be ill!" cried Charlotte, the eldest sister, hastily leaving the room.

Soon she, too, came back, to say that she had called aloud at the door, but that Ellen would not reply a word.

"Perhaps she has gone out;" said Herbert. "The window in the oratory that opens out of her room leads right on to the terrace by the greenhouse, and then there are steps to the garden."

"Nonsense," said the Squire, knitting his brows, "that door has been locked these fifty years, and the key lost, too. I'll go myself. I'm afraid she is ill."

We all went up in a body. Two or three of the servants were on the landing place.

"I am afraid, sir," said the lady's maid, half crying," something's amiss. We can't hear a sound. It's all as still as death."

Something painful shot across all our minds as we heard this speech.

We neared the door, the Squire tapped.

"Ellen! Ellen, love! answer, my darling; are you ill?"

No reply.

Mr. Griffith set his strong shoulder against the door, and by a violent effort, dashed it in. We entered. The room was tenantless,—empty.

"She *has* gone out, after all!" cried Herbert, running to the old oratory, and pointing to the long disused door, now wide open.

"Miss Ellen must have gone out last night," stammered one of the women, "for the bed has not been touched."

Last night! In the storm! Impossible. Yet on tracking farther we found on the terrace a bow of riband, drenched and heavy with moisture. It had evidently been dropped by its owner, and all recognised it as Ellen's—on the previous night, before the rain began.

"She must be mad, my poor, poor child," groaned the Squire, "or is she playing us a trick? No, she never could have the heart to trifle with us in such a way."

Suddenly a horrid thought flashed across my mind. My dream! the dispute of the previous night—the strange resolve latent in Ellen's face as she took leave of me—all these came crowding back.

"I know where she is;" I cried aloud. "I know it but too well. She is on the mountain, on Cader Idris, dead or mad by this, and I am the accursed cause."

"My poor fellow, your anxiety makes you talk wildly," said the Squire. "Cader Idris, how can she be there? Impossible!"

"She *is* there," cried I, in an accent of agonized conviction that none could resist, "she spoke of going through the ordeal of the rock-chair last evening; and I, fool that I was, have slept while she was perishing in the tempest. Follow me, and waste no time. For Heaven's dear love be quick, and bring restoratives, if in mercy it be not too late!"

My vehemence bore down all opposition. In less than five minutes we were hurrying to the foot of the mountain. But I outstripped them all. My heart was on fire, and my feet were gifted with unusual speed. Up, among the slippery shale and loose stones, up by bush and crag, by rock and watercourse, and by tracks only trodden by the goat, and I stand panting on the terrace, a few feet of peak above, a yawning precipice below. My dream was too terribly realised. There, in the rock-hewn chair, in her muslin dress and mantle of gay plaid, both of them drenched and stained with rain and earth, lay Ellen, cold and dead. Her long fair hair half-hid her pale face, and her little hands were tightly clasped together. I clasped her to my breast; I called wildly on her name; I parted the dank hair that hid her face, and on it I saw imprinted the same agony of fear, the same dark horror, as in my fatal dream. But she was dead, my dear, dear Ellen. And I think my heart must have broken then, as I saw her, for ever. Since that day the world has been a prison to me. JOHN HARWOOD.

A "MEDIUM" IN 1772:

BEING "AN AUTHENTIC, CANDID, AND CIRCUMSTANTIAL NARRATIVE OF THE ASTONISHING TRANSACTIONS AT STOCKWELL, IN THE COUNTY OF SURREY, ON THE 6TH AND 7TH DAYS OF JANUARY, 1772, CONTAINING A SERIES OF THE MOST SURPRISING AND UNACCOUNTABLE EVENTS THAT EVER HAPPENED; WHICH CONTINUED, FROM FIRST TO LAST, UPWARDS OF TWENTY HOURS, AND AT DIFFERENT PLACES. PUBLISHED WITH THE CONSENT OF THE FAMILY, AND OTHER PARTIES CONCERNED."*

Does any one remember the "Stockwell Ghost?" The world was less scientific and more gullible, perhaps, ninety years ago, than it is at present; but yet certain "surprising and unaccountable events" which it records in these days seem so suggestive of Stockwell redivivus that I have hunted up the story; from pages damp, good reader, not with the delightful dampness of your uncut serial, but with the damp of years,—all covered with yellow blotches.

The "astonishing transactions" were as follows:

On Twelfth-Day, 1772, a certain Mrs. Golding was in the parlour of her house at Stockwell when she heard a noise of falling glass and china in the kitchen, and her maid, who had been in her service but a few days, came to tell her that the stone plates were falling from the shelf.

Mrs. Golding went out, and immediately noises began to be heard all over the house; a clock fell down and was shattered, a lantern tumbled from the staircase and smashed itself, and an earthen pan started in pieces, and its contents were scattered about the floor. The noise attracted several persons to the spot, one of whom, a carpenter, gave in his opinion that the foundations of the house were giving way. Mrs. Golding ran into a neighbour's house and fainted. When she came to herself, being still weak and faint, a surgeon was desired to bleed her, which he did—rather a questionable remedy for weakness—and the blood, in a congealed state, sprang from the basin to the floor, the basin breaking to pieces. A bottle of rum, at the same time, made shipwreck of itself. In the mean time the bystanders, for fear of the catastrophe foretold by the carpenter, were busily engaged in removing Mrs. Golding's effects to the house in which she herself had taken refuge. It soon became evident, however, that some agent, more mysterious and horrible than a yielding foundation, was at work. A pier-glass wrenched itself from the arms of the man who carried it and fell, smashing itself. It was pushed under a sideboard, and immediately a scene of destruction began above it. Glasses, jars, cups, and bottles danced over each other and into each other in a furious manner, many of them springing to the ground in fragments. Some one being asked to take a glass of wine or spirits, both the indicated bottles flew in pieces before they could be

* Title of an octavo tract, "printed for J. Marks, bookseller, in St. Martin's Lane, 1772."

touched. Mrs. Golding's surprise and fear became intolerable. Seeing that wherever she and her maid went, these strange, destructive circumstances followed them, it could not be expected that the neighbours would receive such certain loss into their houses; and what was to become of her? It is to be remarked that though the servant of the unhappy lady was the only person who expressed no terror, yet she was constantly walking about, and could not be persuaded to sit still.

Mrs. Golding next took refuge in the house of her niece, a Mrs. Pain, sending her own servant back to see what went on at the house which was *not* falling. During the absence of the servant—Ann Robinson—all was quiet, but soon after her return to her mistress a fresh scene began. First a whole row of pewter plates fell from a shelf to the floor, rolled about a little while, then settled, and as soon as they were quiet, turned over. Being replaced, they repeated the performance, after which a second row perpetrated the same feat. An egg, which stood on one of the shelves, flew off across the kitchen, struck a cat on its head, and then broke to pieces. A pestle and mortar next jumped from the high chimney-piece, followed by the candlesticks and all the "brasses," till nothing remained on the shelf. Mrs. Pain and her servant then put the glasses and china on the floor, thinking to save something; but the spirits laughed at such a precaution, and a tumbler immediately jumped up about two feet, and was broken. Another followed the example; then a china bowl, and a tumbler, with rum and water in it, jumped about ten feet, and was shattered. Next, a mustard pot flew out of a closet in pieces, and a single cup that had been left on the table jumped up, flew across the kitchen, ringing like a bell, and dashed itself to pieces against the dresser. Then the table itself began to dance. It did not use its claws after the fashion of quadrupeds, as some tables do in these days to climb upon sofas, &c.—perhaps it had no claws—but it put itself into sundry unnatural positions before it could be induced to lie quiet. A ham then raised itself from its hook, and fell to the ground. Some time afterwards another one performed the same feat, and a flitch of bacon brought up the rear.

Several of Mrs. Pain's family were reduced to such a state of terror that they could not stay in the house; but Mrs. Golding's servant, Ann Robinson, was perfectly composed, and continued walking backwards and forwards in a ghostly manner, entreating her mistress not to be alarmed, as these things could not be helped. This curious way of viewing the matter, added to the fact that whenever Ann Robinson was absent the manifestations ceased, caused her to be looked upon with mingled dread and suspicion; but, since she was never seen near any of the falling objects, it was evident that if she had anything to do with the transactions, her power must be supernatural.

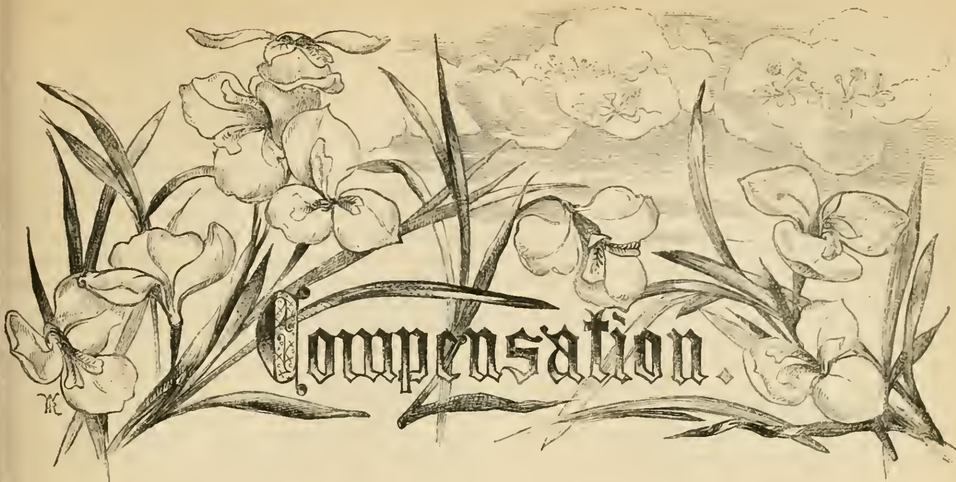
The noises and destruction, however, continued at intervals during the night, till there was not more than a cup and saucer or two remaining to the unfortunate Mrs. Pain. About five o'clock in the morning, Mrs. Golding declared that she could remain in that house no longer, and went over, desiring her maid to follow, to the house of a Mr. Fowler.

As usual, nothing happened there until the appearance of Ann Robinson, on which, however, the unaccountable disturbances began again; and the maid, going privately to Mr. Fowler, warned him not to let her mistress remain there, as wherever she was, the same things would follow. Mr. Fowler then, fearing greater loss, requested Mrs. Golding to leave his house; first begging her to consider whether she had not been guilty of some atrocious crime, for which Providence was determined to pursue her on this side the grave.

Mrs. Golding replied that her conscience was clear, and she would not stay in his, or any other person's house any longer, but would go back to her own. Mr. Pain went with her, Ann Robinson, of course, being of the party. As soon as they arrived, a pail of water began to boil, like a pot on the fire; a box of candles fell down from a shelf, and a table began to move, and fell down. Mr. Pain then sent Ann Robinson for his wife; during her absence nothing happened, and on her return she was immediately discharged. And there ended the disturbances. Some few, pertinacious and disagreeable persons, ventured to suggest that Ann Robinson might be able to explain the affair in a natural manner, but they were hissed down. If she had anything at all to do with it, then she must have had means at her command of which ordinary mortals know nothing. It was decided that the animation of inanimate crockery, furniture, &c., could not possibly have been effected by human means.

For the satisfaction of such, for instance, as the narrative probably and sneeringly alludes to as being "so ready to discover natural causes for everything," it may be added that some years after the astonishing transactions, and when the Stockwell Ghost had begun to fade and be no more heard of, this same Ann Robinson made a private confession to a gentleman capable of enjoying a practical joke even when it bordered—as this certainly did—on downright wickedness. She put long horsehairs to some of the crockery, and wires under others; on pulling or touching these of course the moveables fell. When she saw the effect of her first feats she was tempted to exercise her dexterity beyond the original purpose for mere amusement. She loosened the hams and bacon, attaching them by the skins, which soon gave way; and she threw a chemical powder into the pail of water as she passed, after which it bubbled. She managed to throw down several articles with her own hands, and when the victims turned and saw them broken or in motion, they attributed it to unseen agency. In short, the only magic was the dexterity of the supposed witch, and—a very large feature in the case—the alarm of the spectators, whose terror at the time, and their conversations afterwards, magnified many of the circumstances and invented others, and who were too full of their own dread of supernatural agency to be capable of examining anything, or even of a moderate degree of observation.

Louis Sand.



"Have you daisies in Tasmania?"—English Letter.

No, dear—on neither lawn nor hill,
Nor in our forest mazes,
Dwell those child-lovèd flowers of home
Your bright-eyed English daisies.

I used to wish my babes could play
About your grass-plot mossy,
With king-cups strewn upon their hair,
As golden and as glossy :—

Or sit beneath your trellised bower
Where the roses bloomed so early,
Weaving long strings of daisy chains,
Gold-boss'd, pink-tipp'd, and pearly.

I vainly craved that they should feel
Your fond and warm caressing,
And share the love that thro' long years
To me brought priceless blessing.

Oft have I counted o'er my lost,
With tears of wistful sorrow;
And, full as oft, new happiness
Brought smiles upon the morrow.

Now, 'tis my Faith, for one denied,
Another boon is given;
If we have fewer stars on Earth
We have a brighter Heaven.

For daisies we have lilies* sweet,
And, for the city's riot,
The silence of untrodden hills,
Folded in sunny quiet.

Near one (now long-left) sea-side home,
I lovingly remember
The glorious wealth of lily-blooms
In summer-crown'd December.

And still, their perfume (like the mists
Of fragrant incense, stealing
Around a wizard's mirror'd scene,
Distance, or death revealing)

Shows softly to my memory, how
One summer-eve, we rambled
Along the beach, and o'er the cliffs,
And how the children scrambled!

And where we sat upon the rocks,
While the drowsy air was bringing
Adown the shady inland slopes
The she-oat's plaintive singing.

The blue, bird-dotted sea, asleep,
Murmur'd its dream-thoughts inly;
And on its ever-heaving breast
Cloud-shadows lay serenely.

Three sister-islets in the bay
With lichens many-tinted
(Like painter's palette freshly set),
In sunset splendour glinted.

Five silv'ry lights were on the sea,
'Twixt shore and islets floating :—
"An argosy from fairy land!—
Titania, out a boating!

"The white sails flap, and furl away—
The prows are like old galleys—
"All imaged in the glassy deep
That softly round them dallies."

Ah! see—while we with idle dreams
People the scene entrancing,
Five pelicans are rising, where
The mullet-shoal is glancing!

With grey and silver plumes up-borne,
And well-provisioned pouches,
Our stately neighbours wing their way
Off, to their beach laid couches.

"Now, children—home! The sun has set,
The evening breeze is chilly :—
Alas! I fear you have not left
A single summer-lily!

They laugh, and point :—I cannot miss
(So bountiful the treasures)
The many handsful that have gone
To yield the evening's pleasures.

* One of the most universal Tasmanian flowers is the native lily (*Diplarrhena Morea*). It especially frequents poor sandy soils, where the great tussocks of its long reedy leaves, and, in early summer, the abundance of its Iris-shaped, fragrant, silvery-white blossoms form a distinct feature in the monotonous bush landscape.

Still, constellated thickly, gleam
The lilies, sweet and shining :—
Still, tho' of some bereft, our lives
Have blessings past divining !

No ! we've no "daisies-pied" to pluck,
No cowslips, to make wine of !
We see not e'en the blessed stars
Our childhood loved the shine of.

I yearn for distant dear ones here,
For old-world art and beauty :—
But guardians twain still cheer my heart,
God's love—and Woman's duty.

That, sheddeth mercies o'er our path,
How far beyond deserving !
This, bindeth with content, the thoughts
Too prone to errant swerving.

Be sure, for every bliss denied,
Some other good is given.
If we have not your stars of Earth,
We have a sunnier Heaven !

L. A. M.

AN ARTIST'S RAMBLE ALONG THE LINE OF THE PICTS' WALL.

PART V.

In the evening we returned to the Shaw's, which we reached just as the bell commenced ringing for supper. At six the next morning we joined a party of early-risers, and descended to the bed of the Irthing, which here pursues its course between walls of lofty crag, beautifully interspersed with foliage, where, in my earlier acquaintance with the place, there was a large heronry, but the herons have taken flight, and now only an occasional straggler is to be seen. We drank a draught of the Spa water, whose virtues attract numerous visitors to Gilsland, although, I believe, as many resort thither for the enjoyment of pleasant relaxation, social intercourse, and a fine atmosphere and beautiful scenery. We found our draught a leetle flavoured with sulphuretted hydrogen, but potable enough. I was told that, after awhile, the drinker acquires a taste for it, and tea made with this water is much esteemed by the initiated. I was not unmindful that it was at Gilsland that Scott first met with his wife, then the beautiful Miss Charpentier, and the spot where he put the "momentous question" is said to have become a favourite resort of fair spinsters in their rambles with the Gilsland beaux. The very stone even on which Miss Charpentier sat on the interesting occasion is identified ; it is called the "Popping Stone," and many fragments are chipped from it, as amulets propitious to Hymen, for, like the stone on which St. Thomas of Canterbury received the crown of martyrdom, its virtue exists with equal potency in the smallest fraction as in the whole mass. When I inquired the way to this hallowed spot, I was told that the etiquette of the place did not admit of a gentleman undertaking to guide thither one of his own sex, but that I might be sure of finding some fair one haunting the confines of the Gilsland "Caaba," like an unquiet spirit ; which proved true,—for crossing the stream by stepping-stones in the direction of Wardrew, near to which I knew was the goal of my pilgrimage, I fell in with a young lady, as predicted, taking her way

In maiden meditation fancy free,

who, on my modest representation, willingly undertook the office of guide ; and, truly, Miss Charpentier could hardly have listened to the poet's vows in a fairer or more secluded scene. The large stone which constituted her resting-place is chequered by the shadows of a mountain-ash that grows on the brink of the clear swift stream, whose course narrows here between steep embowered banks, where the cooing voice of the cushat-dove mingles with the murmur of the waters, as, gliding over many a rocky ledge, they flow in music that the fairies in their moonlit revels might not disdain to dance to. Leaving the quiet scene with an aspiration that it might hear many repetitions of the whispered "Yes!" to be succeeded by as many happy marriages, I hastened on my return to the hotel, the more especially as the breakfast-bell seemed in its importunate clang to be enumerating the various materials of tea, coffee, ham—broiled in rashers, and cold on the sideboard, blushing beside the mighty round of beef—trout, kippered salmon, eggs, muffins, toast, bread, white and brown, and creamy butter, moor honey, marmalade, &c. &c., which go to make a substantial north-country breakfast. I therefore offered a hasty arm to my fair guide, who engaged to take a chair next me at the table, in order that we might carry on the staid and edifying conversation upon which we had entered, and which was now rendered incoherent by the sacred rage of hunger. Having partaken of these restoratives with a zeal and perseverance that might have proved not unworthy even of a holier cause, half-an-hour was devoted to a pleasant saunter in the garden, after which, accompanied by Captain B——, honorary master of ceremonies, and Mr. Tom C——, the Yorick of our party, we took an upland stroll to see the muircock rise on the wide waste of heather which stretches away to the confines of Bewcastle.

On the edge of the moor our notice was directed to a stone bearing the inscription DR. MOUTH ; inquiring the meaning of which, I was informed by Mr. Tom C——, that the virtues of the Gilsland waters were discovered, some century ago, by a certain Dr. Mouth, who made the place his residence, and, dying there, ordered his remains to be interred on the moor, and a stone simply inscribed with his name set up to mark the grave. This satisfactory explanation given, we proceeded a few steps—and, lo ! another Dr. Mouth.

"What!" I said, "was your eccentric doctor buried in two places, then ?"

"His son," said C——, "Dr. Mouth, Junior, who succeeded to his father's practice, and evinced an hereditary taste in respect of the mode of his burial."

I was warned by the corner of H——'s eye, but too late, as he enunciated the words "Drainmouth," with solemn emphasis on the word "drain."

"Sold again !" shouted the Captain and Mr. Tom C——, with great hilarity ; and it was only when they had sobered down into ordinary deco-

rum that I learned the cost of my bargain—being the forfeiture of a bottle of wine at dinner. A number of "sales," I was told, were effected during the season, and the article was always offered to new-comers, who, in three cases out of four, readily "bid" for it, and thus found occasion for paying their footing. A circuitous ramble brought us to a small ancient-looking house with a steep thatched roof at the foot of the hill on which the hotel stands. This is the Mumps Ha' of "Guy Mannering." Scott's description tallies with it precisely :

> The alehouse, for it was no better, was situated in the bottom of a deep dell, through which trilled a small rivulet. It was shaded by a large ash tree, &c.

The buxom but treacherous Meg, the landlady of Scott's story, is drawn from one Margaret Carrick, whose gravestone, the inscription nearly obliterated, being headed Mumps Hall, I found lying face downwards in the churchyard of Upper Denton, near Burdoswald.

Returning to the Shaws we wiled away the time till dinner at quoits, being not a little entertained by the apparition of a meek old man who played the Northumbrian pipes to the good old tunes of "Fenwick o' Bywell," "Kittle her Chin with a Barley Straw," "Caller Fair," "Wylam awa'," "Penton loaning," &c. &c., attended by a dog, who, squatted on his haunches, howled a dismal accompaniment. Next morning, my companion and I resumed our pilgrimage, getting a hearty cheer from the company of the hotel who were assembled at the door to bid us good speed. Descending the hill, our conversation ran upon Scott and his association with the scene we had just left, and whose masterly touches have given an additional charm to its natural beauties. Besides the passages in "Guy Mannering," there is much in the story of "St. Ronan's Well," that has evidently been inspired by Gilsland recollections. It was in the prime of youth and at the dawn of his poetical career when he first became acquainted with the place, and he may well have

The Popping Stone.

The Piper.

looked back to it as the scene of some of his happiest hours. Here were penned the verses

TO A LADY WITH FLOWERS FROM THE ROMAN WALL.

> Take these flowers, which, purple waving,
> On the ruined rampart grew,
> Where, the sons of freedom braving,
> Rome's imperial standards flew.
>
> Warriors from the breach of danger
> Pluck no longer laurels there,
> But they yield the passing stranger
> Wild-flower wreaths for beauties' hair.

Tracing the line of the wall by slight indications we arrived at Hare Hill, where its highest existing fragment appears, standing nine feet ten inches in height ; but, deprived of its facing-stones, it might, to the inexperienced eye, appear rather a mass of crag than a piece of human workmanship. The wall now stretches away towards the river Eden, visible only by ridges in the soil, which indicate its course till we reach the rivulet called Burtholme Beck, where a portion appears, about seven feet high, embowered by hazels and dwarf oaks. At Wall Fell indications of a double barrier or outwork are observable. Crossing the hill at the farmhouse of Dove Cote, the foundations of the wall and fosse are seen, and at Walltown some indications of a camp are likewise visible. Along this part of the line the abundant spoils of the wall are to be observed in the farm buildings and cottages. At Sandysike farmhouse a barn is composed entirely of Roman stones marked with the diamond broaching, and in the garden wall there are several sculptured stones ; one of these, a Roman eagle, nestles among the foliage of a pear-tree trained over the wall ; and another, bearing the wheel of the swift avenging Nemesis, threatens the sensual tenant of a pigstye with the penalties of the carnificial knife and the purgatorial lustration of the smoke-rack. Castlesteads, which contests with Cambeck Fort the claim to represent the Petriana of the Notitia, like Caervoran, lies to the south both of the wall and the vallum. Its site is now almost obliterated. Several altars and sculptured stones have been found, and are preserved at Walton House, the garden belonging to which usurps the site of the station. Coins of Julia, the second wife of Severus, Bassianus, com-

monly known as Caracalla, and of his brother, Geta, have been turned up by the spade. About four miles hence, on the rocky banks which overhang the river Gelt, at Helbeck Scar, some inscriptions, popularly known as the Written Rocks, are visible—probably the record of the Roman quarryman—but they are barely intelligible, as I am informed, for I have not seen them myself. Crossing the Cambeck Water, we reached Hurtleton (the Town of Strife), where, in the nook of a field, called Chapel Field, are the remains of a mile-castle, and further on, within a quarter of a mile of Old Wall, the site of another appeared. To the west of Bleatarn the land subsides into a considerable morass, to avoid which the vallum takes a wide sweep. Half a mile south from Bleatarn is the site of a camp called Watch Cross, which was conceived by Horsley to be one of the stations on the line of the wall. If it be so, it corresponds, in point of succession, with Aballaba, which was garrisoned by a *numerus*, or troop, of Moors under a prefect. But the identity of this station is doubtful. The paucity of inscriptions leaves the means of identifying the succession of camps on this side of Amboglanna very much an exercise of vague conjecture. Whether a stationary camp on the line of the wall, or a mere summer encampment, Watch Cross, which is said by Horsley to have been the least station on the line, no longer presents to the eye a feature by which its site can be recognised. From Bleatarn the course of the barrier is difficult to trace by Wall Head, Walby, and Wall Foot (the names, however, furnish points of guidance), to Tarraby, from which village to Stanwix (Stone Wicks) a road runs upon the foundations of the wall.

From Stanwix we look back over a considerable portion of our preceding route, to where the Nine Nicks of Thirlwall bite the horizon with their acute fang-like peaks. To the south and south-west the eye wandered with pleasure over the grounds of Rickerby, and the rich course of the Eden passing the ancient towers of Carlisle, the Cumbrian mountains rising in the distance blue and sharply defined. The church and churchyard of Stanwix are planted on the site of the station. In pulling down the old church a fine figure of Victory, now at Newcastle, was found. On Castle Bank, the north bank of the Eden, opposite Stanwix, the foundations of the wall are distinguishable; but from this point we lose all traces of it until its track is again discerned just beyond the suburbs of Carlisle, where it becomes faintly discernible. At Carlisle—the *Luguvallum* of the Romans—we took up our old familiar quarters, under the hospitable sign of the Bush. A morning was well spent in viewing the castle and cathedral. The keep of the former is a good specimen of a Norman stronghold, the surrounding walls include a space of a mile in compass. In one of the cells of the keep, the wall bears testimony to the calamity of many a high-spirited gentleman who, in the '15 and the '45, found here a brief sojourn before ascending the scaffold, in coats of arms, devices, and other inscriptions. From the keep a fine and extensive prospect commands the fertile course of the Eden, and the Solway Firth, with a wide stretch of Scottish land, Criffel and the chain of Scotch hills extending to the west as far as the eye can reach. To the east the cultivated lands subside into barren wastes that reach the feet of the rugged Northumbrian crags. Southward, the plains of Cumberland stretch to Penrith, where they are bounded by Crossfel and Skiddaw. The cathedral, commenced in the time of William Rufus, contains, besides the heavy but impressive features of the Norman style, a series ending in the decorated style, of which the east window is a very fine and perhaps unmatched example. We now turned our backs on "merry Carlisle," and proceeded to the village of Kirk Andrews, where the vallum again makes its appearance, and a heap of stones in the churchyard are conceived to be the remains of a mile castle. In a garden of the village an altar, found at Kirksteads, a mile south of the wall, is preserved. The inscription it bears is as follows:—

L(VCIVS) IVNIVS VIC-
TORINVS ET(?)
C(AIVS) AELIANVS LEG(ATI)
AVG(VSTALES) LEG(IONIS) VI VIC(TRICIS)
P(IÆ) F(IDELIS) OB RES TRANS
VALLVM PRO-
SPERE GESTAS.

From the village the wall follows the river by a north-west course, through a field called Long Wall, the vallum running in a line with the road. A quantity of stones in Beaumont churchyard, which the wall reaches, seems to mark the site of some building which stood here apart from the wall itself; and it is surmised of greater magnitude than a mile castle. A little west of Monk Hill, the vallum crosses the turnpike road, travelling on the north side of it to Burgh on the Sands, where there are traces of another station, within which are the church and the churchyard, the latter having yielded to the sexton's spade numerous fragments of urns, lachrymatories, and a few inscribed stones, but none of them affording any reference to the cohort by which the station was garrisoned. The church is built so as to adapt it to the purpose of refuge and defence in border strife. The walls of the tower are seven feet thick, the only entrance being from the interior of the church, and that is secured by a massive iron door. The basement of the tower contains a vaulted chamber, lighted by three narrow slits in the wall. A spiral stair of stone leads to two upper chambers. In case of need the cattle might be driven into the basement or the body of the church itself, and the upper chambers have afforded a strong refuge to the fugitive inhabitants of the place. Many Roman stones appear in the masonry of the church. Near to Burgh is the site of the castle of Sir Hugh de Morville, one of the murderers of Thomas of Canterbury. The field adjoining bears the significant cognomen of "Hangman Tree," and a neighbouring inclosure is distinguished by the no less suggestive name of "Spill Blood Holm."

It was at Burgh on the Sands that Edward the First—"the hammer of the Scottish nation,"—was checked in his northern campaign, with only the Solway between him and the objects of his

long and deadly hatred, and in the words of Lord Hailes, "in sight of the country which he had devoted to destruction." His last orders, Froissart tells us, were that the flesh should be boiled from his bones, and that these, encased in leather, were to be borne in the career of vengeance which engaged his last meditations, and which he bound his son and successor, by oath, to prosecute.* A monument, of modern date, marks the spot where the "ruthless king" yielded up his stern and resolute spirit. Between Burgh and Dykesfield, the works are perceived only by the faintest traces of the wall—not one stone remains upon another above ground. The ploughman only in driving his furrow succeeds in revealing the buried mystery; but even in instances where the wall has been fairly uprooted, Dr. Bruce, like a keen hunter, takes the lead and guides us onward by what he pithily names the "Trail of the Wall," and which consists of small fragments of stone by which the ground is thickly strewn.

On the way between Burgh and Dykesfield, an eminence called Watch Hill, was found when the contiguous land was drained, to be so full of stones that it was not considered necessary to carry the trenches over it. These stones are most likely the remains of a watch tower which gave name to the site. At Dykesfield, probably so named from the works, a small altar was found, and where the wall descends towards Burgh Marsh, quantities of stone, together with ashes and coal appear, and from these indications, together with some difference between this tract and the surrounding soil, it is surmised that here had been a small station. From Dykesfield even the "trail" is lost. Here the vallum ends, and for the further course of the wall, the ploughman is our only guide. By his testimony it would appear that the wall has been carried by the southern margin of the marsh, which fills up the space between Dykesfield and the Solway, making a wide sweep to Drumburgh, where tokens of a small camp are evident; and this, if Watch Cross be thrown out, would make the sixteenth station upon the line of the wall, and thus correspond with the *Axolodunum* of the Notitia, which was garrisoned by the first cohort of the Spaniards. The ramparts and ditch of this station are both well defined. To the south of the ramparts is a circular well, lined with Roman masonry, which is still in use. Near to the station a fine example of the fortified manor house is found to be built of Roman stones. It has undergone extensive modifications about the time of Henry the Eighth. Between Port Carlisle and Bowness, some considerable portions of the wall were remaining in Brand's time. One portion he found to be about eight feet high. Hodgson, speaking of a fragment visible quite recently, says:

"It is six feet high, its rugged and weathered core, still hard as a rock, is thickly bearded with sloe thorn and hazel, and mantled below with ivy and honeysuckle."

But though thus adorned by nature, and interesting as a final vestige of the mighty wall, neither the interest belonging to it, nor its intrinsic strength have availed to rescue it from the hand of wilful and uncalled-for destruction.

Bowness may be the site of the *Tunnocelum*, or the *Gabrosentum* of the Notitia, according as Watch Cross or Drumburgh be taken for the sixteenth station on the line of wall. Only very slight traces of the ramparts of the station can with difficulty be discerned near the church. The neighbourhood does not produce stone, and the wall and station, as in other instances, have furnished material for the construction of the church and the greater part of the town.

Here we took our leave of the wall, as I do of the reader, if indeed I have found one to accompany me throughout this itinerary. But in the trust that I may have so far succeeded, I venture to advise him, instead of wasting a summer month at Ramsgate or Brighthelmstone, to take a berth in one of the General Steam Navigation Company's fine vessels for the Tyne; let him put this slight record of a wall-pilgrimage in his pocket, to serve as a portable guide from station to station, and see for himself much that, writing within a limited space, I could but touch upon. In so doing, I venture to promise him, if he be a good pedestrian, a walk of unusual interest, enhanced by the observation of fine and varied scenery; and I undertake to say he will find matter for amusement, and even instruction, in the manners and dialect of the people with whom he will make acquaintance as he jogs on his way, or when he takes his rest, Good fare, I promise him. When wending through the wild and unfrequented parts of his journey, he will not fail to find matter for reflection, while he bethinks him of the powerful material genius of the people by whom these regions were once thickly populated, and he will be ready to say, with Scott, in the words which he puts into the mouth of his hero in "Guy Mannering," "What a people! whose labours, even at this extremity of their empire, comprehended such space, and were executed upon a scale of such grandeur. In future ages, when the science of war shall have changed, how few traces will exist of the labours of Vauban or Coehorn, while this wonderful people's remains will even then continue to interest and astonish posterity! Their fortifications, their aqueducts, their theatres, their fountains, all their public works, bear the grave, solid, and majestic character of their language, while our modern labours, like our modern tongues, seem but constructed out of their fragments."

J. W. Archer.

* This vindictive order was not complied with, for, in 1774, the tomb of Edward I was opened, and the body discovered in all the pomp of buried majesty.

RAMPARTED WARSHIPS AND SMOOTH BORE GUNS.

The "Times" tells us of the great success of Mr. Jones's angulated target. This system of ship defence was propounded in Once a Week before Mr. Jones laid it before the Admiralty, and was in the hands of the Editor before the date of Mr. Jones's patent. Well, there is now verified by actual experiment what most people must have known before—that a shot will glance from an inclined surface, where it would pierce through a vertical surface, or if it does not glance, there will

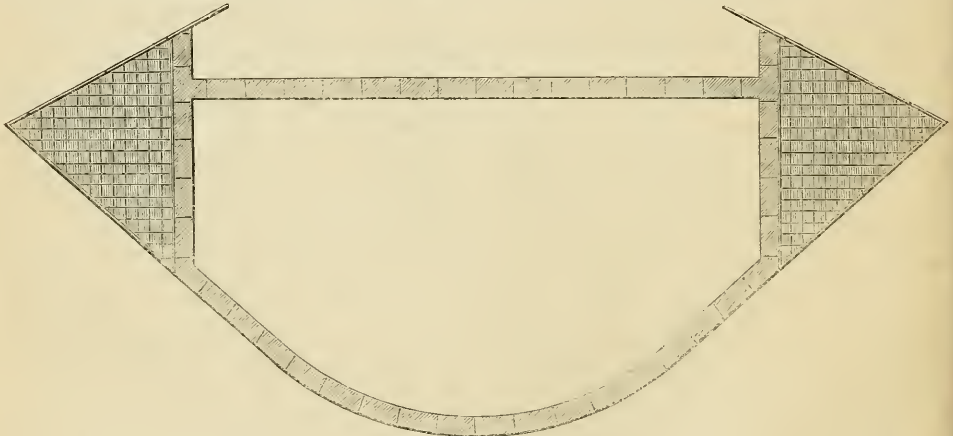
be better resistance. And now the question is, how best to apply armour defences to ships' sides. Firstly, we have the plate, and secondly, the inclined position—but it must be attached to something firm and solid, that will absorb the concussion, and, if the shot passes through the plate, will prevent it from reaching the vessel's side.

The best plan is to make the armour and its support a separate structure from the vessel, *i. e.*, a solid-built rampart surrounding the sides of the vessel, and attached thereto, with floating power, to help to carry the armour.

Supposing the sides of the vessel to be vertical, a mass of solid fir balks should be trenailed together in a triangular section, one side to be covered with plate-iron, and attached to the vessel's side. The two other sides, the upper one forming an angle with the horizon, and the lower side immersed in the water, should be covered with armour plates, the apex at about the water's edge being formed of armour plate rolled to an angle. The upper portion of the armour plate to be carried partially over the deck, forming a kind of penthouse. Through these plates the guns are to pass in a closed port, formed by a ball muzzle to the gun, working in a socket. The ramparts will thus have eight feet of timber behind the armour plates at the level of the deck, and it would be scarcely possible to damage the hull of the vessel by any amount of existing shot, while their bearing on the water will steady the vessel under a heavy armament. The ramparts are to be built in sections, so that any part can be removed in case of damage, and replaced.

The hull of the vessel should be formed of two skins of plates, two to three feet apart, connected by stay bolts three to four feet apart, and filled in with solid elastic bitumen, Seyssel Asphalte, or similar material. The diagram shows a midship section of the principle of structure.

The objection to be raised here is, that the immersed section is considerably increased. True, but we have a really shot-proof vessel capable of carrying a heavy battery on her deck, of great



Hull—two skins of iron stayed together and filled with bitumen. Ramparts of iron plates lined with solid timber attached to the vertical sides of the hull.

strength of build, and not liable to strain rivets, or to leak. To make her perfect, the plates should all be solidly welded together, and not riveted; and to make up for increased resistance by greater immersed section, is simply a question of increased length and increased power, which the increased strength will bear. No stern propeller would shake this hull to pieces.

After all that has been said of the damaging power of the Armstrong and Whitworth guns against armour plates, it has been stated that the most mischievous weapon is the service 64-pounder of 8-inch smooth bore. There are obvious reasons for this result, and one chief reason probably is, the friction of the rifles which diminish the velocity of the shot.

Sir Charles Napier, of Scinde, was accustomed to say that the smooth bores had not been given a fair chance. There is little doubt of this, and the time will come when the children of a future generation will ask why soldiers were called riflemen, and the answer will be, because the guns were contrived with one defect to compensate for another.

We have not yet seen the ultimatum of great guns, and shall be glad of Sir William Armstrong's next instalment as a contribution towards what will be. In heavy guns, with the gunners thoroughly protected, and in the highest speed, will be found inevitable victory—always supposing the crew and gunners to be of our own webfooted race.

W. Bridges Adams.

PASQUIN AND MARFORIO.

Pasquin and Marforio are probably not so old, by some hundreds of years, as Mr. Punch, who began life as a popular actor in very early Roman times, but their first literary efforts preceded his by nearly five centuries. They continue to exercise their moral and political censorship in Rome to this day; their names are as universally known as those of their illustrious brother of London; but whilst his works are in everybody's hands, theirs have, for the most part, succumbed to the arts of suppression practised by the Papal government, and little of them has been left to the world except

their fame. The authoı of the "Curiosities of Literature," who has devoted two or three pages to their history, has quoted only seven of Pasquin's epigrams, six of which are taken from a very rare work, published at Basle, so long ago as the year 1544, with this title—"Pasquillorum Tomi Duo." No later collection having been attempted until the present year, great was the eagerness with which we sat down to devour M. Lafon's book ;* but that was quickly done, for the choicest part of M. Lafon's book consists only of a score or two of epigrams, some of which we shall translate, with one or two pasquinades taken from other sources ; after a few words of our own about their reputed authors.

Their history, after much sifting, has come at last to be substantially as follows :

There lived in Rome, in the fourteenth century, one Pasquin, a tailor, who had much custom and kept many journeymen. Both master and men allowed themselves great freedom of speech in censuring their superiors, of every degree, up to the cardinals and the pope himself. The disdain with which the members of the Papal court looked down on men of their condition secured to these railers an impunity of which persons of higher mark began, ere long, to take advantage. Whatever strokes of satire could not be avowed by the real authors, except at the cost of their lives, were fathered upon Pasquin and his saucy varlets, and, as common fame is never critical in such cases, the people gave their ready aid to a subterfuge which fell in with their humour. Hence it became an established custom to attribute to Maestro Pasquino all the wicked wit that was discharged anonymously upon the dignitaries of church and state.

After the tailor's death his name and functions were imposed by popular acclaim on an ancient statue, which had been recently exhumed, and erected at the angle of the Orsini Palace, where it still remains. It is much mutilated, but is the ruin of a very fine work, and was greatly admired by Bernini. Count Maffei believed that it represents Ajax defending Menelaus. The statue of Marforio, in the courtyard of the Capitolian Museum, represents a recumbent river-god, and its name is a corruption of that of the place where it was found —*Martis Forum*. Marforio is the friend and confidant of Pasquin, and generally plays second fiddle to him in their joint performances, the one starting topics and the other despatching them ; but occasionally these rôles are reversed. It was not through any sudden freak of the people that the heritage of the sharp-tongued tailor devolved on his marble representative. The thing came to pass in the most natural way in the world. The statue having been set up in one of the most frequented thoroughfares of Rome, the municipal authorities began to use its pedestal for posting up their notices and by-laws ; the clergy and the court, following this example, placarded it with their banns, their bulls, and indulgences ; and this suggested to the malcontents the idea of making it "a vehicle for the keenest satire in a land of the most uncontrolled despotism." The intense bitterness of feeling which has rankled for five centuries in the hearts of the Romans may be measured not only by the virulence, but by the daring pertinacity with which they caused the stones of their city to cry out against their tyrants. There remained no hope of mercy for the man who was detected, by night, in the act of furtively affixing a paper to the marble, and yet the peril was incessantly braved. In the reign of the Borgias, a Venetian, who had translated a Greek epigram on the Pope and his son, was strangled, and every one who was suspected of a similar crime was thrown into the Tiber with a stone about his neck. Under Pius V., who was canonised, offenders of this kind were hanged, and their bodies were burned by the Inquisition. This was the fate, among others, of Aonius Palearius, the Latin poet, who indeed had added to his literary crimes the still deeper guilt of rejecting the cross, that is to say, the letter T, from his Christian name AnTonius.

In the pontificate of Sixtus V., who had begun life as a barefooted herdboy, Pasquin was seen wearing a dirty shirt, and the following dialogue took place between Marforio and him :

Marforio. "How slovenly you are grown, Pasquin ; what a dirty shirt you have on ! You are as black as a collier."

Pasquin. "That is because my washerwoman has been made a duchess."

The washerwoman was the Pope's sister. Apropos of this pasquinade, Brantôme relates "an admirable action" of his Holiness. The Pope was so enraged that he issued a proclamation offering a reward of ten thousand crowns for the name of the man who had insulted himself and his sister, and promising, besides, that if the offender would reveal himself, his life should be spared, and the reward should be paid to him. The unfortunate wit fell into the trap, presented himself to Sixtus, and received the ten thousand crowns on the spot.

"I have made thee a promise," said his Holiness, "and I will keep it ; not for my life would I break faith with thee ; but there is another thing I have not promised thee, and which I will yet fulfil—that is, that the hand which has written so ill shall be cut off, that thou mayest remember never again to write such scandalous words."

"Many great personages," observes Brantôme, "would not have so strictly kept their word in so scandalous and injurious a matter ; and for that he did so, it behoves us to praise this great Pope."

All other means of suppression having proved unavailing, Clement VIII. thought to silence the pasquinaders by destroying their mouth-piece, and Pasquin was condemned by a commission, composed of Cardinals, to be broken in pieces and thrown into the Tiber. Fortunately, however, before the sentence was executed, Clement's nephews consulted Tasso, who dissuaded them from having recourse to so puerile an expedient. "If you throw Pasquin into the river," said the poet, "he will turn all its mud into swarms of frogs that will never cease croaking night and day."

The first epigram in M. Lafon's collection is addressed to Paul II., and plays upon the double meaning of the word *beatus*—saintly—blest in a worldly sense.

* Pasquin et Marforio, Histoire Satirique des Papes, traduite et publiée pour la première fois par Mary Lafon. Paris, Dentu, 1861.

Quum sit filia, Paule, sit tibi aurum
Quantum Pontifices habere raros
Vidit Roma prius, pater vocari
Sanctus non potes, ac potes beatus.

"Thou hast a daughter, and golden store
Greater than Pontiff e'er had before.
Scarce art thou holy therefore ; rather,
Paul, let us title thee blessed Father."

Papal simony is branded in the persons of Alexander VI., Julius II. and many more :

Vendit Alexander claves, altaria, Christum ;
Emerat ille prius, vendere jure potest.

Keys, altars, Christ are sold by Borgia ; well,
What he has bought he has a right to sell.

Fraude capit totum mercator Julius orbem ;
Vendit enim cœlos, non habet iste tamen.

World-cheating chapman Julius gets his price
For what he has no right to, Paradise.

Pasquin was a great writer of epitaphs ; he never let a Pope be laid in his tomb without speaking out his mind about the departed. Whose fault was it that he had not a good word to bestow on any one of them ? This is the tribute he pays to the memory of Clement VII. :—

Nutrix Roma fuit, genetrix Florentia : flevit
Nec tua te nutrix, nec tua te genetrix.
Mors tua lætitiam tulit omnibus, unica mœret
Quæ te regnavit principe, dira fames.

Florence, thy mother, Rome, thy nurse, have shed
No tear for thee. Clement, that thou art dead
Gives joy to all. One mourner hast thou solely—
Famine, the partner of thy reign unholy.

Dr. Curti, Clement's physician, is extolled in an epigram for having physicked a bad pope to death, and cured the state. Again, among a long string of Scriptural texts applied more pointedly than reverently to sundry public characters, this one is allotted to Curti for having rid the earth of an incarnation of all wickedness, "Behold the lamb of God that taketh away the sins of the world !" The epitaph on Clement VII. is mildness itself in comparison with that on Paul IV. (Carafa) :—

Hic Carapha jacet superis invisus et imis :
Styx animam, tellus putre cadaver habet.
Invidit pacem terris, et vota precesque,
Impius et clerum perdidit et populum.
Hostibus infensis supplex, infidus amicis.
Scire cupis paucis cætera ? Papa fuit.

Carafa's soul, of God and man the foe,
Is with the damned ; his carcase rots below.
Clergy and lay undone, could he have barred
Our secret prayers, his joy had been unmarred.
Judas and craven without heart or hope,
To sum all in one word, he was a Pope.

Paul IV. revived the dormant powers of the Inquisition, and made it so violent that when he died in 1599, the people broke into the prisons of the Holy Office, and rescued four hundred victims, sacked the palace of the inquisitors, burned their books and papers, pulled down the statue of the deceased Pope, and dragged the head about the streets. It was with the greatest difficulty that the corpse itself was saved from their fury. Such was the execration in which Carafa's memory was held amongst them, that for a long time they would not suffer the street hawkers to cry *bicchieri e caraffe* (glasses and carafes).

The three following epigrams are addressed to Paul III. (Farnese).

Nescio si verum est jam te faciente per urbem
Quod sal vendatur carius omnis ait.
O bene consultum, nil hoc perfectius uno :
Jam fœtes, æquum est sit tibi cura salis.

All curse the grievous price of salt,
And murmur, Paul, it is thy fault.
I blame thee not of salt for thinking,
All rotten as thou art and stinking.

Ut canerent data multa olim sunt vatibus æra :
Ut taceam quantum tu mihi, Paule, dabis ?

Poets, 'tis known, in days of old,
To make them sing, were given gold ;
But how much will you give *me*, Paul,
To stop my singing once for all ?

Pasquin would accept a cardinal's hat as the price of his silence—

Tandem, maxime Pontifex, galerum
Pasquillo tribuas tuo roganti.
Si sensu sine sum, rude atque marmor,
Complures quoque episcopos videmus
Ipso me mage saxeos creari.

Grant, Holy Father, to thy Pasquin,
The hat for which he has long been asking.
I'm but a block of stone ; what matter !
'Twill make no difference to the hatter.
Far duller blocks, all must acknowledge,
Are plenteous in the Sacred College.

The argument with which Pasquin supports his pretensions on this occasion appears to have had its grain of truth. Cornelio Masso, a cordelier, went to the court of Paul III. to solicit the cardinal's hat. The Pope told him one day he had been given to understand that he, Masso, was a bastard. The latter, nothing daunted, replied, "Your Holiness has made cardinals of so many asses that you may well make one mule a cardinal."

The following pasquinade appeared during the occupation of Rome by the French in 1810 :—

Marforio.—Is it true, Pasquin, that all the French are robbers ?

Pasquin.—Not all of them, but a good part—(*Buona parte*).

Early in the present pontificate, when the Pope returned to Rome after an excursion to Bologna and Loretto, Pasquin's statue displayed these three lines :—

Pio nono
Justo e buono
Mastaï.

Mastaï was the Pope's name before his election. He was Count Cardinal Mastaï-Feretti. Hence the pun which gave point to the inscription, its sense being—"Pius IX., you are just and good, but you halt on the way *(ma stai).*"

On a subsequent occasion of the same kind Pasquin exhibited a placard containing only these three figures : 610. Six hundred and ten, or in Italian, *sei cento dieci*, what could that mean ? Everybody hastened to Marforio for the solution of the enigma, and found it in the words *Sei un zero*, "Thou art a cypher." Name the figures separately and you have 6=*sei*, 1=*un*, 0=*zero*. Now *sei* is a word of double meaning ; it may stand either for "six" or "thou art," and thus 610 may signify "Thou art a cypher." How superior after all, to the sly hits of Transalpine jokers, are the witticisms which move us in these northern latitudes !

Walter K. Kelly.

LILIAN'S PERPLEXITIES.

A TALE IN TWELVE CHAPTERS.

CHAPTER V. PROPPED UP.

It is a serious matter when the water-bottle does not dilute the feverish consequences of the night's excitement, and soda water absolveth not on the morrow. Westby lay that night in a horsehair shirt of remorse, and made great and audible confession in his small attic the next morning.

"I'm an ass and a knave!" this was the burden of the confession, amid the splish-splash of the cold water, and the work of razor and brushes.

Westby felt a grim satisfaction in emphasising this declaration, in laying it down as a strong proposition that needed no argument for its support.

"What the deuce is the matter with me? I know I can't support a wife. I should be the veriest fool in the world to entangle myself in a hopeless engagement—and then, that I should be on the point of taking a wretched advantage of Newton's misfortune! Good God; if that girl had not been ten thousand times better and truer than I was! Curse it! what an infernal cut! sticking-plaister! and I was so deuced grand in my notions of honour and all that—pshaw! it won't stick. Mighty useful thing, this conscience of mine! I'm a wretched, beggarly fellow!"

Ay, there was comfort even in heaping up all sorts of contemptuous expressions, in degrading himself in the contemplation of high principle, in thorough self-bullying. At last, being very humble and contrite, he began to find consolation in forming resolutions for work and labour on behalf of Newton and his affairs.

And Lilian Temple—this was her confession, contained in a letter to her brother:

"I know, Fred, it was very naughty of me not to write to you all this time—only adding a line to mamma's letter to tell you of my engagement.

I assure you it was not laziness; the real truth is, I was not quite happy in my mind about accepting Mr. Newton, and I felt a little afraid of writing to you. You know I told you all about Charles Westby: I shall tell you everything now. You recollect I agreed with what you said as to the folly of letting that matter rest in my mind. Well, I did manage to dismiss my foolish fancy of love, but I never could get over a sense of pique at the low appreciation he manifested for my character,—that I was without power or strength to endure the serious labour of the world. Somehow, I kept dwelling on that, very foolishly, no doubt, and at last I grew to think, with his age and experience, he might have read my character aright: I had never been tried,—I might, after all, have been deceiving myself with vain ideas of excellence.

"I cannot plead that I acted without full knowledge with regard to Mr. Newton. I saw clearly from the first what his character was—no pretension to a highly cultivated intellect, no great strength of purpose, but a good heart. He made me an offer very shortly after his introduction to us: I talked the matter over with papa and mamma; they decidedly liked him, and urged very strongly his wealth and good position. I did accept him! I know you will blame me; I'm ready enough to blame myself; but the offer was made very suddenly, and I did honestly believe I could really love him as time went on. I am sure no lover could ever be more devoted in his attentions; he invariably deferred his opinion to mine; day by day I grew more convinced of the absolute power I possessed over him. I might well be flattered,—I was flattered and proud, when my spirits were at the full, but in certain times of depression and doubt, when I wanted support, why I found he was leaning on me. You recollect, Fred, that day at Brighton, when the horses were so fresh, and I would insist on taking the reins out of your hands at the straight piece of road. I felt so proud of driving, they went so splendidly, but when something startled them in the hedge, and for all my hard pulling they kept getting ahead, and you, to punish me, would not take back the reins, why I felt a little frightened then, though I knew well enough you were at my side and would seize the reins at any moment of real danger; but with Mr. Newton, I foresaw whatever course the events of life might take, the responsibility and direction of everything would rest with me. I was downcast and dismayed when I thought upon this.

"Then came that sad bank failure. He told me he was ruined, poor fellow! Ah, Fred! for some three hours in my room I had a hard fight of it. It was such a terrible shock. In opulence I had felt we might live very happily, but in a life of struggle—how? I told you when we used to talk about Charles Westby, that I believed I could work, strive upwards, dare and do anything, following in the footsteps of a man I admired and looked up to, but to take the lead oneself, to have to encourage, to animate another.—There! I dare say Karlo Magno was right after all. I do not in any way possess this power of endurance. I know I prayed earnestly for strength; I thought of what you would say, but it was all of no avail; the more I thought upon it, the more terrible the pledge I was called upon to make. Thank God! Karlo Magno was near me at this great time; he spoke to me as I know you would have spoken, and then I went to George Newton, and promised to hold by him in adversity."

* * * * *

CHAPTER VI. ON A PEDESTAL AGAIN.

Charles Westby had worked hard in George Newton's affairs, and he had worked to such good purpose that that gentleman was enabled to return to England with safety after about four months' absence. The arrangements to effect this had not been made without heavy pecuniary sacrifice, but owing, by good luck, to a railway which was proposed to pass through a large portion of Newton's property, there was every reason to believe that the purchase-money of the land would very nearly make up the loss on the bank transaction.

It was probable that if Newton had been content to remain abroad for a longer term a better bargain might have been made with the creditors, but Newton begged and prayed of Westby to forward matters, at any cost, so as to allow him to return to England. Concessions had therefore been made which, in a business point of view, were unduly adverse to Newton. Westby's view of the affair was this: "Newton may, perhaps, lose some additional thousands, but he will the more surely secure the girl he loves." Westby, too, was strongly actuated by his own feelings; he felt he could never entirely forgive himself until he saw Lilian married to Newton. The fierce temptation of that night's interview had left its smouldering remorse at Westby's heart. Perhaps this feeling unduly blinded him to other considerations; for instance, Lilian had confessed to him the nature and quality of her love for Newton. Was it altogether satisfactory that she should marry under such circumstances? But, in answer to this, he could never break from his mind the recollection of Lilian as a child; and, as far as he could judge, the old impulsiveness of her nature was unchanged—at one moment attracted by the novelty of his own grim countenance, at another dazzled by the advantages of Newton's offer. And then he knew that Newton was such a good fellow, possessing such an excellent heart, that any woman might be fortunate in his love. Beyond all this, Lilian had pledged herself to Newton, and when he thought of this pledge he forgot all else but his own remorse at the idea that he should have been on the point of inducing her to break that pledge; and just with the same feeling with which he despised himself, did he contemplate the idea of Lilian breaking her engagement.

It was the greatest satisfaction to Westby, when, after a hard day's work at final arrangements, he was enabled to send a telegram to Newton, at Boulogne, stating that he might safely return to England; for, beyond his feeling of gratification at bringing the lovers together again, he felt relieved at the idea of Newton's affairs being wound up, his assiduity on their behalf having seriously interfered with his professional labours.

"Well, come," thought Westby, as he paid the clerk at the telegraph office, "there is an end to Newton, for this night at least. If I am only left at peace I shall be able to see the end of that brief by sticking to it hard all night."

But, alas! when Westby entered his chambers, there, before his incredulous eyes, stood Newton.

"If you are merely a spirit, I don't mind," exclaimed Westby, annoyed; "but in the flesh you have no business here."

"Your last letter—" muttered Newton, apologetically.

"Positively stated that you were not to return till sent for," rejoined Westby. "Nevertheless," and his voice somewhat softened, "you are partly absolved by circumstances, inasmuch as a message advising your return is now seeking for you at Boulogne."

"How can I ever repay all your kindness?" exclaimed Newton, clasping Westby's hands.

"Don't interrupt the judge," cried Westby, with affected solemnity. "Recollect you only stand entirely absolved on one condition, that you condense everything you have to say into five minutes. Here, look at that," and Westby pointed to a bundle of papers. "I've got to stuff every bit of it into my head before I go to bed."

"I know you have been working so hard for me; you're the best, the dearest fellow that ever lived."

"Let me warn you, Newton, not to waste your five minutes with adjectives. Come, now, how did you get on in France? Anything to match your pet Southdowns there?"

"Hang the sheep, Westby! I know you always hate to be thanked, but I will say what I feel."

So Westby was forced to listen to the outpourings of Newton's gratitude.

"It's a kindness to send you away, old boy," said Westby, when the five minutes had expired. "I know where you are off to."

"I shan't be expected, shall I?"

"Well, to say truth, you won't—for a letter which I posted this afternoon to the young lady mentions to-morrow as the earliest period for your appearance—it will be all the greater surprise."

Newton having departed, Westby buried himself in his large chair with the documents before him and his favourite pipe in his mouth. With all his efforts he felt a tendency to wander away from the subject on hand; Newton would come struggling into his mind, and Lilian, and the meeting of the lovers; but gradually as he warmed to his work, as he mastered the facts of the case, and drew his inferences, weaving them into possible arguments, his mind became perfectly absorbed. Though the generality of readers may wonder at it, I affirm that Westby experienced intense satisfaction in this severe mental application; the intricacies of the case began to clear away; bit by bit his own arguments grew side by side with the anticipated arguments of his adversary. Ah me, the joy of antagonism, and its power to evoke the energies! In all probability, two or three other men were at the very same time in adjacent chambers at work on the same subject; men of talent equally absorbed — absorbed just as poets are absorbed in the effort of creation—tasting, too, as poets taste, the joy of creative power in new points to be raised in argument.

Thus time sped on unheeded by Westby.

There was a tap at his door; he mechanically cried "Come in!" but being so preoccupied, he was scarcely conscious that anybody had entered until he felt a hand on his shoulder; he roused himself, and looking round saw Newton pale and agitated.

"You must forgive me for troubling you at this time of night, but I saw a light in your room—that old housekeeper of yours who never seems to go to bed let me in. I could not rest, Westby, till I had told you about it. The engagement's off."

"Broken off?—impossible!"

"Broken utterly."

"By whom?" asked Westby.

"Mutually; but I must tell you that we are both pledged to silence regarding the reasons."

Westby was lost in astonishment.

"I did not come to make a confidant of you in this unfortunate affair," continued Newton. "I came, old boy, to grasp you by the hand, and tell you again—for I did not say it half enough when I saw you first—how truly sensible I am of all your efforts on my behalf. You have stuck to me, Westby, and I feel that more than I can say after what has taken place. You will forgive me for bothering you."

Westby shook Newton's hand, and he felt how it trembled.

"You have had a personal interview with Miss Temple?"

"Yes. I will tell you as much as I may of the circumstances. When I left here I drove straight to their house. I found to my surprise that they had a party. I was a good deal put out by this, wishing to see Lilian quietly, and I was of course anxious to make as little talk as possible about my return to England. I was dying to see her, but somehow I had not pluck to enter the house. I stood some time behind the crowd who were looking at the people getting out of the carriages. You know I'm very stupid about these things—my travelling dress, too, and how to explain to the men at the door who I was, for, as plague would have it, the servants seemed to have been all changed. Well, I screwed up my courage at last, and knocked at the door. There, I forgive those infernal fellows now, how the deuce should they have understood my story? but at the time I would have given anything for leave to send one of them to ground. At last I got hold of Lilian's maid, and then I learnt the rights of the affair. They had got private theatricals. Miss Temple was to play the chief part, the girl told me; she had just finished dressing her mistress and the play had already begun; should she go and say I had arrived? I told her not to utter a word of my being in the house till the play was over, and in the mean time to put me in a room where I could remain undisturbed by the guests. After some difficulty, I found refuge in Mr. Temple's dressing-room and special sanctum. One of the bills of the performance lay on the table.

I could hear the laughter and applause from the drawing-room. I listened till I could stand it no longer,—all looking at Lilian, and I, who fancied I had the best right to see her, absent. I stole down-stairs, and got into the drawing-room behind the company, hiding myself among the servants, but I could see the stage perfectly.

"By Jove, Westby, how she did act! There, it was not acting—she felt it all; I hated to see her, and yet she did look so out and out lovely. It was some French story, as far as I could make out: she was engaged to a man she did not like, and yet to suit her purpose she could smile, and laugh, and cajole. I kept saying to myself, 'It is acting, it's only acting,' and I heard the people talking in front, 'It's nature, perfect nature, not acting.' And they were right, Westby!

"I was sickened by all the laughter and applause; there was laughter and giggle, too, where I was, though in an undertone, particularly towards the end of the play. I could not but listen.

"'The fun is,' said a servant girl before me—of course they were in utter ignorance of my presence—'the fun is, she is really in love with the very man she don't like in the play. I'm sure of it.'

"'Well, he is always here, for one thing,' said another.

"I can tell you, Westby, a child might have knocked me down."

"There, there," cried Westby with disgust. "I want to hear no more of it. I can see it all. I can tell you the fellow's name—Frank Scott! I had heard some rumours, but like an ass I disbelieved them. Pshaw! I know the whole story as well as if you had given it me word for word—it's the story of a heartless flirt."

"No, no! Westby," cried Newton, vehemently. "I never meant to tell you about Scott, it will only mislead you. She is not in love with him!"

"I don't understand you, Newton."

"I can only tell you I believed it as strongly as you do now—I taxed her with it—"

"And of course she denied it," interrupted Westby. "Credat Judæus! Forgive me if I'm rather sceptical, it was not to be expected that she should confess to you the name of her new lover."

"Look you here, Westby, I only regret that it is not in my power to tell you all the facts about our last interview—she is not in love with Scott, I'm certain of that—but enough of the whole affair. It is so very painful to me that I dare not dwell on it, and just because it is so painful, and just because I feel so utterly desolate, I've come to shake your old fist and have a bit of comfort in seeing a friend who has been staunch and true throughout."

"Thank God," murmured Westby, "I can give you my hand on it." Then in a louder tone, "These misfortunes cure themselves, Newton. You are well rid of her—bear that in mind! But Fred Temple," and Westby's voice dropped, "what would he say to this? his sister a wretched jilt! You never knew Temple, Newton. I can tell you this affair would have wounded him to the quick. I know he would never have forgiven her. Good God! to think Lilian should have acted thus." Westby was silent for a while, then he suddenly drew his hand from Newton's grasp. "How dare I throw stones? Newton, I'll hide nothing from you—I'm a beggarly humbug. I was once madly in love with this girl—madly, madly, I can tell you. I could speak and think rightly enough till I was tried in the fire, but then I was as weak—as weak as the meanest wretch living. I talk of despising her indeed! That night, Newton, before she came to bid you adieu—and, mark you, she asked me as her brother's friend for my advice—there, it was rising in my soul to take advantage of your misfortune, and so win her from you; but she knew what her duty was then, if she has forgotten it now, and she told me what it was, putting the very words into my mouth, while I was struggling with my wretched thought, and so she saved me from being in very fact a scoundrel and a knave. You may cut me to-morrow, Newton, but I'm glad I've told you. I could not hold it back after what has taken place."

There was a painful silence.

Westby's words of self-accusation had burst from his lips with vehement fluency, but when he began to speak again it was with the utmost hesitation and uncertainty.

"You are my very oldest friend, Newton, and I would not for worlds have you despise me. I have accused myself, therefore I have a right to say something in my own extenuation. That wretched night cured my wicked stupid love. I swear to you, Newton, that I have done all that lay in my power to serve your interests, both with the Temples and with regard to that bank business. Do tell me you believe this."

"I do believe it, you dear old boy, from the bottom of my heart!" and Newton took Westby's hand in his.

"I wish that there was a pledge of assurance deeper than words," exclaimed Westby.

"Why, your labour in that bank affair speaks for itself," urged Newton, "and I may tell you thus much of our interview—Lilian Temple swore to me that your influence had held her for so long true to me."

Newton emphasised all this with a hearty shake of the hand.

"Good night, old fellow," said he, taking up his hat. "I shall come and breakfast with you, mind that—eight o'clock, hey?"

"I can say later, if you like."

"No, no; at eight o'clock I'm your man," and Newton left the room.

Westby understood the motive of Newton's proposal to come to breakfast. "He really does forgive me! Pshaw! I shouldn't wonder, after all, if this is not some foolish lovers' misunderstanding, which a few judicious words may set straight. I'll see Lilian to-morrow; she taught me aright once—I'll try if I can't teach her aright in return."

CHAPTER VII. REAL ACTING.

But we must now give the other side of Newton's story:—

"Rouge!" exclaimed Lilian, "please—no."

"Before the lights, miss, you'll be as white as a ghost," expostulated Mr. Williams, the eminent perruquier.

"As little as possible, then."

"Madam!" exclaimed Mr. Williams, in a deprecatory tone, for even the fairest could not be allowed to dictate to him. Was he not an artist, working on nature's grandest handiwork, adapting it to the necessities of art? I defy you to be five minutes in the company of Mr. Williams without discovering that he was an artist, because he always took care you should learn the fact by word of mouth. So Lilian seated herself in a chair before the dressing-table, which was covered with the materials of Mr. Williams' art, and surrendered herself unconditionally into his hands. And very hot, puffy, steamy hands were the hands of Mr. Williams.

"I flatter myself, miss, I know your part as well as you do."

"Better, perhaps," replied Lilian, smiling. "Oh, where's my book? I'm never comfortable without it. Run, Jane, and see if I left it on my dressing-table."

"I don't mean, miss, word for word, but I mean the exigencies of the part," explained Mr. Williams. "If I can't conceive them somehow, I can't paint nohow. I lay in the groundwork of the passions with my colours, and then the features have only got to develope 'em at the right moment. Features, miss!" exclaimed Mr. Williams, warming with his subject, "why I've painted peoples' faces right out, so that their own fathers didn't know 'em."

"You will be more merciful to me, won't you, Mr. Williams?"

"Heaven forbid it in your case, madam," exclaimed Mr. Williams, gallantly. "I'm merely raising the natural tone of colour up to the strength of the lights, with the slightest touch to give force to the leading motives. I don't wish to boast," continued Mr. Williams, anxious, as much as possible, to improve the occasion, for it was very seldom he enjoyed the opportunity for so much "dialogue." "I don't wish to boast, but if I state that I've got all the passions cut and dried at my finger's end, I state a fact. Why, you can get love and hate, and joy and sorrow, out of a twist of the brush—all human natur in a bit of camel's hair! I've studied the dodge from the old masters in the National Gallery, I have. Sometimes I asks myself what acting is, and I asks other people, too. There's my friend, Samuels, he's in a large way in the costume line —I asks him sometimes.

"'Vel, Mishter Villiams,' says he, 'I vill tell you vot acting ish. It ish the very best gold lace, and the very best shilk velvet, and plenty of 'em, it ish—try to play Mishter Shakespere vithout 'em, that's all!'

"'No, no, Mr. Samuels,' says I, 'you know what acting is well enough, and so do the actors, only they won't tell—two-thirds of it's paint!' Didn't they have me down at Her Majesty's every night 'Traviata' was on. They couldn't have done the last scene if I hadn't been there. Why, I'll undertake to paint any man, woman, or child, into a galloping consumption—nature itself, in five minutes—that I will. You've only got to hit the cough; I'll manage the face. They didn't call me on, though, when the curtain was down, not they. I ought to have had half the bouquets —that I ought; but I never have had my rights, and I never shall have my rights, the world's a sight too selfish for that."

The further enunciation of Mr. Williams' theory of dramatic art, as developed from his own particular point of view, was interrupted by Miss Temple's maid bringing her mistress the play-book, and a note—Westby's note.

Lilian knew the handwriting, she opened the envelope with eager hands, and glanced hastily over the note.

Oh! why had fate thrown Westby persistently in her path ever since George Newton had left England? Westby was perpetually coming to their house to give information on Newton's affairs—to assure her that things were going on favourably, that Newton would soon be able to return.

Oh, horrible trial! constantly in the company of the man she must forget, noting with reluctant eyes all the loveable points of his character, admiring, to think that it should be a crime to admire, what was noble and good! It was her duty to forget this present fascination, and think of her lover absent in France. And then to hear Westby's praises of Newton, Westby insisting on his right to speak, having known Newton from a boy; it drove her half mad to listen. Once or twice it had been on her lips to make a desperate confession in defiance of all consequences; but fear was mingled with her other feelings towards Westby. There was a cold sternness in his manner which awed her. She fancied that he doubted her constancy towards Newton, and that he was doing all in his power to keep Newton before her mind. She felt that if she broke her engagement, Westby would never forgive her, nay that he would utterly despise her. She had indeed arrived at a sound conclusion, but strive all she could, her feelings were constantly rebelling against it—her reason was convinced, but her heart remained unreconciled, perpetually compelling her to a re-argument of the subject.

Thoughts too hard for constant thinking! She eagerly sought relief in every amusement which the London season afforded. She had found the most absorbing excitement in the preparations for the play, rehearsals, dresses, &c. She had positively dreaded to think that after the night of performance the power of this anodyne would be at an end.

And now Westby's note thrust her once more into her agony of doubt.

Whilst Lilian was looking at the note, Mr. Williams had retired to contemplate the effect of his work from a distance.

"Let me see, there's what the French call 'finesse' in your part, Miss—we must give force to the smiles," and he turned to the table for a pencil.

Lilian tore up the note and flung the pieces from her.

"Why how your countenance do change, Miss! I declare I scarcely know my own work. Pray smile, or I shan't know what I'm about. Thank you, the slightest touch is sufficient," and Mr. Williams again retired to take a survey of his work. "There, now!" he exclaimed proudly,

"I'll warrant when you go on, one half the people will cry, 'perfect,' and t'other half will say, 'it's almost a pity you hadn't had just a leetle rouge'"

"Now then, Williams," cried a voice at the door, "are you ready for me? We're late as it is, and I'm 'discovered,' recollect."

"Come in, cousin Frank," said Lilian.

Mr. Frank Scott entered ready for the stage, save and except his face. Mr. Scott was stage-manager, he was consequently the focus upon which the shortcomings of everybody and everything were concentrated during the half hour previous to the rising of the curtain.

"That ass, Vernon, can't find his boots," exclaimed Scott, taking his seat before the dressing-table, "and he's boring me to death."

Then his eye fell on Lilian.

"Your dress, *ma foi, c'est parfaite:* but your hair, Lilian, that's where it is, after all."

Nevertheless Scott's first impression was correct, the merit lay in the dress—it was the design of an artist friend, and Lilian had paid him with a dozen smiles, and a lock of her pale gold hair. Lilian's faults shall not be hidden, but I pledge myself the price of the design was an honest payment. Lilian, summoning courage, had asked this friend how she should dress.

"Give me a lock of your hair, and I'll tell you."

"By all means," said Lilian, and she drew off her net, and in a moment a great golden wave fell over her shoulders.

"That's very pretty!" exclaimed the artist, with artistic enthusiasm. "I'll get a pair of scissors!" And he drew back the surface hair, rippling through his fingers, and selected a buried lock.

"Snip!"

Mind you, he was no hairdresser, sated with all manner of hair, yet his hands quivered not, and naught was added to the speed of his pulse. To his honour be it said, he had numbered fourscore years, and he had painted charming faces with delicate taste all his artist life.

The lock of hair was pinned to the artist's easel.

"Now, young lady, my colours will lead the eye up to that hair—just try the experiment with your next new dress. Fifty years ago, I should have thought of it twice before I had given you the secret of breaking hearts."

"But, Lilian, do smile!" exclaimed Scott. "You spoil yourself. Trembling, too! Come, come, it won't do for you to be afraid."

"I'm sure I shall break down, Frank. I wish I had never undertaken the part. I always wanted you to let Margaret Vernon do it."

"Absurd girl! You knew every word this morning. Bless me, Williams! I'm not going to play a wild Indian — gently with that red stuff!"

Mr. Williams said nothing, but he was wounded in the depths of his soul.

"As you're here, Lilian, do let's run over the last bit of that scene. I threaten to send De Launay to the Bastile with the *lettre de cachet,* unless you prove to me that you don't love him. You do that part capitally!—I mean just afterwards, when I come from my hiding-place. Confound you, Williams!—don't shove that nasty brush into my mouth."

"If you would only keep your face still for half a minute!" pleaded Mr. Williams, mournfully.

"Hollo, there's Vernon!" cried Scott. "I say, we want the fag-end of that crack scene of yours."

"Mind, Scott, I don't go on the stage till I get my boots," replied Vernon, with stolid resolution.

"They'll turn up, I'll warrant! Here, you're on the right,—pray don't forget that, or you'll spoil my entrance. Now then, 'Is this the village girl?' that's the cue."

"'Is this the village girl?'" mumbled Vernon.

"Go on, Lilian!"

"I beg your pardon, Frank. 'Yes, Monsieur De Launay, the village girl has learnt the manners of the court. Faith in love! who dreams of finding that at Versailles?'"

"Pray go on, Vernon!"

"'Marie, this is some joke.'"

"Joke's not the word."

"I'll bet you it is!" rejoined Vernon, sullenly.

"The word's jest, Mr. Vernon," said Lilian, referring to her book.

"'He will be lost,'" prompted Scott. "We shall never finish at this rate."

"'He will be lost! Merciful Heaven! How shall I save him?'"

"That's right, Lilian! Clasp your hands with despair. (De Launay perceives a ring on Marie's hand.) Now, do get on, Vernon."

"Have you got those boots, Samuels?" inquired Vernon of a Mosaic person who had just entered the room. "Then don't stand star-gazing there! Go and look till you find them!" and Vernon spoke with immense emphasis.

"'Ha! that ring!' Do finish it, Vernon!" cried Scott.

"'Ha! that ring!'" mumbled Vernon.

"Bless me! you really must look in the direction of her hands, or you won't be able to see the ring."

"'Ha! that ring! A gift! Whose? Tell me,'" grumbled Vernon.

"'The gift of the Chevalier De Barras.'"

"'False girl!'" muttered Vernon, hurriedly.

"Pray remember the points, Vernon. You must pause before you say 'False girl!' and look thunderstruck—it's a splendid bit of business for you!"

"The boots ish found!" cried a Mosaic voice, exultingly.

"'Lost? Lost!'" prompted Scott.

"I'd better put them on at once," said Vernon, making for the door.

"Bless the man! Pray finish the scene."

"Very well, then. 'Lost, lost, false girl—farewell for ever!'"

"'Not false! Henri, hear me!'"

"That's right, Lilian! Put in lots of despair—try to grasp his hand—can't you wait one moment, Vernon?—there, that's capital! When you've got your boots on, ring up for the orchestra. I wonder if that confounded fellow—what's his name—Markham's friend—who plays

the cornet, has got back from his Richmond dinner ?—mind, we won't wait for him."

And Vernon, released at last, flew with ardour to his boots.

"Now for it, Lilian ! The bookcase will do for the window. Here, Williams, take the book and prompt !"

"'Saved, saved ! but, alas, how saved ?'"

"Clasp your hands over your face, Lilian. 'Madam, I have the honour to place this document in your hands.'"

In default of a "property" letter, Scott caught up the envelope of Westby's note.

"You must almost snatch it from me—that's right ! Now tear it up passionately."

But Lilian thrust the envelope into her bosom.

"'Behold my generosity !'" said Scott, continuing the dialogue. "'Monsieur De Launay was a rival, but I forgive him. He was a rival, but you, Marie,—you have cured him of his love, ha! ha ! The noble-minded De Launay, that mirror of chivalry ! think you he will care for the woman who has been false to her word?' By Jove, Lilian, you never did the bye-play as well as this !"

"Fust-rate," said Mr. Williams, critically, but inwardly he awarded half the praise to himself and the paint.

"Edge up closer to the chair and table, Lilian, —that's it ! 'Ha ! ha ! beauty to win De Launay back ! and he only cares for honour and truth. You will live in his mind, Marie, as the vain coquette —the false one that trifles with the heart. And think of it, Marie, he will turn from you thus, when you cross his path.'"

"Where's Scott ?—they want him !" cried an excited "super" rushing into the room.

"Here am I, Fred,—coming directly. It could not be better, Lilian ; that cry when you fell into the chair. It will bring down the curtain splendidly !" And Scott hurried from the room.

There was a voice of lamentation in the passage —the voice of Vernon—a voice of sympathy also, —the voice of the Mosaic person.

"They're a size too small !"

"'Pon my vord, dey sall stretch."

"I'm like a cat in walnuts. Oh ! and that cursed corn."

"Never mind, Vernon, use is second nature," cried Scott. "You won't feel it when the curtain's up."

Mr. Williams was left in the room with Lilian and her maid. Lilian's head still rested on the table, clasped in her hands.

"Fust-rate !" again exclaimed Mr. Williams, lost in admiration at the effect his handiwork had produced.

"Frank," murmured Lilian, "I can't go through with it—it will kill me." There were tears in her eyes.

"Bless me, Miss," said Mr. Williams, "you needn't feel the part like that: it's all on the outside, like my paint."

"No, no, pray tell them I can't do it," sobbed Lilian.

"But the curtain's risen," expostulated Mr. Williams, "you will be on in a few minutes, you are only a little nervous," and he addressed some confidential words to the lady's-maid, who left the room.

"Why, Miss, I've seen many a great actor," continued Mr. Williams in a consolatory tone, "times upon times, shake like an aspen, and then go on and carry the house by storm."

"Miss Temple ! Wanted directly," cried a voice in the passage.

"Just drink that, Miss," said Mr. Williams, evincing quite a paternal feeling after the manner of the stage.

"It's salvolatile," said the maid. "I'm sure it will do you good."

"Miss Temple !" shouted the voice.

"I'm coming !" cried Lilian, rising with effort from the chair, "where's my handkerchief, Jane ? Do I look as if I'd been crying ?"

"One moment, and I'll touch off the tears," said Mr. Williams. "So, so, your face is perfect !"

"The stage is waiting for Miss Temple !" and a frantic "super" dashed into the room.

(To be continued.)

IRELAND AND HER QUEEN.

"Punch" has seldom given us a prettier picture of the times than when he showed us the greeting of the Queen to Ireland,—that engaging damsel, comely and neat, and possessed of a noble pig. While everybody liked that sketch, it went right to the heart of old people who could not forget, if they were to live to the age of Methusaleh, the wringing pain caused by the idea of Ireland at the beginning of the century. I am not going over the story from that time to this. Its leading events are not likely to be forgotten by any who have ever cared about the subject at all. All that I desire is that we should just catch a glimpse of the aspect of that strange country at three or four periods since the Union, in order to see the course of the transformation, and learn the natural lesson from it.

In deriving lessons from events, people, it is true, commonly learn, or fancy they learn, just what they knew before ; in the same way that people usually see what they are looking for, and always fail to perceive what they had no conception of : but there is one hint so very broadly conveyed in the recent history of Ireland that it must stand second in everybody's view, whatever favourite notion may come first. When, in an election among a crowd of candidates, one candidate has everybody's second vote, while the first votes are scattered, that candidate heads the poll; and in the same way, the second lesson that we all learn from Ireland being the same, however we may differ about the first,—that is *the* lesson. It is noble enough to hold the very highest place in any scheme of political study. It is—a warning against political despair.

There has never been a time since any organised polity existed when such a lesson was not needed. There is always some country or other where matters are in such a bad state that it is difficult to see how they can ever be set right ; and at present it is difficult for political students who have any benevolence in them to keep up their spirits about half-a-dozen countries

in Europe,—to say nothing of the gross ravages of civil war, in far eastern and western quarters, —in China and in America. But, after being in the Queen's train in Ireland last month, it becomes more possible than before to hope good things for even Naples and Sicily, — for even Russia and Poland. The lesson for just-minded rulers and for a patriotic people is, "Never say die!"

We need not expect the lesson to be made use of much beyond our own country, because the state of the case is not understood where Ireland is most prated about. Austrians, French, Russians, and Americans, assumed that Ireland was still, and always had been, cruelly oppressed; and that the word oppression comprehended all the mischief, and was the key to the whole difficulty. They can hardly go on thinking so any more now; but, up to this time, ninety-nine out of a hundred American and European sympathisers have had no other association with Ireland. The Irish, having a passion for liberty, were cruelly oppressed:—that was the case in brief. If it had been so, the task of the rulers of Ireland would have been comparatively easy: but the points of the case were nearly the reverse of those stated. The Irish people are not supremely fond of freedom; and they might, at any time within this century, have had much more political liberty and privilege than they ever realised.

The present generation may imagine something of the misery and turbulence of fifty years since when, in the chronicles and memoirs of the time, they come upon the occasional wish that the Green Isle was submerged seven feet in the green sea. The reason why all governments, and all thoughtful men, were at their wits' end what to do was, that Irish human nature was unique, and, as far as appeared, unmanageable. If the people had been really lovers of freedom, they would have been lovers of law. The most practically free nation is always a law-abiding nation. But the Irish have a constitutional tendency to illegality which is embarrassing beyond measure to any kind of government; and the more from its being accompanied by a passion for meddlesome law-making in favour of classes. The same government had to rule the English, who stand by the laws as their own work and their own precious possession, and therefore give little trouble when legislation is once accomplished; and the Scotch, who can argue, and expatiate like so many special pleaders on points which they treat as texts from a talismanic book; and the Irish, who have had but too much reason to protest against disqualifying laws, but who also were exceedingly prone to commit treason, murder, and arson, while clamouring for new laws to settle every social transaction between man and man. Amidst all the mouthing of their orators about liberty, the Irish people had no sort of notion of political ethics. They meant, when singing their liberty songs, or giving three or nine groans for tyrants, that they wanted each to have his bit of ground for his own, and to send a member to a Dublin parliament to make Ireland somehow great and glorious, and do something for *him*. It was not that the peasantry (and there was scarcely anything that could be called a middle class) were clownish, ignorant, and without political imagination, like the English rural labourer of sixty years since. The people, young and old, were brisk and sharp, fond of education, and full of notions of native kings and chiefs, and laws about land: but they thought of laws only as a privilege, and not at all as involving any duty. So they either pined or clamoured, according as they were or were not allowed public speech, and talked big about law and liberty while they were murdering landlords and agents, and houghing cattle, and burning homesteads, and smuggling, and taking even more pleasure in defying the laws they lived under than in clamouring for more.

From this state of things it necessarily followed that all the world, but a handful of sensible Englishmen, took for granted that the woes of Ireland were due to political causes; whereas the most radical mischiefs were social and economical. How this came to pass I need not now inquire: it is enough that it was the fact even in those dark political days when Pitt and his successors found it impossible to fulfil the promise about Catholic emancipation under which the Union had been agreed upon. Shocking and shameful as were the political disabilities of sixty years ago, they were of less importance than the social mischiefs which caused prevalent poverty and occasional famine, with the crimes which belong to them. A well-fed people, encouraged in industry, could have certainly obtained political equality in a short time; whereas no amount of political liberty could have released the soil from the burden of a crowded population which it could not feed. Under such circumstances, Ireland might well be the nightmare of successive cabinets, the dread of every parliament, and the cause of heartache to every kindly-hearted man.

We did not travel much in Ireland in those days. It was a terrible thing to encounter the beggars: the inns, horses and carriages were not very tempting. There were no roads to some of the finest districts of scenery; and the aspect of decay was too dreary to be encountered without stringent reasons. Except in a few ports there seemed to be no trade: the sea was left unfished (as it is too much at this day), and the great mansions were crumbling into ruin, as their lands lapsed into waste.

What the traveller did not see, when any artist or eccentric hunter of scenery ventured to the wild glories of the North and West, was worse than anything that met his eye, even though his car was mobbed by a crowd of half-naked and hungering women and children. There were tithe-proctors in ditches having their ears cut off: there were cabins on the moors where peasants met after midnight, not daring to refuse the summons thither, and where it was appointed by lot who should shoot an obnoxious agent, or the landlord himself, and who should batter out the brains of an interloping tenant, or cut out the horses' tongues, or hough the cows. There was the slavery of the men on whom the lot fell, or who dared not refuse the commission; and of the neighbours who saw the deed done, and dared give neither notice beforehand, nor information afterwards. There were Protestant clergymen sitting in their glebe

houses, rendered idle and poor by every sort of obstruction, and wretched by popular dislike: and there were Catholic priests who knew, in virtue of their office, how political disappointment was made use of to sink their flocks deeper into crime. There were hedge-schools, where tattered boys were eagerly learning arithmetic and land surveying, that they might enter into the competition for land and land offices, which was their only notion of getting a living. There were hollow places under the turf of the moors, betrayed only by a thread of blue smoke, where illicit stills were at work, and dogs were in training to carry bladders full of whisky through the beat of the exciseman in the night. There were hovels without number, where parents were compelled to give their children the potatoes which they had promised as rent. The little ones could not starve to-day, whether or not they were to have a roof over their heads to-morrow. There were wastes on the mountain, and wild sands by the sea where men stealthily collected in the dusk or at daybreak for drill, with pike or fork or scythe, when firearms could not be got; and frantic was the joy, or desperate the rage, according to the report of scouts or prophets, as to the approach of the French, or the putting off of the invasion. There was emigration in those times, though we are too apt to forget it. Not only did Irish mowers, reapers, and hop-pickers invade our agricultural counties in the season in numbers (the like of which will never be seen again), but several thousands of the peasantry yearly found their way to the United States or the British Colonies. In America they were very welcome, in the early days of railways and canals. The new comers, it is true, died off fast, of drink, miasma, and needless discomfort; but the lowest of them valued education for their children; and, as education is universal in the free States, the next generation were well worth having; but the characteristic of the Irish in America was found to be, as it is now, their intolerance, and preference of despotic to free government. John Mitchel is a true representative of his countrymen in America in his aspiration after "a goodly plantation, stocked with fat negroes." As the emigrants dispersed over the world, they spread everywhere the notion that their people were made slaves of by England, and that all their woes were owing to political causes. At this moment a sound is ringing in my ears, one of the most painful I ever heard,—the passionate, peevish cry of the widow of Theobald Wolfe Tone,—an aged lady living at Philadelphia, who poured out her Irish politics to me, exclaiming, on behalf of her country, "Let her alone! Don't touch her at all! Only let her alone!" It was not a case for reasoning. The Catholics were then emancipated; and the Whig government was entering on its course of beneficent rule; but the widow of the rebel of 1798 had no patience to hear of good news for Ireland if it came through English hands.

I shall ever believe that to Thomas Drummond, more than to any other human agency, is the regeneration of Ireland due. An undemonstrative Scotchman, he seemed animated as by a new soul when he had warmed in his Irish office; and it might well be so; for he had set before him the object of saving Ireland, whatever became of himself. Ireland was saved, and he perished under the burden of the work. To those who knew him before he crossed the Channel, it is very moving to see his statue at Dublin,—with the face full of the well-remembered intellectual sensibility, but so thin and worn! In dying, he declared that he died for Ireland; and it is true. Those who know him by nothing else remember him by his saying—so simple to him that he could not conceive how it became so celebrated,—that "Property has its duties as well as its rights:" and it will be fully recognised hereafter that he inaugurated the rule of indulgence which alone could have saved Ireland,—so deeply sunk as she was. The rule of the Whig government, worked by Mr. Drummond, and exemplified by the high officials who did the demonstrative part, was the turning point of the fate of Ireland.

There was a new phase, but not a much more promising one to superficial observers, when O'Connell, having obtained Catholic emancipation, found himself unable (supposing him willing) to withdraw from his function of Agitator. I have never been able to think well of O'Connell, more or less. Men of all politics desired to like and admire him, if possible: but I, for one, never could see that he answered to any sort of test of sound character, political or moral. He had his retribution for his sins in the tribulation of his later years, every one of which plunged him deeper in the embarrassments of false promises, timid collusion, and public pledges which he could never redeem. Nobody now supposes that latterly he believed Repeal possible, or in any way desirable; yet he had not courage to avow the truth: and his humiliation extended even to sanctioning each man's dream as to the results of Repeal. He obtained the support of the Irish peasantry by permitting them to believe that "Repale" meant the possession of land by each man in fee simple. A glimpse of Ireland at that time, twenty years ago, shows us an altered scene, but one as full of peril as ever, except that plans of regeneration were maturing at the Castle at Dublin.

There had been abundant proof within a few years that the loyalty of the Irish was to persons more than to institutions. It had astonished us all in 1820 that George IV., who would not grant Catholic emancipation, and had been no benefactor to Ireland, was received there with an enthusiasm which seemed perfectly senseless. We might have learned more than we did from the fact that the mere presence of the king could so work upon the people. Nearly twenty years later, the people were hero-worshipping again; and their heroes were changing the aspect of Ireland for the time. Father Mathew had obtained a hold on the popular imagination in one way, as O'Connell had in another. In Ireland we then saw the distilleries shut up, and the spirit-merchants turning to other occupations. We saw the temperance medals on tens of thousands of necks and breasts; and where they were worn, the children were getting clothed, and the cabins furnished, and the parents rising out of debt and difficulty. But it was really worship, and therefore dangerous. Father Mathew,

like O'Connell, let the popular imagination run wild, for the sake of influence, and the aims to which influence was directed. The people believed, and they were not contradicted, that Father Mathew healed the sick, and had raised at least one from the dead. He afforded thus the material of a Temperance host, which O'Connell drilled as an army. Those were the critical days when an indulgent policy was happily adopted, instead of a coercive one; and when the right choice was made between giving Ireland opportunity to be a convert, and calling her to account as a rebel. She was allowed to hold her monster meetings, where an army of sober peasantry marched before O'Connell, really believing him to be the destined king of Ireland, while their mothers and wives wept rapturous tears, in full faith that there was now to be no more poverty for anybody; no more evictions from field or cabin; no lack of potatoes ever again; but plenty, and glory, and liberty for every man to do as he liked, under King Dan—his own chosen prince. That mob-prince, meantime, carried a heavy heart within him. He was as a man half-way up a precipice, where he finds no path nor footing. His uncertainty and fear became very obvious, and they carried him to his grave. His influence was much lessened before he died, and so was Father Mathew's. There was nothing to sustain the hero-worship in either case; and the chief practical result was the evidence that the way to govern the Irish was through the loyalty of the popular heart, and not by making them arbiters of their own political rights. Even O'Connell, to whom they were loyal so long, failed because he could not give them the bribes which he annexed to political claims; and no agitator since his time has succeeded at all. When Smith O'Brien was in the height of his hopeful delusions, Irishmen who knew their countrymen said he and his comrades must fail: no political Protestant could ever lead discontented Catholics on to a successful rebellion. The reason was, that the people wanted a hero to worship first, whatever notion of rights might come afterwards; and no political Protestant can be an idol in a priest-ridden Catholic country.

How far it might have been different if O'Connell had lived, there is no saying; but Irish history took a new turn when his vigour and influence declined, and began a new chapter after his death. There was the national system of education—a blessing which Ireland (and the whole empire, as interested in Ireland) owes primarily to Lord Derby. Half a million of the children of successive generations have been civilised and enlightened by that institution; and the Irish passion for education has happily counteracted the influence of the priesthood so far as to secure the signal success of the scheme. The Bishop of Oxford saw with delight, the other day, what those schools really are, in regard to the intelligence, and free, happy, and orderly bearing of the children, and the good understanding which exists among households of teachers of differing religious faiths. But, to estimate the full benefit, one should see what these schools do in the remoter parts of the country, where the priest is kept in order, and the rebel is laughed at, and the incendiary is restrained, and all wildness turned into reason, by the mere enlightenment of the children as they grow up. Bigots on both sides have made great difficulty; but the system survives and flourishes, and the period of Irish delusion from ignorance is evidently closed.

Of the famine, I will say only that it left the country covered with refuges for the helplessly poor. The workhouses were not mere roofs for the shelter of the destitute, nor abodes of shame, as they are elsewhere. There was no disgrace in the destitution caused by such a calamity as the famine and its consequent pestilence; and the workhouses operated in somewhat the same way as the schools. They were an interesting feature to the traveller who went to see what Ireland was like when the hungry were fed again, and the dead were buried. There the people learned to wear whole clothes; there habits of cleanliness and neatness were formed; there boys were trained in agricultural and girls in domestic arts; and the multitude of orphans left by the fever found a not unkindly parent in the State. The system could not have worked, however, without another great change. While the land lay waste under the burden of debt, and its owners could not live on it, and Irish capital was deposited in the imperial funds at low interest, while the country was perishing for want of it, there could be no actual poor-rate which could support the lowest class. The famine had proved the absence of a middle class at all in proportion to those above and below, as it had exhibited the mischievous lack of roads to connect one community with another. Everything wanted consolidation with other things—one class of society with another—one locality with another—trade with agriculture—labour with capital; and while the disintegration existed, even the feeding and clothing the destitute from the public purse could not go on. The remedy was applied when the land was released. There never was a more conspicuous instance of success in social administration than that of the Encumbered Estates Act. When it had come into full operation, it was really worth while to go to Ireland. It is true the country was studded all over with gable-ends where cabin-roofs had fallen in, and nettles and briars grew over the cold hearth-stones. It is true the churchyards were very full, and the villages very empty, in the dreariest districts. One's heart was rent with the cry of parting, when groups of emigrants mounted the public cars. The priests hung about the shores or the lanes, as idle as the Protestant parson had ever been, and far more miserable. Their flocks were dispersed; their living was gone; and their neighbours had betaken themselves to a land where they were pretty sure to turn heretics. These incidents were mournful enough; and there were complaints that more and more cattle were grazing where cabins and potato-grounds contained inhabitants before. But there was an abundant set-off against all melancholy incidents. The beggars had diminished yet more than in proportion to the decrease of population. The men in the fields were earning double wages, and working better accordingly. The labourer who, at sixpence a-day, had lain down on his back as soon as the

agent was out of sight, now, at a shilling a-day, took no such rest till his work was done. Boys took the stranger to see a curiosity with much pride; and, when in presence of the marvel, told him that the plant was called a turnip. The women and girls, who had supported the men after the dislocation of industry from the famine, were still sewing away, morning, noon, and night, on their door-sills, at the embroidery sent them from Scotland, as well as from Belfast; and 400,000 of them were earning between 80,000*l.* and 90,000*l.* per week. The rural families all over the country showed the effects in their faces of better diet than they had known in the days of the dear old potato; and in their spirits they testified to a new experience of hope and comfort having fairly set in.

There were still occasional agrarian murders; and strangers formed their opinion of the priests accordingly, as cognisant of the whole mind of the Catholic peasantry; but by that time the explanation was ready that the power of the priests was no longer what it had been: in fact, the men did not, as a general rule, go to confession, if the women did; and if the women were not told secrets, the priests did not know them. On dark hillsides, and in wide wastes, everything was brightening. Prostrate fences were set up again; mansions were rebuilt; weedy fallows were manured and tilled, and stock was turned in upon the neglected pastures. There was certainly a plague of ragwort and loosestrife over the land; and the stench of steeping flax showed that wasteful old methods were still in use; but a Scotch farmer here and there was waging war against unthrift of every kind; and flax-dressing by machinery was making its way.

The best thing was that the Scotch and Englishmen were so few, though the released estates were daily taken in hand by new owners. The Irish capital in the imperial funds was flowing back, and spreading fertility like a stream in India which has gone astray, and is led back to irrigate a desert, and make it blossom as the rose.

It was at that time that the Queen made her first visit to Ireland. Smith O'Brien, Meagher, and Mitchel, were undergoing their exile, and were supposed to have many sympathisers at home. The royal authority had been insulted and defied by the existing generation; and there had been reckless people, at home and abroad, to assure the credulous Irish that the famine and the pestilence had been somehow the work of England. Every gift from England had been haughtily despised as a mere instalment of a right. Every scheme of relief had been clamoured against; and all that insolence could say and do through an ignorant Catholic hierarchy had been tried by the priests, and imitated by the people within their influence. No wonder the Queen was nervous on landing. She who, like her brave race, is absolutely dauntless on all emergencies, and when she comprehends the elements of the case, was fluttered by the uncertainty as to her footing in Ireland; and her first steps on Irish soil were somewhat unsteady; her glance was anxious, and her countenance full of solicitude. But it was all right. The people had once more an idol. Reverence and love greeted her whichever way she turned. None of us will ever forget her departure. She was worshipped as she went to the pier, and as she stepped on board her yacht; and cheers broke forth again and again as she stood on deck while the vessel moved off. When the distance increased, the sudden sense crossed her of the contrast between her feelings in arriving and departing, and she ran along the deck, and up the paddle-box where her husband was standing, and threw out her handkerchief to the wind. Never was there such a roar of delight, among her many greetings from her subjects, as went up when the act was seen from the far distance. The Irish and their Queen felt that they must and should meet again.

They have now met again. In the eight years that have intervened the progress of the country in all ways has been very great. Some complain of the diminution of numbers since the census of 1851; but there has been a due increase of people, though they are living far away. They are prosperous in the colonies; and, as for those in the United States, they are coming back now that their new, and not their old, country is the scene of civil war and social hardship. We hear of sixty embarking by one ship, and of hundreds converging towards the ports, to get back to their families at home, instead of following the fashion of bringing them out. There is plenty of work and wage for them in the old country; and they will find affairs wearing a new face. The workhouses half empty or more, and a demand for labourers from the remnant there; the towns showing new markets and shops, and improved public buildings; the ports full of shipping; the tillage expanded by a million of acres in ten years, and the live stock by five millions of money; the wretched cabins gone by thousands and replaced by decent dwellings; the people ashamed of rags, and accustomed to a varied diet; the constabulary lessened in number, the military barracks standing empty, the prisons not half full, and the judges of assize putting on white gloves instead of the black cap; these are the features which will surprise the returned emigrants, and make them ask whether this is indeed Old Ireland.

The Queen landed this time with gravity and amidst silence; but it was because her subjects sympathised with her personal griefs, betokened by the deep mourning which she wore. When they discovered how pleased she was to meet them they gave her the heartiest of greetings; and the enthusiasm knew no bounds while she remained in sight. It is said that she contemplates having a residence among the beautiful scenery of the west—and we shall all desire that she may. If she had twenty palaces elsewhere, it would still be wise to have another in Ireland. Her mere presence and sympathy are a sufficient ruling power in the stage which Ireland has reached. She smiles upon the comely Ireland in her state of buxom health and comfort; and comely Ireland modestly clasps the royal hand, and looks into the Queen's kindly face. Such a meeting every year or nearly would cheer the hearts of both.

What the historical commentators and political critics of France and Austria, and Russia and America, think of this meeting, I do not know;

and none of us will care. They have lost a topic for declamation; but Europe and America seem likely to yield others. If they want a type of the rebel and the beggar, they must henceforth look elsewhere than to Ireland.

From the Mountain.

THE NEW ZEALAND DIFFICULTY.

It seems as if we were never to solve the problem of justice to New Zealand. Based upon a wrong principle originated by the missionary body, and by their influence brought to bear upon the Colonial Office, we have been endeavouring to accomplish an impossibility—to inhabit, cultivate, and reclaim a country in which the native race are to be left a distinct people, and to live under British rule, and yet remain upon amicable terms with the original race who are free from such rule.

The first missionaries, finding the Maori a docile, intelligent people, ready to embrace Christianity, give up their land for a fair price, and trade with the new-comers, rejoiced in the fact that they had discovered a spot far removed from opposing influence, where they could experiment at will, preach, convert, and govern to their hearts' content—a model-farm from which at given periods clothed and Scripture-quoting natives could be sent home to excite sympathy and draw subscriptions at Exeter Hall, &c.

Into this hot-bed of missionary handiwork the intrusion of such a body as that of the Joint-Stock Company of New Zealand emigrants was looked upon with horror. Deputations of churchmen hastened to the Colonial Office, denouncing the colonists as invaders and exterminators. Unfortunately, the company had acted without government sanction, concluding that when their good intentions became known they would readily obtain the government charter; and this, no doubt, would have been the case had not the opposite interest been so strong at the moment. A governor was hastily appointed, and Captain Hobson, R.N., chosen to fill the responsible office. Subsequent to his arrival, a meeting of the natives inhabiting that portion now known as Auckland was convened, a treaty drawn up and presented to them for signature, the purport of this treaty being that these men, as representatives of the whole body of natives, ceded the sovereignty of their country to the British crown, with the sole right of land-purchase. To this latter clause the chiefs objected, insisting upon their right to sell to the highest bidder. After much discussion, an alteration was granted, verbally, *but not inserted* in the document, which was duly signed. It is this treaty which has been most improperly styled the Magna Charta of New Zealand—a treaty which, at the outset, involved a breach of faith.

The first effect of this document was to render null and void all purchases effected by the "Joint-Stock" Company, whose agent, Colonel Wakefield, had already founded the provinces of Wellington and Nelson, comprising the country bordering Cook's Straits. Feeling the instability of the company acting as it did, independently of government sanction, Colonel Wakefield took every means in his power to investigate the native claims, and obtained a large tract of country at a price which, though in the eyes of the present generation a mere absurdity, was at the time, and in accordance with the nature of the inhabitants, deemed equivalent. When intelligence of this reached the North, agents were immediately despatched to obtain the signatures of the local chiefs; nor was this done openly, but so secretly, that it only came to the ears of Colonel Wakefield by accident, a chief telling him "his Queen had sent him a blanket for making his marks on paper."

Many of the missionaries were good and praiseworthy men, who acted in accordance with their noble calling; but there were others, and unfortunately the majority, who, forming a party, have in our opinion been the most determined opponents the emigrant has had to deal with, and who, while appropriating large tracts themselves, did everything to prevent the same privilege being extended to experienced men who came out prepared to make the colony their home, and transplant a veritable offshoot from their dear old land.

The cause of each subsequent disturbance that has agitated the colony may be traced to this foundation. Tribal rights have never been clearly defined: difficult they are, no doubt; but the first act of the existing government should have been to elucidate this, and establish a rule which should be incontrovertible.

During the governorship of Colonel Gore Brown, a certain league was permitted to expand itself, since known as the King's movement, at the time consisting of such opposing ingredients, and presenting no apparent dissatisfaction to government, that it was even hoped it might lead to the elevation of the social interests and native progression. But although such an opinion was held by the clerical, and consequently the government party, the very reverse was feared and expressed by the colonists, who saw in the league germs of future trouble and anarchy.

The two elements upon which the partisans of the league hung were these: the assertion of their rights to be ruled by a king of their own nation, who should, they said, reign conjointly with Queen Victoria, and the prevention of land-sales. Taking a retrospective view of the progress and history of the colony, it certainly appears a most suicidal act upon the part of government not to have crushed such a power in the bud, yet so it has been. The Maories were petted and pampered as a wronged people, and allowed to play at having king. The result has verified the prophecies of the colonists, who have been lately most unjustly charged by members of the Church party, with fostering the very movement they alone condemned; it has been asserted that they desire the extermination of the native race, than which nothing could be more opposite to their feelings and even self-interest. It is the colonist who would gladly throw down the barrier, kept up by the clergy, and treat the Maori as a brother-subject of a glorious constitution, and this is what the Protection Society so vehemently oppose. The Maori would then be absorbed in the flood of emigra-

tions; his nation would become an historical relic; his language a dead-letter. The whole policy of keeping them a distinct people would be rendered vain, and the incalculable labour and expense the missionaries had been at, by translating the Scriptures, unnecessary. So, according to the Missionaries, the Maori must have separate laws, language, and rights.

The renewal of hostilities has, we think, been made too much of; not that we would anticipate any lasting good from the peace so hastily patched up before the recall of Colonel Gore Brown, and re-appointment of Sir George Grey. We are not at peace, and never shall be until a thorough revision of the system of government takes place.

Sir George Grey's former governorship was highly popular, and he has been fixed upon as the only man likely to quell the disputes; time only can prove whether the reappointment is judicious or not: he understands the Maori character, as well as their language, songs, and legends; but he must adopt a different policy from that he followed formerly. He is returning to reap the harvest he assisted to sow, and it remains to be seen whether he will have the power to gather the sheafs into the garner and destroy the weeds of disunion and disaffection for ever. Isabella E. Aylmer.

THE LASS OF RICHMOND HILL.

Who was the Lass of Richmond Hill, and who composed the song and the words of it? This is a question which has been often asked, and not very satisfactorily answered, although many versions have been given, especially by some of the old inhabitants of Richmond. Amongst others, a certain pretty Miss Smith, who lived on Richmond Hill, and was a writer of poetry, was thought to be the *Lass*, and for this reason. Having one day made some purchases at a shop in Richmond, she was asked where they should be sent. She gave her name and address, but added, "I am better known as the 'Lass of Richmond Hill,'" an answer probably arising from a little poetic vanity.

The following anecdote, related by Sir Jonah Barrington in his "Personal Sketches," is amusing enough; but it must be added that what he tells us is not always to be depended on. If it were so, he has cleared up the difficulty as to the identity of the Lass of Richmond Hill.

He informs us that on the trial of Roger O'Connor, on a charge of robbing a mail-coach, a distinguished Irish barrister was engaged, Mr. Leonard McNally, author of a work on the "Law of Evidence," and also of the song of "The Lass of Richmond Hill." He was a great poetaster, and having fallen in love with a Miss Janson, the daughter of a very rich attorney of Bedford Row, London, he wrote on her the celebrated song of "The Lass of Richmond Hill," her father having a house in that place. The young lady could not withstand this, and returned his flame. She was absolutely beautiful, but quite a slattern in her person. She likewise had a turn for versifying, and was therefore altogether well adapted to her lame lover, particularly as she never could spare time from her poetry to wash her hands, a circumstance in which McNally was sympathetic. The father, however, notwithstanding all this, refused his consent; and consequently McNally took advantage of his dramatic knowledge, by adopting the precedent of Barnaby Brittle, and bribed a barber to lather old Janson's eyes as well as his chin, and with something rather sharper than Windsor soap. Slipping out of the room whilst her father was getting rid of the lather and the smart, this Sappho, and her limping Phaon (for McNally was lame) escaped, and were united in the holy bands of matrimony the same day. She continued making, and McNally correcting verses, till they were called out of this world. This curious couple conducted themselves both generally, and towards each other, extremely well after their union. Old Janson partly forgave them, and made some settlement on their children.

We regret that only a portion of this anecdote is true. Mr. Janson certainly had a house at Richmond, and Mr. McNally married his daughter, but the rest of the story may be considered as the result of the propensity of Sir Jonah Barrington to substitute fiction for truth—a second Sir Nathaniel Wraxall.

The fact is that Mr. Upton wrote the song of "The Lass of Richmond Hill," and the music of it was composed by Mr. Hook, the father of Theodore Hook, although it was for a long time popularly ascribed to George the Fourth, then Prince of Wales, who was a fine musician. Mr. Upton composed many other songs for the convivial entertainments at Vauxhall Gardens, where they were sung by Incledon: they are probably familiar to most of our readers.

Edward Jesse.

THE COCKHORSE REGIMENT.

When the Thirty Years War was finally brought to a termination by the treaty of peace of Westphalia, which was concluded at Nüremburg in 1560, the civic authorities of that place ordered in commemoration public rejoicings of various kinds,—banquets, balls, fireworks, &c. But among all these public diversions, none was more distinguished for singularity and originality, and perhaps childish simplicity, than the procession of lads and boys on sticks or cockhorses. Thus mounted they rode, regularly divided into companies, through the streets, and halted before the hotel of the Red-Horse, where was staying the Imperial Commissioner Octavius Piccolomini, Duc d'Amali. The duke was so pleased with the novel cavalcade that he requested a repetition of the same procession at an early day of the following week, which they performed in much larger numbers. On arriving before his hotel, the duke distributed amongst them small square silver medals (of the value of about 5*d.* each) which he had in the interval caused to be struck. The coin represented on the obverse, a boy on a hobby-horse with whip in hand, and the year 1560 was inscribed in the centre, while the reverse represented the double eagle and armorial bearings of Austria, with the inscription: "*Vivat Ferdinandus III. Rom. Imp. vivat!*" M.

THE ANGEL AND THE INFANT.

(FROM THE FRENCH OF JEAN REBOULLÉ, OF NISMES.)

AN angel over a cradle stood ;
His visage shone with a radiant gleam ;
And he seem'd on his own fair form to brood
In the mirror pure of a crystal stream.

" Oh, come to my home, sweet babe so fair ! "
He murmur'd ; " Come, come with me now !
Ah, we shall be happy together there ;
The earth is unworthy of such as thou.

" Its gladness is never without alloy ;
Some pang from its best delights will rise ;
A wail still rings through its shouts of joy,
And all its pleasures are clogg'd with sighs.

" O'er every feast is the fear of doom ;
No sky so clear and serene, but may
Be blacken'd and riven with storm and gloom
Before the dawn of another day.

" On that pure brow shall the trouble pass
Of hopes deceived, and of haunting fears ?
Shall those blue eyes be bedimm'd, alas !
By the bitter rain of regretful tears ?

" No, no ! dear babe, through the fields of space
Thou wilt fly with me to a brighter sphere ;
God will not exact, in His boundless grace,
The days that else thou hadst linger'd here.

"No soil of sorrow, no taint of sin,
From thy sojourn here on thy robes shall rest,
The smiles that usher'd thy young life in
Shall follow thee home to yon region blest.

"On thy forehead no cloud shall a shadow fling,
Nor the darkness there of the grave forecast;
Of so unspotted and pure a thing
The loveliest morning is still its last."

And, slowly unfolding his wings snow-white,
The angel ceased, and aloft he fled
To the blest abodes of eternal light.
Alas! poor mother! Thy boy is dead!

THEODORE MARTIN.

RAILWAY RISKS.

HORSE FEET AND ROAD—ENGINE FEET AND RAILS.

SOME years back, a man of a studious habit of mind looked in at the door of a veterinary establishment where a horse was undergoing a curious process called "firing," that is, the application of heat along the course of the tendons leading to the feet. Desirous of learning what it was for, he applied to a bullet-headed man in a sleeved waistcoat, who had just made a speech indicative of considerable humanity to horses, by way of reproof to a subordinate, "Is that the way to treat an oss, ye hass you?"

Thus delivered of his indignation, he turned to his questioner. "Ye see, sir, as how an oss in his natteral state can gallop over the turf for ever and ever, and never hurt hisself, and doesn't want no shoes neither. But ven the poor hannimal is put on to these here Lon'on roads, and, wus still, these here pavements, it stands to reason that if he hadn't no shoes he'd soon wear off his hoofs; and then with a load of iron, at a sharp trot, don't his poor feet come down like sledge-hammers, neither? If it wasn't for his natteral springs in his legs and feet, Lor' bless ye he'd be clean done up in a month. But, anyhow, his springs gets vored out and dummied like, ven he's been two or three years on the stones, and he hasn't no more feelin' in his feet than that fellow I've been a blowin' up, has in his head. So ven an oss gets so, he's groggy like, and doesn't know how to put one foot properly before the other, and he'd pretty soon be goin' down to prayers. So then they sets to, to fire his legs, and that brings back his feelin' like, and he's more safe again."

"In short, they re-harden and temper his leg-springs?"

"Eggzackerly, sir! But not to say as how they are ever so good as new, ven he'd only turf to gallop over, and not granite."

Time passed, and our student one day rested at a level crossing by the side of a railway, while train after train passed at high speed.

"Whence arises this thunderous sound, and whence this semi-earthquake?" were the reflections of our student.

Alternate contact and non-contact between the wheels and the rails, multiplied in effect by the speed, and resulting in heavy blows. There was no other solution. The wheels did not roll—they jumped. Rolling would be a continuous pressure only: jumping caused percussion; percussion caused noise.

"What caused the jumping?" was his next thought. Impediments by irregularity of the rails, and sledging movement instead of rolling movement of the wheels.

What, then, was the remedy? First to make the rails smooth and even, and bed them continuously in non-deflecting timber, and then to make the wheels like a horse's foot: to apply elastic resilience as near as possible to the rail.

And so the student became an inventor. Friends advised him not to pursue so unremunerative a path, but it was a "labour of love," and so he persevered. "Eureka!" he exclaimed one day, after calculations and experiments without end, which resulted in a system of rail thoroughly new, and which was universally scoffed at. "Eureka!" he exclaimed a second time, when he produced a wheel to match the rail, and which he called a "horse-foot wheel."

The mechanism was achieved and material difficulty surmounted, but the engineering of men's minds was a far less easy matter. The inventor could not get listened to. He could not, like the Ancient Mariner, find

The man that must hear me.

So he tried an assemblage of many men, and wrote a paper which was read or sung before the British Association, which then held their sederunt in Glasgow; and then it was laid on the table, or under the table, and men knew it no more.

Still the inventor had faith in himself, and worked on. He became a peripatetic besieger of men about railways, who, like the Roman Centurion, had power to say "Go, and he goeth;" but none of them said to the inventor, "Come!"

But one day he fell in with a man in railway authority with whom he had formerly had a long dispute. He showed him drawings of both wheel and rail. After examination of both, the authority said, "I like the wheel; but the rail will not do at all: it will break down in a week."

"I am certain to the contrary," said the inventor.

"Well, then, I will try both! and more, I will try anything you say will do, simply because you say it, if not involving much expense."

Some time elapsed before the work could be put in hand. The rail excited mirth amongst the officials. A fortnight was the utmost that prediction would allow for its durability; but days, weeks, and months passed, and it became a marvel to all concerned. For three years the small sample was under trial, and then the engineer of a neighbouring line was induced to try it also. A third engineer laid down two miles; and a fourth promised.

For six years it has now been under trial; it is demonstrably stronger than an equal quantity of materials otherwise disposed. The rail is safer, and free from damage: it is not exposed to the same amount of mischievous vibration, and it is not compounded of loose jolting parts. Moreover, it is actually 25 per cent. lower in cost and in maintenance. Public authorities approve it; but the humour of the thing is, that they who should use it profess to be afraid to use any-

thing "which is not in general use." Experience has tested it, and experiment is easy—but inertia is easier.

The wheel—the horse-foot wheel—was shown one day in model to another railway authority, who, if he reads this, may remember the circumstance. He thought it very remarkable, and proposed to have it constructed at ——. The inventor declined, alleging that they could not make it at that establishment.

"Why not?" said the honest and gentlemanly magnate.

"I will not explain why," said the inventor, "but they cannot do it. Give me authority to get it done, and it shall be done!" But he went on his way without the order.

A fortnight after he again saw the magnate.

"Well, I have shown your wheel to ——, and he is going to make some."

"I am obliged to you for your interest," replied the inventor, "but again I tell you that he cannot—or, if you prefer the phrase, will not—make them."

A month after that the magnate again saw the inventor, and informed him that the experiment had been unsuccessful.

But meanwhile a successful experiment was making on another line, where there was a will to succeed.

The public generally is not aware that the railway tyres next preferred to steel are of the iron called Low Moor, the highest priced of all iron. Staffordshire tyres are regarded with contempt, being only two-thirds the price of Low Moor. The horse-foot wheels of the inventor were purposely applied with Staffordshire tyres, and were put in competition with Low Moor tyres running in the same train, and applied in the ordinary manner. The result has been, that the Staffordshire lasted twice the time of the Low Moor. Costing two-thirds of the money, the durability was doubled.

And this was attained with greater absolute safety. The Low Moor tyres were pierced with holes to attach them to the wheels. The Staffordshire had no holes. The Low Moor were strained on hot. The Staffordshire were applied cold. The Low Moor were in tension. The Staffordshire were in a state of rest. The Low Moor sledged on the rails or curves, and produced torsion of the axles. The Staffordshire rolled with less sledging, and having no tension it was impossible they should break even in frost. They were elastic, like a horse's foot.

A neighbour line took heart of grace and applied these spring-tyred wheels to a locomotive engine, with what are called four coupled wheels. These also were Staffordshire tyres, and on driving-wheels the test was harder. For nine months these wheels worked on sharp curves and heavy gradients, till the boiler (being an old engine) became too old for safety.

An accident happened on a line, and it came out in evidence that the leading-wheel tyres of the engine were regularly worn down in two months, so that the flanges became too thin for safety, and the wheel-tyres had to be reduced in diameter about an inch to get up new flanges.

The inventor applied to the engineer to try his horse-foot tyres on the leading wheels of a similar engine working over the same sharp curves and steep gradients. The result proved that the horse-foot had four times the durability of the ordinary wheels.

"How is this to be accounted for?" asked the engineer.

Very simply. The flanges wear by a shearing action against the rails. A pair of shears will not cut metal unless the axis be perfectly firm. The ordinary wheel has the tyre firm, and it is shorn. The horse-foot wheel having an elastic tyre, it yields, and slips aside and will not shear.

An opportunity occurred on a distant line, also of sharp curves and steep gradients, where the tyres were rapidly worn out. Horse-foot tyres were applied to an engine with six wheels by an engineer who believed in the theory. In due time a report came to the following effect to the inventor:—

"Your tyres are going on quite satisfactorily. I had them made of common Staffordshire iron, and put under a six-wheeled coupled engine. They have now done a year's work, and through last winter's frost with heavy trains, and though this line is all heavy gradients, with the sand constantly in use to prevent slips, yet the wear has been very slight. I am so satisfied with them that I shall apply them to every new locomotive."

So the theory of our inventor was demonstrated in practice on three lines with the same results—inferior priced iron doing the work of the most costly—an iron of tough fibre not involving the risk of breakage belonging to the harder irons.

Thus, a rail and wheel exist in the principles of which safety nearly absolute and cost greatly reduced are found at the same time. So our inventor reasonably thought their use should extend.

On application to another engineer, pointing out the theory and fact, the inventor got the following reply: "It is all very true, but I am placed in a position of responsibility, and must protect myself. If an accident happens on my line by a wheel breaking, the jury, prompted by the plaintiff's solicitor, will ask whether I have paid the highest price and used a wheel in common use. If I answer in the affirmative, I am held harmless; but if I have obtained any wheels at a cheaper rate, or used a new system, I shall be condemned for using new-fangled plans, having more regard to the pockets of the shareholders than the public safety."

This is the dead-lock against railway improvement and railway safety.

Conversing with an intelligent gentleman in an official government position, the inventor remarked: "The companies are penny wise and pound foolish. They have a horror of small experiments, and yet notoriously rush into experiments on a large scale on sudden emergencies without any previous trial, under the pressure of public opinion. Were the companies to place at our disposal 10,000*l.* a-year for the purpose of verifying essential improvements by experiment, they would probably save an annual million and avoid a large amount of mechanical accidents."

This would be better than for whole bodies of directors and officers than to pass their lives under a system of indefinite responsibility. At this very time the system of permanent-way in common use in England with a reversible rail in cast-iron chairs with wood keys is disapproved by government officers, and were it now proposed as a new system would not be admitted. In case of an accident from a broken rail, the first question is, "Has it been reversed?"

Logical Sequence.—The primary source of all wear and tear on railways lies in the contact of the wheel and rail. If the wheel-tyre, of an inferior material, can be made to attain three-fold durability, *ergo*, the same effect must take place with the rails. This system, therefore, should have the effect of prolonging the life of the rail to its originally intended duration, twenty years, by reducing the destructive power of a thirty-five ton engine down to twenty tons or less; at the same time rendering derailment much more difficult, while materially lessening the total cost.

W. Bridges Adams.

THE CHANNEL FLEET IN THE CLYDE.

No event, that I recollect, ever occasioned so much excitement in this locality as the late arrival of a division of the channel fleet in the Clyde. As a proof of this, I may mention it is estimated that thirty thousand persons visited the fleet on Saturday week, and as many on the Monday following, when the squadron had been reinforced by another detachment of four ninety-gun ships, which arrived on Sunday. I left the Broomielaw on Saturday morning, 31st August, and on the way down by steamer, we passed a singular-looking machine full of passengers, which had stopped at Bowling to take in an additional cargo, and we had subsequently to wait for this at Greenock, as it was first on the list for seeing the show. As soon as she arrived at the quay, I and many others went on board. We naturally expected she would have put off for the fleet immediately—but no; the Glasgow railway train had not yet arrived, and we must wait for another reinforcement of passengers from it. The morning had been showery, but the rain had now ceased. It was a still *grey* day, such as we often see about the "fall of the year." I had plenty of time to look about me, and, although I had seen it more than a hundred times before, I never saw the scenery more exquisitely beautiful. Except when occasioned by the splash of a steamer, there was not a ripple on the waters, which had all the appearance of an immense lake; surrounded on one side by the mountains of Argyleshire ("Argyle's Bowling Green") and, more immediately opposite Greenock, by the hills above Helensburgh. There were few yachts in sight, but, besides a large man-of-war, a receiving ship, the bay was studded with craft of various kinds and sizes, chiefly merchantmen and a few steamers. We had not at this time a complete view of the channel fleet, which rode majestically off the "tail of the Bank;" not in any formal order, but here and there, as it were, promiscuously, with a moderate distance betwixt each vessel. Their names, and the order in which they lay, were the Revenge, 91 guns, Rear-Admiral Smart, which ship lay nearest to the "tail of the Bank;" Centurion, 80 guns, Captain H. D. Rogers, C.B.; Conqueror, 101 guns, Capt. E. S. Sotheby, C.B.; and Donegal, 101 guns, Capt. Sherard Osborne.

It was known beforehand that the Donegal, Capt. S. Osborne, was to be our destination. On rounding the "Tail of the Bank" we had a full view of the noble squadron. The ships were all so symmetrically proportioned that at first sight they appeared smaller than I had expected. It was only as we neared them, and compared them with other vessels that their immense size was distinguished. We were all packed close in our old "ark," like herrings in a barrel, and I have no doubt afforded much amusement to the jolly young tars who crowded the sides of the Donegal, or had climbed up the rigging, to see the visitors. It was a work of time to get such a multitude as we numbered on board the Donegal, and it was *beautiful* to see the care and attention with which the sailors appointed for the purpose assisted all of us, particularly the females of our party, in springing from the boat to make our way up the steep acclivity of the paddle-box. As one of the "old school," I have always been an enemy to the modern innovation of Turkish drawers in female attire—but when I saw young ladies of eighteen skipping up the sides of the ship with the agility and *nonchalance* of middies, I could see that, after all, there might be some use in this unfeminine habiliment.

On getting on deck I was struck with the beautiful order in which everything seemed to be arranged. The deck itself—240 feet long, and 55 feet broad—was like the flooring of a magnificent ball-room. There were few officers on deck, but there *were* a few of the juniors. Amongst them I could remark more than one type of that fine, oval, nut-brown, English countenance which Vandyke has immortalised on canvas. The men were chiefly fine young fellows, from eighteen to twenty-five apparently. I could perceive very few veterans amongst them.

The crowd of my fellow passengers soon broke up into small groups, admiring what they saw, and getting information from the sailors—who were most communicative—about the "ferlies." On putting a question or two to one of the crew—a fine young man of eighteen or twenty—about the working of the Armstrong guns, of which there were three on board, he not only replied very distinctly, but attached himself to me, and took me through the different parts of the ship, all of which he explained as well as "Tom Brown," or any other Oxonian professor of "muscular Christianity" could have done for the life of him. And yet I have reason to think that this fine young fellow was only a common sailor! On going through the lower deck we found part of the crew at dinner. I did not linger here, as I might have been deemed intrusive; but I could see there was a pleasant look of wholesome plenty all around. The day was rather warm, but these dining compartments were well ventilated. Apicius himself could not have desired a more salubrious room for his condiments.

I soon afterwards left my young friend, greatly delighted with all I had seen—a feeling which I may venture to say was shared by all the visitants of the fleet.

The local papers of this day (6th September) state that "yesterday afternoon six of the war ships sailed from the Tail of the Bank, and proceeded to sea." It is added, "The spectacle of so many large ships, and all so near each other, spreading their ample wings to invite the breeze, and passing onwards so majestically under a press of canvas, was highly impressive, as well as the skill and dexterity evinced by those employed in handling the vessels when staying." Geron.

WITHIN TWENTY MILES OF LONDON IN THE NINETEENTH CENTURY.

A desire to take rubbings of some ancient brasses led me a few days since to the quaint little church of ———, in Surrey, where I found so much that was interesting in the edifice itself, its curiously sculptured monuments, and the information freely given by the pleasant old clerk, that evening drew on before my task was half completed.

Unwilling to leave the neighbourhood without fully accomplishing the errand that led me into it, I made my way to a clean little hostelry where a comfortable bed was promised; and to wile away an hour or two, turned into the tap-room to fraternise with the good folks there, who were sleepily boosing over a roaring wood fire.

My entrance caused a little sensation, which might have been flattering to my vanity—(I have my share)—had not my nearest neighbour loudly whispered his impression that I was a packman, in which opinion the general company seemed instantly to coincide, for I was greeted with civil inquiries as to how I found business. With equal civility I assured them that it was *tolerable*, and knowing the Englishman to be a thirsty animal, who, while he would undoubtedly turn up his nose at the bread and salt of the Oriental, may be easily propitiated with malt liquor, ordered in some ale, which immediately put us on an amicable footing, and secured me the seat of honour in the chimney corner, where I underwent all the phases of hot, hotter, and intolerably hot, until I became as used to it as the rest of my new acquaintances.

Through the tobacco mist which floated round us, I surveyed the villagers as curiously, if less openly, as they had inspected me. Opposite, with his knees in constant danger of singeing, sat a blacksmith—old, ugly, and smutty as his great forefather, Vulcan. Next to him, a punch-like drayman, from the little brewery close by, which was apparently built on the model of my sister's doll-house. By his side lounged a tall, round-shouldered sawyer, the only one of the party who seemed interested in the newspaper, which he was spelling out in whispers to himself. There was also a shepherd redolent of haystack and cow-house, and three or four labourers from the adjacent farms, who had dropped in to enjoy an extra pint on the strength of its being Friday, or pay-night.

Conversation commenced with the weather, soaring to the moon, about which capricious lady a dispute arose, Bill contending that she changed her quarters at one o'clock; Jack standing out for another five minutes. An almanack proving both in the wrong, we fell back to earth and the *crops*, where I became hopelessly involved in *wheat*, *wuts*, *folium*, *roy grass*, and *turmuts*, receiving some excellent information, which shall be forwarded to my agricultural friends, as soon as it rises to the surface of my absorbing mind, in which it lies at the present moment too deeply embedded for extrication.

Our circle now received an addition, in the person of a middle-aged, hard-featured dame, who had been to "shop," and called with true feminine thoughtfulness to take "her Jack" safe home along with her. Jack somewhat ungraciously grunted out a command to sit down and wait till he was ready, so the seat I rose to offer was accepted, and Mrs. Jack warmed her feet, and nodded across the room to the sawyer, who, she confidentially told me, was a sort of relation. A very dry sort he looked; but we were not yet sufficiently intimate to venture on further inquiries.

Labourer Bill took his pipe out of his mouth to ask after *Simpson*. Mrs. Jack shook her head at the question—"He just is bad, poor man! norful bad! I looked in as I came by, and it's sad to see him; no rest, his missus says, night nor day. Ah! there's something about that chap more nor most people thinks!"

"What does the doctor say to un?" asked the blacksmith.

"Well," she answered, "he don't say *much*, and he don't do un a *mortal* of good. He says better send un to a hospital; but what's the use on it? Depend upon it there's a *spell* on him, and we pretty well guess who's done it."

"Do you believe such a thing *possible*, ma'am?" I exclaimed, opening my eyes with astonishment.

"Lord, sir!" she cried, turning sharply round on me, 'ain't it in the Bible about sperits and sich like? Don't you never read it? I ain't scholard enough myself, and Jack's eyes is bad; but our gal, she just do read it off quite pretty."

Mrs. Jack was too much for *me*, so I subsided into my Turkish bath, and heard without further comment.

The sawyer had laid down his paper and was looking up with an evident desire to proceed with Simpson's case.

"Then you think that's what ails him, missus?'

"There ain't no doubt about it," was the prompt reply, "and I just do feel for him, for I knows what it is myself."

The blacksmith put the question I was dying to ask.

"Did *you* ever have a *spell?*"

"Ah! didn't I!" she answered, "when I was a gal about twenty, and bad enough I lay all through the summer. We knowed who did it well enough; she wer the mother of the young man as courted me then, and she didn't like as us two should come together. So, at last, mother up and sent for a *cunning man*, and worn't he a clever one for fits! I knows lots he cured about here; it's a pity such clever folk should ever die, ain't it? Well, when he come, he says, 'You mustn't let any one in while I'm here!' But mother she wer

frightened like, and forgot to fasten the back door, and I'm blest if that wicked old wretch didn't come right in, and up to my bedside! Then the cunning man said it wer no use, he couldn't do nothing agen she, I must be sent right away; so mother sent me up to my aunt's in London, and in three months I was as well and as fat as a pig!"

As no one seemed inclined to raise a murmur of doubt on the conclusion of Mrs. Jack's story, I did not presume to do so, but swallowed it in another glass of the ale.

One of the labouring men, a good-humoured six-foot fellow, now entered the lists.

"I went to a cunning woman once; when them ducks of mine was stolen; you remember 'em, Bill?"

Yes, Bill perfectly remembered them; one was white with a streak on the wing, and t'other two, &c., &c.

"Well," continued six feet, "she holds up her finger at me, and says she:—

"'Ducks!—a running stream!—a dark woman! Go home, and don't let anybody know what I've told you, and your luck'll turn!'"

"I thought this worn't much for a shilling; but sure enough they were found next day!"

"Ha!" said the sawyer, gravely, "that arn't nothing to what I've seen and known!"

"And me, too," cried the drayman, pushing the red cap off his red little face and staring fiercely round, "when I wer about fourteen I chased a thing without a head for more than a mile, and then it got away from me over a hedge!"

"Like enough," interrupted Sawdust. "I've seen worse nor that myself!"

"And 'tain't very long," continued the drayman, "since I had my horses bewitched. We wer a going up a hill and they tugged and tugged, and I whipped and swore, but all for nought; up that hill they *couldn't* get. By-and-by, marm comes out herself, out of her cottage close handy, and says she—"

"'Why don't ye *whip* your horses, master?'

"'You faggot,' says I. 'I wish I had the burning of you! Take yourself off, or I'll come and thrash you as long as I can see you!' An' I made one step at her, an' off she goes, an' away goes my horses like wild cats! 'Tworn't long before we got to our journey's end, I can tell you!"

Every one drew a long breath and took a long draught but Sawdust, who solemnly repeated the assurance that it worn't nothing to what *he'd* seen.

"Then," asked Mrs. Jack, briskly, "if you knows more than other people, why don't you up and tell us all about it?"

"Because," he prophetically replied, "there was some one there as would only laugh at it, and sperits worn't to be made game of like that!"

"Queer goings on there is in this world!" exclaimed Vulcan, rubbing his roasted knees. "Wife always sticks a rusty knife over the head of our *bed-settle*, and that keeps away nightmare and all them sort o' hobgobbles; so, perhaps, that's how it is I never see nothing myself—but *twice*."

Every one was breathless with awe, only Mrs. Jack summoning courage to utter an interrogative "Well?"
